Special Notices to Subscribers, Correspondents, &c.

PREPARED COVERS.—We keep constantly on hand prepared covers for Volumes XI, XII, XIII, and XIV, which will be furnished at 25 cents each. These have stamped sides, and gilt backs, are uniform, and can be put on by any book-binder, at a cost of 25 cents. They can not be mailed very conveniently.

ANSWER TO INQUIRIES ABOUT BACK NUMBERS, &c.—Back numbers from the beginning of the present volume can still be supplied at 4 cents per number.

Volumes XI, XII, and XIII can be supplied at \$1 per volume unbound; or \$1.50 per volume bound.

The first ten volumes (new edition) can be furnished bound at \$1.25 per volume, or the complete set of ten volumes for \$10. Price of the first thirteen volumes \$14 50.

No new edition of the volumes above the tenth will be issued, as the work is too large to admit of stereotyping.

AGENTS' RECEIPTS, ETC.—A number of persons in different parts of the country have interested themselves in procuring subscribers for this paper, and we have not recently heard of any imposition practiced upon subscribers. Those more immediately connected with the Office are furnished with regular Office receipts, signed, and endorsed upon the margin, by the Conducting Editor, and when these are presented, no one need have the least hesitation in receiving them, as we do not give them out to irresponsible individuals.

When sending a subscription always state what number it shall commence with. The back numbers of this volume can still be supplied to new subscribers. Back volumes neatly bound can now be furnished from the commencement. Price of the first ten volumes \$1 25 each, or \$10 for the entire set of ten volumes.

We can generally furnish back numbers. Where only one or two may be wanting, no charge will be made to regular subscribers, and all numbers lost by mail we will cheerfully supply.

Correspondents will please keep matters relating to subscriptions on a separate part of the letter from communications for the paper, so that they may be separated.

Letters in regard to seeds, implements, books, &c., should not be mingled up with matters relating to the *American Agriculturist*. In this office we have no connection with any business whatever which does not relate directly to the affairs of the paper. When practical, we are glad to attend to any reasonable request made by any of our subscribers.

Paper is cheap, so is postage, and we earnestly request correspondents to write only on one side of the sheet; and further, that they will place their lines as widely apart as may be, so that in preparing articles for the printer, we can always have room between them to insert additions or corrections.

Postage is no higher paid at the office of delivery than if paid at the office where mailed, and as the "regulations" at the New York Post-office preclude us from paying by the quarter or year, it is useless for subscribers to send money for the pre-payment of postage, for we can not attend to paying postage fifty-two times a year for each subscriber.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by mail this is less convenient and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

SUBSCRIPTIONS can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September, as a half yearly volume of 416 pages, with a complete index, begins on each of those dates.

Clubs may add to their number at the same rate per copy as was paid by the original members.

The paper is stopped when the time for which it is paid expires. A notice or bill is usually sent in the last number.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then inclose them in presence of the Postmaster. Give the Post-office, and the County and State. Write these very plainly.

Those wishing their papers changed from one office to another, should give the name, County, and State, of their old and new Post-office.

PUBLISHERS' ANNOUNCEMENT!

THIRTEENTH VOLUME OF
THE AMERICAN AGRICULTURIST,
THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

The American Agriculturist,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

N. B.—The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume, for the bound work.

COMPREHENSIVE IN ITS CHARACTER.

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the Agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "Farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature, and they look for the united support of all the intelligent Farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor, by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of Agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers *only* that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon its *own merits*; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammelled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great Agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the joint Editorial supervision of Mr. A. B. ALLEN—its principal editor for the first ten years—and Mr. ORANGE JUDD, A. M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFF, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical Agriculture, and, in addition to these, number of other eminent Agricultural and Horticultural writers.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and Post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To, single Subscribers.....	\$2 00	A YEAR, \$2 00
" Clubs of 3 do.	1 67	" 5 00
" " 5 do.	1 60	" 8 00
" " 10 do.	1 50	" 15 00

The money always to accompany the names for which the paper is ordered.

The Postmaster, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Postmaster, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, Weekly Tribune, or Weekly Times, or any other paper or periodical in this City, the cost not exceeding two dollars per annum. The above are not given where book premiums are paid.

Subscriptions may be forwarded by mail at the risk of the Publishers, if inclosed and mailed in the presence of the Postmaster.

Communications for the paper should be addressed to the Editors; Subscriptions, Advertisements, and all matters relating to the business department, should be addressed to the Publishers,

ALLEN & CO., No. 189 Water-st., New-York.

AMERICAN AGRICULTURIST.

Designed to improve the Farmer, the Planter, and the Gardener.

AGRICULTURE IS THE MOST HEALTHY, THE MOST USEFUL, AND THE MOST NOBLE EMPLOYMENT OF MAN.—WASHINGTON.

PUBLISHED WEEKLY BY ALLEN & CO., 189 WATER ST.

VOL. XIII.—NO. 1.]

NEW-YORK, WEDNESDAY, SEPTEMBER 13, 1854.

[NEW SERIES.—NO. 53.]

FOR PROSPECTUS, TERMS, &c.,

SEE LAST PAGE.

PEAT FOR POTATOES.

WE have just finished an experiment, suggested by a friend, which shows pretty conclusively, the value of peat as a dressing for potatoes. From the fact that potatoes have almost uniformly done well in reclaimed peat swamps, even when the rot was extensive in other places, we inferred that it would be a good dressing for potatoes. The part of the garden selected for the experiment, had been trenched, and manured in the bottom of the trenches with the contents of the pig-sty. On the 24th of May, we planted three drills, about twenty feet in length, with large, sound potatoes. In drill No. 1, nothing was put. In No. 2, several bushels of peat, that had been thrown up for the action of the winter frosts upon it, were spread over the potatoes. In No. 3, one quart of guano was carefully sprinkled.

The potatoes were dug and weighed on the 31st of August. No. 1 gave 13 lbs.; No. 2, 21 lbs.; No. 3, 9 lbs. Those in the peat were much larger and fairer than the others, and lacked but a pound of equalling the weight of the other two rows. The season being exceedingly dry, has been unusually favorable to the success of the peat. It has retained the moisture, so that they have suffered less from drouth than the adjoining rows. It has been quite as unfavorable for the guano, that manure requiring to be plowed in the preceeding fall, or a wet season, to bring out all its virtues. It would not be safe to infer that peat was a better fertilizer than guano, though the product in this case was more than twice that of the guano. But the experiment justifies the conclusion that peat, decomposed by the frost, is an excellent application for potatoes. Let the farmers improve this drouth, to throw out large quantities, and expose it to the weather until spring, and then apply, in the hill, twenty-five cords to an acre of potatoes. We think it will be a safeguard against the rot, and most likely will secure a good yield.

We noticed that in another part of our garden, where potatoes were planted upon reclaimed salt marsh, they were remarkably smooth, free from rot, and of excellent quality. Our field potatoes are just harvested, and we have not discovered a rotten one among them. We have heard of little rot in this region, and the indication now is, that there will be five bushels of potatoes this fall in many places where there was only one bushel last fall.

SHEEP AND WOOL.

Wool at this time is twenty-five to thirty per cent. lower than it was last year in market, although it now sells as high as the average price for the last ten years preceeding the clip of 1852, when wool raising was considered by our farmers as a paying business. The year 1853 was an inflated year. Almost all commodities of American product had for years been approaching a culminating point. Railroads, real estate, especially in our growing cities and towns, farming lands at large—all increased in a ratio of value too rapid to be maintained. A foreign demand raised our grain to enormous prices, equal to the very highest of war-time and scarcity; and wool, unfortunately for the dealers and manufacturers, had the same tendency, though not to so great an extent. For the first time, in years, large quantities of wool were contracted for, all over the country, months in advance of the clipping season, at prices which resulted in heavy losses to the buyers. The market, of course, reacted, and now wool is down. Sales are dull, or if effected, they are at such low rates as to dissatisfy the producers.

Let us, however, look into it. Wool is still worth as much as it was in any one year from 1845 up to 1851, and more, by several cents per pound than during some of the intervening years. We know this experimentally, for we have grown and sold wool every year for the past ten years. Almost every winter of those years, up to 1850, millions of sheep in the aggregate, throughout the country, were slaughtered for their pelts and tallow alone. This was no great loss to the country, to be sure, for the most of them were miserable animals, yielding light fleeces of the lowest-priced wools, and they scarce worth feeding for mutton. Since then, beef has advanced largely in price, and mutton has followed it. Sheep have consequently increased in number; and for three years past, comparatively few have been so recklessly slaughtered for their pelts and tallow.

Now, the low price of wool begins to suggest the question to many, whether great numbers of sheep will not be taken to the shambles next winter for like objects? If our farmers, as in former days, chance to be discouraged by the present price of wool, and therefore set it down as a rule that sheep won't pay, of course millions of sheep will again be sacrificed. But we hope no such acts of folly will be committed. We American farmers, as well as others, are a very *spasmodic* class of people. When a thing is high in price, we rush into it—when a thing is low, we sell out. That is the *rule*. We have known farmers run from wool-growing, when wool was low, into dairying, when butter and

cheese were high, selling their sheep for a song, and buying cows at nearly double price. In three years time the tables turned upon them, butter and cheese fell, while wool came up again; and they, foolish enough to follow in the wake, just coming after in time so as to sell low and buy high at every turn of the scale!

We do not believe in such a system as this. Wool is a permanent staple of our agriculture, and as imperatively demanded by the population of the country as cotton, sugar, rice, beef, pork, or any other commodity. The tables of supply and demand will not always tally with each other. These will, at times, overbalance each other, and the intermediate parties who make the interchanges between the wool-grower and the manufacturer—that is, the wool-dealers—gain and loose, as the case may be, in the fluctuations of price. In the long run they make, at least they ought to make, a profit, for the use of their capital, and for the time and knowledge they devote to it. These men are a benefit to the wool-grower and the manufacturer both, taking his production from the door of the one, and delivering it at the warehouse of the other. It is his interest to pay all he can afford to the farmer, to secure his successive clips. It is also his interest to sell at fair prices to the manufacturer to maintain his custom. Occasionally there may be combinations among manufacturers and dealers to compel the grower to sell his wool at a low price; but these combinations are seldom got up, and they are always very hazardous; for after, all the consumption of the manufactured cloth regulates the price of the raw material. Thus the farmer stands on an equal footing with the dealer and manufacturer.

Last year the farmer had the advantage, decidedly. The wool-dealers and the manufacturers lost money. This year they intend not to repeat the operation, but to make a profit if possible. This they are entitled to, and the farmer should be willing. It is not for the farming interest that the purchasers of agricultural staples should become poor. They are, in reality, the brokers between the producer and consumer; and without the existence of such a class as this to bring the producer and consumer together, agricultural products would instantly fall twenty per cent. in value. Therefore, unsatisfactory as the present price of wool may be, it is probably all that it is worth to the purchaser.

We do not thus write to influence the judgment of any man in the sale of his wool. Wool-dealing is not our business; on the other hand, we have our last clip of a thousand pounds, safely stored away, for which we intend to take the first favorable offer we can get, be-

lieving that it will not, within the next two years, be above the present price, and the interest on the money. Others may think differently, and if they can hold it without inconvenience, and too much risk, they may be wise in doing so.

What we intended mainly, when commencing this article, was to enter our protest, in view of the present depressed wool market, against the farmer's sacrificing his flock, and abandoning the business for any other branch of husbandry equally liable in its turn to fluctuation. Unquestionably the high price of wool last year induced many of our flock-masters to keep over many unprofitable sheep, those which were old, poor breeders, and badly woolled. These may now be very properly drawn out, fed off, and sold to the butcher. Every flock should be well selected; none but substantial, healthy sheep, and among the females, good, promising breeders, with good fleeces, should be retained. Even in flocks devoted solely for mutton, a good fleece is an important item, as well as a good carcass; for at the season when mutton bears the best price, the pelt is at the highest value. A thorough culling of the flocks of the country the ensuing fall and winter, will very much reduce the numbers of their sheep; and the preservation of none but good ones in place of the bad, will add greatly to their future revenues, even at the same cost of keeping.

We sincerely wish that the American people would substitute mutton for beef and pork to a much greater extent than they have been in the habit of doing. Mutton is more nutritious and wholesome than beef even, and vastly more so than pork. In fact the latter ought not to be eaten at all, and especially the fat parts. Where on earth are there so healthy and robust-looking people as the English, of all classes? It is not simply the fogs and humidity of their climate which gives them their robust appearance and good looks; for people near them, with a climate almost like theirs, look very differently. So far as meats are concerned, they are mutton-eaters; probably more than half the animal food consumed in England being mutton. But it is not Merino, nor Saxony mutton—nor of the ragged, fence-jumping creatures commonly kept over large districts of the United States. English, Scotch, Welsh and Irish mutton is mainly of improved breeds, well bred, and thoroughly cared for. These we may have in as high perfection as they, by obtaining the breeds, and bestowing a little pains in their propagation and feeding. We are glad to know that the attention of many of our farmers is turning to that branch of stock, and we trust that the good taste and discrimination of consumers of meats, will give a substantial encouragement to their endeavors.

SHADE TREES.

THE late very severe storm of wind and rain, we hear from every part of its track, did much damage in blowing down trees, buildings, &c. It has occurred to me that the careful observer may derive some benefit from noticing its effect upon shade trees. It is true some fruit trees were entirely prostrated; but these generally were trees much advanced in decay, the effect of old age, worms, &c. But its varied effect upon shade trees, or their ability to stand high

winds, is worthy of notice. Purchasers in selecting shade trees will not be entirely indifferent to this fact—as it is, I say, one of much importance, inasmuch as buildings are often injured by limbs of trees blowing off and falling upon them. A willow tree blew down in our place during the late hard blow, almost demolishing a beautiful piazza.

Among the shade trees that I can mention off-hand, which will rank among those that are the most brittle in their joints, or weakjointed, are the willow, the soft maple, sycamore, the different varieties of poplar, and particularly the ailanthus and paper mulberry. The two last-mentioned are not worth cultivating, the former being extremely offensive to the touch, and scattering its seeds in every direction, which take root freely, thereby becoming a pest and a nuisance; the limbs also are very brashy and easily blow off. So with the paper mulberry. In exposed situations the joints easily part, thereby continually marring the beauty of the tree.

In planting trees along avenues and open lawns, due regard should be had for strength of wood, habit and form, as well as to the other points of beauty, symmetry, &c. W.

STABLES—SHEDS—CORN AND COB CRUSHERS.

HARRODSBERG, Ky., Aug. 27, 1854.

I AM about to build a cow-house, and am at a loss how to proceed. I have no pattern to go by, such things being very rare in this section of country. Can't you give me a plan that will be both convenient and economical? (a) Also, what is the advantage of feeding crushed corn over feeding it in the ear? and what is the best pattern of crushing mill? (b) NAT. LAFON.

(a) The best set of stables we found in Kentucky, were those of Mr. BENJAMIN GREY, of Versailles; but as this was twelve years ago, we presume many a good planter, nearer the residence of our correspondent there, has erected others after his excellent example. For plans of barns and stables, see back volumes of the *American Agriculturist*, which it would be hardly fair to our present subscribers in general, to republish at present. See also L. F. ALLEN's work on *Rural Architecture*, pages 286 to 310, where may be found engraved plans, specifications and descriptions. This work may be found at most of the bookstores. The price of the volume here is \$1 25.

(b) There are small mills here for crushing corn and the cob, moved by horse power, but they are not sufficiently strong for Kentucky work. The best method of grinding is, first to crush the corn and cob in a strong bark mill, and then pass it through common mill stones, dressed very coarse for this purpose. It requires a ten horse power at least to drive such a mill, and the power should be either steam or water, as so many horses together are not sufficiently steady in a dead pull.

A very good way to prepare corn for feeding—and perhaps as economical as grinding—is to boil it soft. This can be easily done in large water vats, by introducing steam into them, by lead pipes from a boiler heated over a small furnace. By having three or four vats or large hogsheads, the corn may be boiling in two vats, while it is cooling and being fed from the others. We presume boilers and pipe can be had in Louisville or Cincinnati. Any mason

can set it, and the vats can be easily constructed on the plantation from two-inch plank or thick staves.

MUCK FOR THE STABLE AND YARD.

Do not forget, in this dry season, to lay in large stores of this valuable absorbent for your manures. Many a swamp is now dry that has not seen the sun for years. The bottom of ponds is laid bare, and the mud is accessible in any desirable quantities.

If farmers improve their opportunities and draw out the mud, the drouth may, on the whole, prove a blessing, and the minus crops of this year may be more than made up to them, in the increasing yield of another season.

Dig, at least, ten loads for every horse, cow, and ox upon the farm, and by way of experiment, spread fifty half cords upon an acre of thin gravelly soil, where you mean to plant corn next year. Let the frosts and rains do their work upon it through the winter, plow it in next spring, put on your usual dressing of manure, and mark the result.

For the American Agriculturist.

IRISH GRAZIER SWINE.

ASHLAND, August 28, 1854.

I VENTURE to address you as the conductor of one of the principal agricultural journals in the country, for information respecting a race of hogs, perhaps more esteemed in this section of the country than any other. The hogs I refer to, are called here the *Irish Grazier*; and my impression is they were brought here originally from New-York. They are generally, if not always, white in color; and attaining great size and having a great share of bone, are perhaps better suited to drive to market than any other race. I do not believe there are now any pure bloods of the race in Kentucky, being usually mixed with Berkshire and Woburn. My object in making the inquiry, whether you or any of your correspondents know the race, and where they are to be found of pure blood, as I desire to obtain some of them. I will be greatly obliged for any information on the subject.

JAMES B. CLAY.

We do not know any pure bred Irish Graziers now in the United States. The most likely person to have them, is Mr. WM. NEFF, of Cincinnati, Ohio, as he imported some at different times about fourteen years since.

Although the *Grazier* originated in Ireland, we believe all those imported into Kentucky and Ohio, from 1834 to 1841, came from the neighborhood of Liverpool, England. We have no recollection of ever seeing them in New-York, although they may have been often brought to this State, or swine much like them.

There are large white hogs scattered through this State, which we think fully equal to the Irish Graziers; and they have a large white breed in Chester county, Pennsylvania, the best of which are very good. Mr. AARON CLEMENT, of Philadelphia, will give every information on this subject. They formerly had, and still may have, a fine large white hog called the *Miami*, in different places on that river, from 20 to 40 miles from Cincinnati.

We should think those hogs recently imported from England by Mr. BAGG, for the Kentucky company, would suit our correspondent for a cross on the native stock of the country. They are immensely large, and some of them quite fine. For dimensions, &c., see our last number, page 402.

A COTSWOLD BUCK.

THE PROPERTY OF THE MESSRS. HALLOCK AND
MR. JAMES SHERMAN, MILTON, N. Y.

THE above is an engraving from a daguerreotype, of the fine Cotswold buck we mentioned, page 385 of our last volume. It was taken last spring before he was sheared. It does not represent him quite as long as he is. It is almost impossible for a daguerreotype to do animals proper justice—they almost invariably fail in some point. However, any one who is a judge of this sort of stock, cannot fail to see the merit of this noble sheep, and may easily imagine, from a study of the daguerreotype, how he would look in reality. When we wrote the notice of Mr. HALLOCK's stock, &c., it escaped our memory to add, that Mr. SHERMAN was a part owner in him. We have now set this matter right.

BREEDING HORSES.

WE take the following remarks by "Cecil," from the Mark Lane Express, on the exhibition of horses at the late show of the Royal Agricultural Society. The observations are well worthy of regard in respect to the employment of stout thorough-bred stallions, and is as applicable to this country as to England.

We maintain that the breeder who is desirous to rear horses of the highest value, either as hunters or hacks, or indeed for any other purpose under the saddle, must have recourse to thorough-bred sires. And here it may be necessary to introduce a few brief remarks explanatory of the term. It implies a class of our domestic animals, whether it be of horses, cattle, sheep, or pigs, which is derived through a long race of ancestors, each of which has been selected with the utmost care for those superior qualifications which render them most useful and valuable. The thorough-bred horse undergoes the most severe probation in training, and in racing, where his powers of endurance, constitutional stamina, and soundness are unequivocally tested. It is the breeder's fault if he selects an animal for the purpose of procreation, which has proved himself defective in the most important qualities. The thorough-bred horse can sustain a greater share of labor and hardships than any other of the species. We sometimes see, but with regret, the worn-out racer doing duty in a London cab; or sustaining the abuse, and performing the drudgery of a village butcher's hack; sometimes carrying his inconsiderate master on the road, or his still

more inconsiderate boy, who too frequently indulges in a gallop against any one who will accept his challenge; at other times fastened to the gate, and shivering in the cold, while his master is closing a bargain at the farmer's hearth; after his day's work is over, the cold, bleak common is his resting place. In this pitiable condition he bears the hardships of his fate with courage, and withstands the variable effects of the elements to an extent far beyond what the mongrel can endure.

The proposition made by Mr. Spooner to breed from three-parts-bred sires capable of carrying sixteen stone with the fleetest hounds, as a means of regenerating our horses, was noticed in these columns at the time; it may further be observed, there is not such an animal in existence. No horse, unless he must be more highly bred than that which Mr. Spooner describes, can live with hounds when running.

There is another impediment in all cases where horses are used for breeding which are not thorough-bred—it is impossible to discover with accuracy worthy of dependence how such horses are descended; and to grovel on in the dark, in that respect, is a chance to which an experienced breeder of valuable stock would be reluctant to expose himself. The risk in this respect is often conspicuous with mares; and it is folly to render the probability of incestuous breeding doubly hazardous. It is universally understood by all practical and observant breeders that the male must be of pure descent if an approach to perfection is anticipated.

Would His Grace the Duke of Richmond seek to improve his beautiful flock of South-down sheep by the introduction of rams from the Welsh mountains? or would the late Earl Ducie have brought his herd of Short-horns to that perfection at which they had arrived when they were sold, if the common bulls of the county of Gloucester had been substituted for the highly-bred Short-horn? The mountain sheep and the common bulls more nearly represent the primitive animals of uncultivated nature than do the South-downs and the Short-horns; and the mongrel-bred horse is in a similar position.

It may be said that for many purposes more bone and power is required than are generally found in the thorough-bred horses. This can only be admitted to limited extent. If we were to select the most powerful of that class, very few, if any, of inferior breed could be found to equal them for any kind of labor in which the combination of strength and activity is required. It is obvious that thorough-bred horses endowed with those powers cannot be brought into use for ordinary occupations, in consequence of their value for other purposes; but they are the models to be taken as standards, and the nearer other classes of horses represent

them, the nearer they will arrive at perfection, and the more serviceable and valuable will they be.

Thorough-bred mares cannot be brought into general use to supply the country with their stock, because we do not possess a sufficient number of those which are endowed with the necessary qualifications; and they are mostly engaged in the costly service of breeding for the turf. To employ light, weedy, powerless animals is folly in the extreme.

THE BEST KIND OF MULES.

WE copy the following article from the Louisville Journal. It is written by a sensible practical farmer and stock-breeder, and we trust it will be read with attention. Mr. COCKRILL is unquestionably right in his views; and his observations are equally applicable to horses and working animals. With cattle merely destined for the butcher, and with sheep and swine, which are never worked, great size and the forcing system are not so reprehensible.

The mule is the great field laborer in the commanding staples of the South, cotton, sugar and rice, as he is one of the annual exports of Tennessee, and as he will continue to be so, he is destined to hold even a higher position than heretofore among the live stock of the State. Jacks of excessive heavy bone, or improper pampering, are generally lazy, or soon become so by labor, and become very slow; their driver may force them on, but in a few steps they take their slow natural steps again. Such mules are therefore almost worthless, and should not be bred if it can be avoided. The most perfect mules are not to be expected from the excessively large, coarse-boned jacks, or excessive high feeding, but from the laws of nature carried out to the greatest perfection by skilful breeding and feeding.

An error has existed for many years, and still exists, concerning the size of mules. Size has been made a measure of value in the mule, almost regardless of form and spirit, and so it has been in their size, the jack.

I have been employing a mule team for twenty-five years in the cultivation of cotton in Mississippi, and my team now numbers one hundred. In this time I have used every variety of the mule (except the most inferior kind) that has ever been grown.

At the commencement of my planting operations I adopted the prevalent error that size was the measure of value, and pursued it for many years, much to my prejudice. By long trials, and by comparing the relative performances and lastingness of the large team which I have used, aided by observation and reflection, I am fully satisfied that the medium-sized mule, full of spirit and of action, with a neat, firm leg, and round body, with his levers set right for easy motion, his head and ears up, ready to move at the word, is the animal of most value of his kind.

The laws of nature cannot be violated with impunity. The jack when grown within the scope of these laws is a small animal. The mule is a medium between the jack and horse. Both the jack and mule, by a hot-bed growth, may be forced to be large animals. But in this forcing process, now more extensively pursued by Kentucky than any other State, what has been gained and what lost?

They have gained large boned, coarse animals, of large size, and at an early age full of defects, and soon ready to decay, because subject to disease, and large consumers of food.

They have lost symmetry, spirit, action, lasting endurance, and permanent value.

The farmers of Kentucky seem not to have taken a proper distinction between animals intended for active labor and those intended for the slaughter pen.

The error that I especially aim at is the aban-

donment of almost every thing else for size. The best combination of the requisite qualities in the mule is not found in the production of a hot-bed policy, which by constant feeding, with every thing that will hasten growth, brings out a large, coarse, forced, overgrown, awkward animal, who decays as rapidly as he has been grown. If he were intended for the slaughter pen, this method of growing is correct, but when he is designed for the valleys of the Southern rivers, where his service is active and his rations not very select, he wants more game, more spirit and action, more symmetry, and not too much size. Hence, our Tennessee mules, the produce of spirited jacks, are really more valuable to the Southern planters than the produce of Kentucky under her present system.

This no doubt to some extent is the fault of the purchasers South, who have not generally discovered their error. They demand large sizes, and pay in proportion to size; and this, in part, explains the policy of Kentucky. My opinion is, that size in a mule is nothing after they reach fifteen hands high, and that many under that height come up to the standard value, fitted for cotton plantations.

When compared to the blood horse, the mule is unfit for the saddle, pleasure carriage, or any harness requiring rapid motion. His sire is an animal of slothful tendencies, of slow motion generally, and hence the necessity of improving this quality in the jack. Give him spirit and action, and stamina rather than great height. One conforms to the laws of nature, and the other violates them.

The Spanish and Maltese jacks have spirit generally, and for that reason are valuable as a cross; but they come to us without stamina and with a contracted chest. These faults must be remedied by proper crossing, before they will produce the mule best fitted for the malaria districts of the Southern rivers.

It is our policy to grow the mule that will prove to be most valuable to the cultivators of the South, and rely upon their following their interest when explained to them, and proven upon trial to be true.

What I have learned upon this subject is not from hearsay. I have purchased and grown all the mules which I have driven for twenty-five years in Mississippi. I have had that opportunity of knowing what they have done, and these opinions are the result of experience. This knowledge would have been of service to me in the commencement of my business, and I communicate it for the benefit of those who may adopt my opinion hereafter.

MARK R. COCKRILL.

Nashville, Tenn., June, 1854.

WEIGHT OF SEASONED WOOD.

The following table shows the weight of a cord of seasoned wood:

White ash,	3450 lbs.
Beach,	3236 "
Chestnut,	2333 "
White elm,	2592 "
Scaly bark hickory,	4469 "
Pignut hickory,	4241 "
Red heart hickory,	3705 "
Iron wood,	3218 "
Hard maple,	2878 "
Soft maple,	2668 "
White oak,	3821 "
Pin oak,	3539 "
Red oak,	3254 "
Chestnut oak,	3030 "
Pine,	1900 "
Lombardy poplar,	1774 "

THIRTY THOUSAND POUNDS OF HOPS ON TWENTY ACRES OF LAND.—Messrs. T. A. & A. P. Smith, of this town, have the greatest crop of hops ever known in the country. It is estimated by competent judges at 30,000 pounds. Hops are worth from 25 to 30 cents per pound. This crop grows on twenty acres of land.

Eight or nine thousand dollars is a round sum to realize from only 20 acres.—Watertown (N. Y.) Union.

For the American Agriculturist.

LETTER FROM WATERLOO, N. Y.

Wheat after Corn.—Saving fodder early.—It would do you good to see the great breadth of corn in this county cut up, now standing in rows, while the farmer is busily plowing the field for wheat. The fodder thus saved with the leaves yet green and the sugar in the stalks intact, is worth double ordinary late cut corn fodder; thus some good has grown out of the late trying drouth. Hay is short, corn ditto, and potatoes nothing; but we shall have more corn fodder by one-half than ever before, because the necessities of the farmer compel him to cut and cure it before its leaves and juices are wasted. When farmers have hay enough for winter, they let their corn stand until the advent of the early frosts, the result is, that the fodder has then lost much in bulk and most of its nutritious juices. It is supposed that one-third more corn was planted this year than last, but owing to the late spring, much of it being summer planted, it will be very light in the cereal yield; so that with all the good crops, and we shall have many, it is supposed that the general average will be only half a crop.

Soiled versus Starved Cows.—In all good gardens corn has filled and ripened as well as ever, when planted as early as the 10th of May. Stowell sweet corn, being a late variety, has attained a height of ten and eleven feet; its ears did not fill as well as other earlier sweet corn, but the juices of its stalk were never before so rich in saccharine. Beets attain a large size, and are uncommonly rich in sugar—the mangel wurtzel as sweet as the sugar beet. This season of hot weather and long drouth has taught our farmers a salutary lesson, to wit: That unless they tile drain so as to plant in the spring, they have no security against the drouth of summer. I never had in any season corn yield better in my garden, the late planted excepted. Here is a farmer who makes the butter for his large family, and supplies three other families from five cows. There is another who says he milks five cows into one pail, and makes not butter enough for his family. The discrepancy in the luck of the two farmers is accounted for, from the fact that the farmer has a patch of Indian corn, twelve rods square, sown broad-cast, adjoining his cow-yard, from which he soils his cows night and morning; the other man's cows starve in a burned up pasture. But the butter is nothing in compensation compared to the condition of the soiled animals; they will winter well, and be ready to give milk in the spring, while the starved cows will require the grass of a wet summer to make them whole. So much for a little patch of corn in a drouth.

A great season for Lima Beans.—We have had Lima beans this season in full perfection, two weeks earlier than last year; other beans, seed onions, and cabbages, are reduced by drouth. I have heard many disputations of late among practical farmers as to the capacity of soils to stand drouth. I take it that soil bears drouth best which holds the most water by capillary attraction and its own porosity, neither a clay, nor sand, nor gravelly loam, but a combination of all, with a perfect intermixture of dark vegetable or carbonaceous matter.

Wright's magnum bonum tobacco crop.—Joseph Wright has such a soil, thoroughly tile drained, on seven acres of which he has, so says a Kentucky planter, "the best crop of tobacco a Kentuckian ever saw;" had the season been less dry, the plants would probably have attained a more giant size, but the quality of the tobacco would perhaps have deteriorated in proportion.

Still slop, &c.—I see that the New-York press, and Tray, Blanche & Sweet-heart to back them, are down upon still fed cows' milk. Why is it that milk made like a Yankee's bones,

of Indian corn, is not wholesome, containing as it does, barring a little sugar and starch, all the elements of the corn itself. Methinks it would have been better and more humane, to give the cows a little marsh hay, more fresh air, exercise, and dryer and more cleanly lodgings, before the slop is so unphilosophically condemned.

N^o IMPORTE.

Waterloo, Sept. 2, 1852.

DUCKS.

I WOULD recommend no one to keep ducks, who has not the means of separating them from his fowls. When fed together, the latter are much in the predicament of the stork when he was invited by the fox to take his dinner off a platter. Like Amine, the ghoul, fowls pick grain by grain, but the duck does his work like a navy, by the shovelful. Their appetite being very great, they require a large range to enable them to pick up a fair proportion of their own keep, and if this space cannot be afforded, they will generally be found an unprofitable investment.

As regards rearing ducklings, I would simply recommend that they be kept from the water for at least a fortnight in fine, and a month in cold weather. If more than one brood is out at the same time, the old birds should be cooped, as a duck's bite is almost certain death. If you wish to rear ducks for breeding purposes, do not hatch them under a hen. Many persons always clip the tails of ducklings as soon as hatched. It may be a beneficial operation, and can certainly do no harm.

There are three kinds of duck that perch, of which I shall proceed to describe the Musk, the only one on which I feel myself qualified to speak. The Pintail and Wood duck, with many other varieties, I must leave to abler hands. Speaking as a man rather than ornithologist, I must pronounce the Musk duck to be a beast. Where there is an absence of water, it might be worth while to keep them, as they are as little of aquatic birds as any thing with webbed feet can well be. They do not lay so well as the common duck, and their eggs are smaller. Instead of being white, or green, or pale blue, or blackish, they are buff colored, and, as well as I can remember, (for it is long since I kept them,) they seem to be affected with an outbreak of measles in the form of minute specks. Their color is in general black, or black and white, though I have seen them pure white. They seldom utter any sound than a low hiss, and are so lazy that it requires some strong excitement to induce them to quack. They are a type of quaint old Fuller's dog, who was so indolent, that he used to support himself against a wall when he exerted himself to bark. I do not know or care whence the Musk duck comes or goes, as he is of little use whether alive or dead. In the latter case, he tastes very strong unless killed at an early age. As they will cross with the common duck, it may be worth while to breed for the table; but the produce must be killed young, which course would anticipate the advantage to be derived from the addition to the size. Whether the cross is productive, I cannot say, as, though I have had them, I never attempted to perpetuate the breed.

Here ends my gossip about ducks.

The dinner's waiting, I am tired,
Says reader, "So am I."

ALECTOR, in Poultry Chronicle.

PEAS GROWING IN POTATOES.—At a recent meeting of one of the French Agricultural Societies a curious fact was related. A farmer stuck a pea in a potato, and planted them together in March last. The pea produced a stalk which was covered with pods, and the potato gave eleven healthy roots. The farmer is of opinion that, by this system, it is possible not only to obtain a two-fold crop, but to prevent the malady in potatoes.

For the American Agriculturist.

ANIMAL INSTINCT.

THE BEST RECIPE IN THE WORLD FOR RAISING SHEEP.

I AM not prepared to say that farmer's cats and dogs have any more intelligence than the wayward and wandering pussies and curs that grow up in town; but as I happen to know of one or two remarkable cases of *cuteness*, I propose to relate them.

I saw a cat that would and did open a door that was latched, by jumping up to the latch and holding fast with one paw, while with the other it opened the door; and it made no difference on which side of the door she was, she would open it.

I knew of a farmer's dog that had a remarkable intelligent look in the face. The farmer had a son that lived about fifteen miles off. This son took the dog to his house to keep, but the next day it was back home. Some time after he thought he would try it again; and remarked in the dog's *hearing*, that he would take Juno again and one of her pups also. So when he was ready to start, the dog was no where to be found, and he was obliged to go without it. In the evening one of the neighbors called in to say that Juno brought her pups up there about noon, and snugly stowed them away in the barn.

Sheep raising in New-Jersey is at a very low ebb, in consequence of the laws failing to protect the sheep-growers from the depredations of the dog. One of the best jobs I ever heard of, was by a farmer who was building a stone wall. He was very much troubled with his neighbor's dogs killing his sheep. So to avoid a quarrel, he quietly killed one after another, and buried them as he went along under his stone wall. Great was the inquiry what became of the dogs, but nothing was ever heard from them. And so would I recommend to every one so troubled. Use one part strychnine to two parts pounded glass, throw it where the dogs may find it, and you will witness a marked improvement in the growing of sheep.

JEROME THORNE.

Salem, N. J., Sept. 1, 1854.

For the American Agriculturist.

THE POTATO CROP.

THE farmers are beginning to dig their potatoes, having learned in past years, the importance of storing the crop early. From all quarters in Eastern Connecticut, I hear favorable accounts. The rot has not made its appearance, the yield is respectable as to quantity, and the quality is first-rate. This crop will probably make up any deficiency of the corn crop, which is far from being a failure. The oat crop is good, and the market price has started at fifty-five cents. Farmers in this region, will do about as well as last year.

Stonington, Ct.

THE GAME BREEDER'S IDEAS OF THE SITTER'S INFLUENCE.—A Fancier of game fowls, and one who has fought many mains, informs me that he considers it all important, in breeding for the pit, to set a hen on her own eggs, or that they should be hatched under hens of the same breed. The argument used is that, inasmuch as the egg is porous, and the chick could not be hatched if the pores were closed with grease or other material, it necessarily absorbs with the heat of the hen some portion of her moisture, or nature, as he terms it; and that he has frequently had game cocks hatched under hens of other breeds, and though they were plucky and fought well a game or two, yet they invariably in the long run, showed the white feather and bolted, which he rarely knew a thorough-bred bird to do. If my informant's notions are correct, it behoves those who wish to breed first-class birds of *any breed* to attend to this suggestion, as it is equally probable that the form or feather may be affected if the *natural* habits of the bird are changed.

SHARP CATTLE TRADING.

ISLAND RIDGE, S. C.

THERE lived, a few years since, among the "Piney Woods," not far from here, a fellow whom we will call C—, who thought he knew something about making a bargain, and other people had good reasons to think so, too. By his "*cuteness*," C— had accumulated a considerable estate, and among other things owned a large stock of cattle. There being a sudden demand for cattle in a town not far off, a sharp fellow of a butcher, named A—, rode post from the city to buy some of C—'s cattle, and C—, ignorant of the rise in cattle, soon agreed to sell A— an hundred head at \$9, round. The bargain had not been made a couple of hours, before another butcher rode up to buy C—'s cattle, also, and C—, discovering the rise, felt he was "sold," but at the same time, *that he wasn't yet delivered*.

A— soon after learned that C— had a sister, who also had cattle for sale, and C—, bargaining for his sister, sold A— whatever cattle she might have, at \$12, round. The next day, at daylight, off went the parties to drive up the cattle, but nearly every cow and steer they found belonged to C—'s sister. Over and over again C— would say, "Ah! yonder is some. Them must be mine. My! sister's *agin*." And strange to say, though the neighbors had thought before that C— had a great many cattle, and "sister" very few, yet a hundred head were found belonging to C—'s sister, and the day's search could produce only five or six that belonged to C—. And A— paid \$12 a head for *sister's* cattle, and \$9 a head for C—'s, and drove away to his slaughter-pen.

But A— himself has a *reputation at a trade*, and five or six months after the "sale" of cattle, rode up into C—'s neighborhood on a very showy horse, and met C— *by accident*. "G-o-o-d m-o-r-n-i-n-g, S-i-r," said C—. "How are you?" The butcher returned the compliments, and very soon C—, who had been eyeing the horse, even before his very hearty salutation of the rider, asked, carelessly, if the horse was gentle. "As a lamb," said A—. "Draws, eh?" said C—. "Well, he does," replied A—, "*family* horse. Want to buy?" "Don't care if I do," said C—, "what will you take for him?" "Two seventy-five," said A—, "cheap at that." After considerable bargaining, C— found that A— would not fall a dollar, and as the horse was a dead match for one he owned, and he wanted a horse immediately for *steady work*, C— told A— he would take him if A— would drive him in a buggy. A— is a bold man, and believes in luck, so he put the horse in a buggy, and *that time* the horse *did draw gently*. The two seventy-five and the horse changed hands, and the first time C— put the horse to his *steady work*, the wagon went to pieces, the match horse got killed, and the late purchase went through the woods at the rate of —, with bits of harness on him.

Shortly after this, C— and A— met at *camp meeting*. "Mr. A—," said C—, with virtuous indignation, "how could you sell me your infernal horse?" "My infernal horse?" said A—. "'Twasn't mine—'twas my *sister's*."—*Spirit of the Times*.

DOGS AMONG SHEEP.—On Saturday night the 26th ult., three hounds belonging to Mr. Henry High, of Hampshire county, got into a flock of one hundred and ten sheep, of Mr. Frederick S. High's, near Purgitsville, in that county, and killed and crippled forty of them, with no hope of any of the crippled ones recovering. Those injured were fine Merino ewes, worth from \$2 to \$4 per head.

A CURIOSITY.—We were yesterday shown a wild duck with four legs and double breasted. The bird is a hermaphrodite, and is exceedingly large and fat. It is in possession of Mr. Henry Dunn, at No. 4 Water street.—*Boston Times*.

TOMATO FIGS.

WE have seen and tasted those delightful figs referred to in the following article from Hovey's excellent Horticultural Magazine; and endorse all which he says in their favor. We hope that those who raise abundance of tomatoes will save this recipe, and try the experiment, if only on a small scale.

Recipe for Tomato Figs.—Pour boiling water over the tomatoes, in order to remove the skin; then weigh them and place them in a stone jar, with as much sugar as you have tomatoes, and let them stand two days; then pour off the syrup, and boil and skin it until no scum rises. Then pour it over the tomatoes, and let them stand two days as before; then boil and skim again. After the third time they are fit to dry if the weather is good; if not, let them stand in the syrup until drying weather. Then place on large earthen plates or dishes, and put them in the sun to dry, which will take about a week, after which pack them down in small wooden boxes, with fine white sugar between every layer. Tomatoes prepared in this manner will keep for years.

A few apples cut up and boiled in the remainder of this syrup make a very nice sauce.—*Mrs. Eliza Marsh*.

It is only necessary for us to add, that the Committee of the Massachusetts Horticultural Society awarded Mrs. Marsh the Society's Silver Medal for excellent specimens exhibited November 29. They were tested by the Committee, and pronounced to be superior to any they had ever seen. They were put up in small boxes, and to our taste were far better than two-thirds of what are sold in our market for the best Smyrna figs.—*Horticultural Magazine*.

GREEN CORN PUDDING.—This is one of the numerous rural luxuries which the farmer has always the power to obtain at small expense. The following is the recipe for making it:

Take of green corn, full in the milk, twelve ears, and grate it. To this add one quart of sweet milk, one fourth of a pound of fresh butter, four eggs, well beaten, pepper and salt as much as may be deemed necessary; stir the ingredients well together, and bake in a buttered dish. Some add to the other ingredients a quarter pound of fine sugar, and eat with sauce. It is an excellent dish, cold or warm, with meat or sauce; but equires of the most "exquisite taste" declare for it, we believe, and with the first service.

BATTER PUDDING WITHOUT EGGS.—Mix six tea-spoonfuls of flour with a little milk, a tea-spoonful of salt, two tea-spoonfuls of beaten ginger, and two of the tincture of saffron. Mix it with nearly a quart of milk, and boil it an hour.—*Hammond*.

SUET keeps good all the year round if chopped and packed in a stone jar and covered by molasses.

RICE JELLY.—Put a tea-cupful of rice into half a pint of cold water. When the rice cracks, or begins to look white, add a pint of milk, and a quarter of a pound of sugar. Boil it until the rice is thoroughly dissolved, and flavor with lemon, cinnamon, &c., to suit the taste. Put it into a mould, or into tea-cups, and turn out when cold. Loaf sugar makes the most elegant and wholesome dish at any time.

OYSTER CORN CAKES.—A correspondent of the Germantown Telegraph, after several years' experience, gives the following recipe: To one quart of green corn, rasped with a coarse grater, add two teacups full of new milk and one of flour—mix well together, and add two eggs well beat up; season with salt and pepper, and bake upon a griddle.

SWEET-APPLE PUDDING.—Take one pint of scalded milk, half a pint of Indian meal, a tea-spoonful of salt, and six sweet apples cut into small pieces, and bake not less than three hours. The apples will afford an excellent, rich jelly.

Horticultural Department.

A NEW CURCULIO REMEDY.

CONSIDERABLE expectation is excited at the present time by the hope, that Mr. Matthew's remedy, now in process of trial, may prove successful. Certain it is, that an easy and perfect remedy would preserve to us a large amount of very fine fruit. No one has eaten the large and luscious Moor park or Peach Apricots—or Jefferson and Green Gage Plums, without earnestly wishing a protection from such a pest. Some remedies seem to be effectual for a time, in some seasons, and in some locations; but then they fail in others, just at the time, when they are most needed; and therefore the public look with no small suspicion on any proposed remedy, until it has received the most thorough trial for years.

On stepping into a friend's excellent fruit orchard in Connecticut last week, we saw plum trees by the dozen, of various varieties, literally loaded with clusters of fair fruit. We expressed our surprise and gratification, when he said, "Oh, I have found a remedy for the curculio, and it works perfectly." Then turning to some venerable apricot trees, continued, "Those trees had not ripened an apricot for twelve years, until three or four years ago, when I discovered this curculio remedy, but since then they are loaded with fruit every year as well as the plums."

On further conversation, he said he had not yet made his remedy public. His residence being one of the most retired in New-England, and although we could not obtain permission to report it for the benefit of our readers; yet we can say it is altogether the most probable and easy remedy that has yet been brought to our notice. It involves the application of neither lime, nor sulphur; and it is just such a discovery as a shrewd Yankee farmer would be likely to make; and it is so simple that every one can apply the remedy without stepping from his own premises, or going to the drug store for assistance. We shall experiment with it, and hold the remedy in reserve, in case others fail.

Occasionally a small tree was left without the application, and not a plum was to be seen on all of those, while trees in full bearing surrounded them so closely that the branches interlocked.

We shall wait patiently for the reports on Mr. Matthew's remedy, and earnestly hope it may be the thing needed.

For the American Agriculturist.

THE MECHANIC'S GARDEN.

WHEN a good thing is started, a good rule is to keep it going. An article in one of the late numbers of your paper, calls attention to what might be done in small gardens; and I then thought it the duty of some one who has had experience in the matter, to point out some of the most prominent errors in garden culture; and also propose a better method.

Mechanics generally have at their command only a moderate supply of means, consequently it is a matter of no small importance that they should be encouraged and directed aright in

matters of domestic economy. Let the mechanic and small farmer see that in supplying them with a family journal, you send into their circle a correct counterpart of what has been done, and what can still be done. Let them see that with a moderate outlay of industry and enterprise, they can enjoy such luxuries as strawberries, asparagus, raspberries, grapes, dwarf pears, plums, and such smaller fruits, and you at once gain their confidence, and encourage them to a trial. There is a way to manage a kitchen garden that will greatly abbreviate the labor. This is the heaviest item in the consideration of the mechanic.

A very common practice with some is, to commence the laying out a garden by digging miniature canals for walks, which is just so much useless labor, as the sides that are intended to represent a border, are continually crumbling down at every weeding, thus adding labor to labor; and if the ground is any way level, these canals receive the water of every shower. The very reverse of this is a better practice and a great saving of labor. The walks should generally be laid out at right angles, leaving squares that are *square*; and the walks should always be higher than the beds—(naturally wet gardens of course excepted,) then the water will run off the walks upon the square—the very place wanted. Also avoid having a border for vegetables or small fruit around the outside the garden, next the fence, as they will always be more or less injured by repairing fences. Then plant and cultivate every thing in *rows*, at right angles with your walks, and you will find the gardens much more easily kept clean.

The next best tool in a garden to a spade is a *scuffling hoe*. No one unacquainted with that tool can scarcely conceive its value. And any one that wants it had better apply to some agricultural store at once for one, if it is convenient. It is a hoe that cuts off the weeds by *pushing*, thereby enabling the operator to loosen the ground and leave it so; as he is not obliged to walk upon it after hoeing, as is the case with a common hoe. The hand-plow and cultivator are great labor-saving implements in the garden, and enable the operator to work the ground deeper, and stir it more thoroughly and evenly, than can be done with any series of hoes. With these implements, in a good friable soil, one person can easily do the work of three with hoes alone.

The next matter for consideration is the selection of plants for a small garden. The smaller fruits are best adapted for ornament and use, and in referring to this branch of gardening, I would add but one item more, which is, never depend upon your neighbors for fruit trees, such as suckers and sprouts—it is the worst economy in the world. Go at once, even at some sacrifice, if necessary, to some respectable nurseryman. Make known your wants, and let him select for you such plants as are known to be of value. Buy moderately and cultivate *experimentally*, making yearly additions to those that succeed. These brief directions, prudently followed, and you will never regret your acquaintance with the American Agriculturist.

By way of proof that mechanics can by their industry accomplish something, I will quote a part of a letter I have just received from a re-

cent mechanic, but now a farmer in Wisconsin. He says:

We are all well and enjoy good health—[mark that, good health—that priceless boon enjoyed more largely by farmers than any class of men on the face of the earth,] though pretty much worked down; having with the help of one man only—harvested some thirty acres of grain and grass. The fore part of the harvest season was warm and wet, the latter part hot; the thermometer from 90 to 100 in the shade, but upon the whole, favorable for harvest, which in Wisconsin is a bountiful one. Wheat, oats, grass and barley excellent; and corn, the best I ever saw; and, as far as I can hear, all tell the same story. Yesterday I went some 20 miles N. W. It is astonishing to see the stacks of grain the people have got together this season. I have got 80 acres of land, 35 of them cleared, worth about \$1,500. Timbered land, (unimproved land,) is worth about \$600 a lot of 80 acres. It costs \$10 per acre to clear and fence. The face of the land is rolling. I raise considerable produce to spare this year. I have six acres of winter wheat, yielding 25 to 30 bushels to the acre, and three and a half acres spring wheat. I will have 200 or 300 bushels of oats and corn; potatoes enough and some to spare. I have got a nice span of horses, have raised a pair of colts this summer, keep two cows, a few head of young cattle, and 47 sheep. The balance of my stock are swine, poultry, &c.

And now, Mr. Editor, this is from a mechanic; and all this is accomplished by hand labor. I offer it as exceedingly appropriate at this time, as positive proof that we do not propose impossibilities to the mechanic for digestion. How many of your city mechanics that pay high rents and city doctor's bills, can say this after twenty years of toil and labor.

W. D.

HOW TO LAY OUT A GOOD GARDEN.

TOWN, cottage or small suburban gardens, admit of little or no choice as regards style; they must be laid out principally in the geometric or regular order, for any attempt to introduce a gardenesque or picturesque arrangement, in so limited a space, will only result in an unnecessary waste of the ground, or a ridiculous attempt at landscape art. Many small gardens have been entirely ruined by the desire of the proprietors to have something in the rustic or natural style, without at once taking into consideration the extent of their grounds. It is no uncommon thing to see a garden of a quarter of an acre cut up into serpentine walks, in such a manner as to leave scarcely a spot of earth of sufficient size to plant a tree, or grow a dozen cabbage plants. There are some individuals who admire such a display, and regard it as a specimen of elaborate skill, but the man of true taste must look upon all such efforts as childish, and beneath the recognition of landscape art.

The general form in which town gardens are usually laid out is a parallelogram, ranging in width from fifty to one hundred feet, and in depth from fifty to two hundred feet. These lots are often uniform in size, and frequently form a continuous row for many hundred feet, or perhaps a mile in length. On the fronts of these lots the houses are erected, from five to thirty feet from the street, but oftener the first distance than the latter; an error upon which we must not omit to make a passing remark. Nothing, it appears to us, can be more objectionable than a dwelling immediately upon the street, and for various reasons it should always be avoided: 1st, the dust from the road; 2d, the absence of all privacy to the inmates; and 3d, the prevention of the planting of trees and shrubs between the house and the road. In a lot of one hundred or more feet in depth, no house should stand within fifteen or twenty feet of the street, and if thirty feet the better.

But whether a plot of ground selected for a

garden be a parallelogram, square, or any irregular shape, whether the sizes we have above mentioned or not, it cannot well be laid out in any other than the regular style, or a very slight departure from it. This question settled, other considerations arise as to shelter, shade, &c., for the planting of small gardens is materially affected by their position. Gardens in the rear of houses on a street running east and west, are much more shaded than those situated on a street running in any other direction; and of course are not so well adapted to the growth of some trees and plants, as those which have the full rays of the sun the greater part of the year; greenhouses or graperies when attached to such gardens must be at the extreme part of it, while in others they may be annexed to the house or immediately adjoin it. All these things are to be considered in laying out a complete suburban garden.

The ground decided upon, we shall suppose the house, if not already built, to stand thirty feet from the street, or about that distance; this will allow a good space for planting what we shall term the front garden. The back garden, supposing the house to cover thirty feet more, will be ninety feet long, allowing the lot to be one hundred and fifty feet deep. The whole of the ground, both front and back, should then be thoroughly trenched.

It is a very prevalent custom, if not a general one, even where trenching is performed, to confine this operation only to the ground to be planted, throwing the soil out of the walks, to make the borders deeper, and filling up the space with rubbish, gravel, &c.; but a little reflection will show that this practice is very objectionable, especially if fruit trees are to be planted on the borders, for the earth under the walks is just so much available room for the roots to extend and find nourishment, being equivalent in fact to so much additional garden-room. All that is necessary is to throw out the soil on the surface of the walks, to the depth of six inches, and fill the space with gravel; remembering, however, that all drains, if any are needed, should be made under the walks, which, if the location is retentive of moisture, will make them dry, firm, and comfortable at all seasons,—an important consideration, especially in spring and autumn, when a damp or muddy walk almost deters one from entering the garden, or at least destroys much of the enjoyment derived from a promenade through the grounds.

The front garden, of such a size as we have supposed, (thirty feet deep and of greater or less width,) should be laid out with a straight walk from the gate to the front door, or a circular one if the space is broad enough, and there are two entrance gates, one on each side. Nothing can be more objectionable than a curved walk on a level piece of ground, without any obvious reason to indicate the cause of such a curve. If a short bend is made in a walk, unless in the right direction, the object to be attained is defeated; for there will be perpetual attempts to take the nearest route to the main entrance to the house, and the grass or border, whichever it may be, will be crossed and re-crossed at all times. When the gate is directly in front of the house, the walk should be straight; when on one or both sides, unless the entrance door is on the side, it should be curved; for if made straight for some distance and then turned at a right angle, a foot path will be likely to be formed across the grass. Hence the necessity of varying the line of walk according to the situation, construction of the house, &c.; but as a general rule, easy curves in the shortest direction, or straight lines, should be the guiding principle in making walks to small gardens.

Another important consideration is, not to make too many walks. It is a common practice, even in the smallest front gardens, to have a walk within two or three feet of the boundary fence. This is not only unnecessary, but it destroys the only chance there is of forming a plantation of trees and shrubs where they are

most needed and look best, next the street. One walk only is necessary, unless the distance from the street to the house is more than 50 feet.

The width of walks varies from four to six feet, according to the size and character of the house and extent of ground, the average being about five feet. If a semi-circular walk, for the passage of carriages or vehicles of any description to the front door, it should be ten feet wide at least, and unless very limited for space, twelve feet. All these considerations being borne in mind, the walks can be staked out, gravelled and completed, and the ground made ready for planting.

The garden in the rear of the house should be laid out on the same principle we have advised above. If a square or parallelogram, run a neat walk parallel with the boundary fence, and four or six feet from it. This will leave a good space for fruit trees, as dwarfs or espaliers, or for grape vines or other climbing plants, trained to trellises against the fence, with gooseberries, raspberries, currants, &c., in front. On the other side should be a six foot border, if it is desirable to have a fruit garden, or choice shrubs and small growing trees if only an ornamental one. The interior compartment being devoted to beds of flowers and flowering plants, to strawberries, &c., or to rhubarb, asparagus, or other vegetables, or to all combined, just as the taste or inclination of the proprietor may desire; for on a piece of ground of the largest size we have named, (100 by 200 feet,) a great quantity of fruit and vegetables can be raised, after allowing a reasonable space for shrubs and flowers. But this cannot be done without considerable labor, and some expense. When a garden is to be laid out so as to be kept neat, without much expense, it should be mostly grass, and shrubs or trees. For a year or two, till the trees get well established, the ground should be cultivated; afterwards, it may be sown down to grass, when it will only need mowing occasionally to present a beautiful appearance at all times. There are many persons who have not the time to devote to the management of a garden requiring much attention, and who do not wish to be at the expense of keeping a gardener, or hiring labor; to all such there is nothing which will afford more gratification than a choice selection of trees and shrubs, both deciduous and evergreen, judiciously arranged so as to give variety at all seasons, and planted on a smooth and velvety turf. The less cross walks for gardens of this kind the better. Avoid this error. Let such walks as are necessary be broad, smooth and level; this will give character and expression to the garden, while a lot of narrow paths only fritters away all unity of appearance.

RECIPE FOR MAKING GRAPE WINE.—When the grapes are fully ripe, and have been removed from the vineyard to the place assigned for making the wine, they should be assorted, and all the green and decayed ones removed. Then put them into a barrel, about a bushel at a time, stems and grapes, and pound them thoroughly till all the grapes are mashed. Continue the process till all are finished that you wish to make up at that time. The next process is to press out the juice or must. Then to every gallon add two pounds of sugar, and stir it thoroughly till all the sugar is dissolved. It is then put into barrels for the purpose of fermentation, there to remain, with frequent filling up to supply the waste, till the pomace is all fermented off. A supply of the must should be on hand for that purpose. The barrels should not be bunged up until the fermenting process is about completed. This may be easily ascertained by placing your ear to the bung. If in April or May the wine should be found clear, it may be racked off, but if unsettled it should be left till fall. If the wine is found to be just what you want it at the time of racking, bottle as much as you choose; but if not, let it remain on the lees, and the article will increase in character and strength.

I would remark that all grapes raised in this section of the country, do not contain enough sugar or saccharine matter to make good wine without the addition of sugar.—*H. N. L., in Rural New-Yorker.*

APPLES AT THE WEST.—Letters from residents in the western part of the State of Ohio, mention that the crop of apples in that vicinity is very large, and the fruit is sold at low rates. Good apples are plenty at from 30 to 40 cents a bushel.

APPLES IN OHIO.—There is a great apple crop in Western Ohio, where good ones are in abundance at 30 cents a bushel.

TO DESTROY VERMIN IN HOUSES.—Take up your carpets—down your curtains. In a pailful of water (cold) mix well one pound of chloride of lime—having first diluted it into a thin paste in a bowl of water, for facility of mixture.) With a mop, wet and saturate well the floor, skirtings, and any other wood work that will not suffer injury. Then shut the doors and windows close. If there should be a suspicion of other tenants in the bedstead, take that down too. In three or four hours all will have disappeared or perished; but to insure perfect immunity from the plague, it might be well to repeat the lustration a second time—*i. e.*, a day or two after.

CANINE SAGACITY.—A correspondent of the *Rome Sentinel* tells a story of a wonderful dog residing in the western part of that town. A farmer named Donnelly sent his boy to watch a lot of cows. While in the field the lad was taken alarmingly ill, and became entirely helpless. His dog left him and went to the adjoining field, where a young man was at work, and by repeatedly going up to him, and then running a few rods toward the place where the boy lay, succeeded in attracting his attention, until the young man followed him, found his young master, and by applying cold water and other restoratives, he was able to get the lad home, who has since been restored to health.

AMERICAN WOMEN.—The following charming passage is from "*Rural Hours*," by Miss Cooper, daughter of the late J. Fennimore Cooper. It so beautifully expresses the sentiments of all women of pure feelings and correct principles, that it should be widely circulated:

We American women certainly owe a debt of gratitude to our countrymen for their kindness and consideration of us generally. Gallantry may not always take a graceful form in this part of the world, and mere flattery may be worth as little here as elsewhere; but there is a glow of general feeling toward women in the hearts of most American men, that is highly honorable to them as a nation and as individuals. In no country is the protection given to woman's helplessness more full and free—in no country is the assistance she receives from the strong arm so general—and no where does her weakness meet with more forbearance and consideration. Under such circumstances, it must be woman's own fault if she be not thoroughly respected also. The position accorded to her is favorable; it remains for her to fill it in a manner worthy her own sex, gratefully, kindly and simply; with truth and modesty of heart and life; unwavering fidelity of feeling and principle; with patience, cheerfulness and sweetness of temper—no unfit return to those who smooth the daily path for her.

THE MISERIES OF EDITING.—An editor at the dinner-table, being asked if he would take some pudding, replied in fit of abstraction, "Owing to crowd of other matter, I am unable to find room for it."

American Agriculturist.

New-York, Wednesday, September 13, 1854.

N. B.—*This paper is never sent where it is not considered paid for.* We often send out specimen numbers to individuals, sometimes at the request of their friends, and sometimes of our own accord. Those receiving them need not return them, or fear a bill will afterwards be sent for the same. These single numbers are designed as an invitation to the receiver to examine, and if they like the paper, to subscribe for it.

EXTRA BACK NUMBERS.—Of volume XI. and XII. we have parted with every copy of the first number in each, even to our office copy, which was somewhat cut up. Of the other numbers we have still a few extra copies, besides our regular sets, which we will be happy to supply free—as long as they last—to those wishing to complete their files.

LATE TURNIPS.

THERE is many a small patch in the garden, that may be sown in turnips, so late as September. The Red Strap Leaf is the best variety for late sowing, and the Red Top is the next best. The turnip will grow until late in November; until the ground begins to freeze. Last year we sowed where we had early cabbages, and in some other spots, and had over twenty bushels of beautiful bulbs, where nothing would have grown without them.

The ground should be hoed over, and dressed with super-phosphate of lime, or a little guano, and then rake in the seed. If the fall should be wet, you will have turnips enough for your table through the winter, on a very small piece of land.

Squash and cucumber vines are beginning to die, the early beets are gone, and the onions are already gathered. Sow the vacant spots with the Strap Leaf turnip, and see what comes of it.

COMPENSATION FROM THE SUMMER'S DROUTH.

WE have no doubt the long continued drouth will result in the utter extermination of myriads of insects, worms, animaculæ, &c., throughout extensive sections of the Union, which have hitherto proved highly detrimental to our valuable crops. A Southern paper says, that the joint-worm has been annihilated in many wheat fields, having become dried to powder before arriving at maturity and shedding their pestiferous brood for another season's ravages.

This is one way that our farmers may be compensated for their short crops. If they are further taught economy in feeding what they have, only to animals that can best digest and make a suitable return for their food, and in an economical manner; if it will further teach them to plant early, and have their fields deeply plowed, well pulverized and manured, so as to afford a continued though partial supply of moisture from the atmosphere, during even the driest time, then they will have received ample compensation for the limited diminution of their present season's crops.

RAISING TURKEYS.

SOME months since, we gave an article on this subject which has been extensively copied into other agricultural journals, indicating a general approval of its suggestions. We had, at the time of penning that, more to say on the subject, but postponed it until another summer's trial should confirm our practice of previous years.

For several years past we have raised from four to six hens, fifty to sixty turkeys every season. We have always succeeded best with the young of old birds; that is, the produce of a cock and hens of two years old and upwards. This year we have the produce of seven hens amounting to seventy-one in number, and finer or more robust young birds never ranged a field. The trying time for young turkeys is the first and sixth or seventh weeks of their lives. Our plan of raising them is this: Desiring to be rid of the noise and dirt of the poultry immediately about the farm-house, we transfer the turkey stock to a small cottage at a little distance, where one of the farm laborers resides, whose wife is a good poultry nurse. By a good poultry nurse, we mean one who loves poultry, and takes pleasure in looking after and feeding them when well, and nursing them when sick or lame; one, in fact, who is willing to take any pains that may be necessary for their welfare; and this a woman who has responsible household cares on her mind, will scarcely be apt to do.

By way of episode, we will illustrate our meaning. One season we wished to raise an early clutch or two of Dorking chickens, and as we kept them about the dwelling, we did not want to bother with them thus unseasonably. Old JIMMY, our Irish factotum about the yard, soon hunted up a woman in a laborer's cottage not far off, who engaged to take the hen and eggs, and do up the hatching and nursing by contract. About the time the hatching was expected, we, with JIMMY as guide, strolled out to the shanty to see the result of the incubation. "And where, my good woman, are the chickens?" "Sure, and be seated a minute, sir, and you'll see them; and nater birds ye niver cast eyes on." So, down we sat. She ran to the bed, and from beneath it drew out an old basket half filled with rags, where was snugly stored the rejoicing mother and her fourteen chickens, as blithe and chirping as crickets! "But you have'n't had this hen under your bed these three weeks?" "And where away else would ye had it? Is'n't it war-rm and comfortable, and can't we feed her from the table? And sartin its no throuble she makes me; but good company, clucking now and thin while the ould man and the childer are away!" We could say no more, but acquiesced in the successful practice of our redoubtable Dorking nurse.

Another day JIMMY discovered a hen just off her nest with a clutch of chickens, among which were a couple of feeble ones, altogether too weak to contest with the others the warmest nook under the mother's wing. We told him to take them into the house, and put them in a basket near the fire, with a flannel spread over them. He disappeared, and soon came out, saying that BIDDY, a good natured Irish servant maid, who did the scrubbing and washing, would attend to them. A few hours afterwards we thought of

the chickens, and went into the kitchen to ask BIDDY how they were. "Och, nicely, nicely, sir. They were very poor and wake; and I gived them a little bread soaked in warm milk, and they are now as pert as daisies." We fancied we heard a queer sort of complacent chicken chirp about BIDDY herself, and asked her where the chickens were; we wanted to see them. "Why sure, and here they are, sir, as happy as little larks." At which the benevolent BIDDY, suiting the action to the word, unpinned in front the upper section of her dress—for she was a stout, buxom lass, with a fresh, ruddy complexion—and in all the unembarrassed innocence of her nature, drew out from their warm, luxurious nestling place—a perfect chicken Paradise!—the chirping little birds, which she held up to us with all the triumph imaginable. "Well, BIDDY, you are a chicken nurse, to be sure! Is that the way you treat chickens in Ireland?" "Oh, and indade it is, sir; many is the dhrooping chicken I've saved that away; and so my mither always did her's, bating when the young baby was too busy pulling at the buzzum!" We never doubted the efficacy of either Mrs. O'SHADRACH's practice at incubation, or BIDDY's method in the restoration of enfeebled chickens thereafter; and such are the nurses to which we hand over the rearing of our turkeys.

We give the poultry woman one quarter of all the young ones she can raise, and usually buy out her share about the first of October, when they no longer need looking after, or to be driven up to shelter. This is the best incentive to their care, and as we find the food, they are not stinted when young. After they begin to range, they need no feeding, excepting a little when they come up at night.

The best food for young turkeys is curds made of sour milk. After being fed on this a few days, they should have Indian corn-meal pudding, well boiled into a mush—as well cooked as if for the table. Raw Indian pudding scours them. To these should be added all the sour, or sweet—no matter which—skimmed milk they will drink. They will pick a good deal of grass, if they can get it, catch flies and other insects, and lie a great deal in the sun, if they have a sunny place to lie in. Sunshine is a great promoter of health and growth in all young animals; and they should always have it, if possible. They should not run at large until "the red" begins to show sensibly on their heads, which is about the time they arrive at the size of a half grown chicken, or are six to seven weeks old; nor until the grass is mowed, if you have meadows about the premises, and the grasshoppers get plenty. Then they may range for themselves, and if insects abound, will grow surprisingly. While the chicks are young the hens should be confined in large, roomy coops. Our method is to lay up common rails, cob-house fashion, to the height of about three feet from the ground on a piece of clean grass. These we cover with boards, slanting, to shed the rain. This will give the hens all the exercise they need—for turkeys must have exercise—and they will be healthier than in a narrower space. If the mother hens do not quarrel, such a pen, ten feet square in the clear, will hold four or five of them, with fifty young ones, if removed to a clean spot once a week.

Such is our method of rearing turkeys; and the flock, fine, rampant and gobbling, is just as sure to come round every autumn, as our grass or our grain crop. In this way they have never been troublesome to the farm; but bred, helter-skelter, as allowed by too many, without care, the mother hens laying abroad in the fields and woods, their young are mostly lost by vermin and accident; those that survive are a continual pest to the farm; and in the end are neither a pleasure nor profit to their owners; while properly bred, they give both pleasure in their rearing, and profit in their consumption, while they feast the eye with a moving picture of luxury and beauty.

THE CORN CROP—THE DROUTH.

SEVERAL very popular—and we will add as a general rule—ably-conducted journals in the United States, have taken great pains within a few weeks past to alarm the country on the subject of the drouth, and the consequent great deficiency of the corn crop. It was but a short time previously, they were prophesying that wheat would be down in this market to \$1.30 per bushel, and corn to 60 cts. This was one extreme; now they go to another, painfully exciting the apprehensions of the laboring classes, lest corn and potatoes, owing to the short yield and high prices, will be measurably beyond their reach the coming winter.

Gentlemen, instead of indulging in such alarming editorials, suppose you had taken a turn among the farmers in your respective districts, and obtained accurate statistics of the amount of their products last year, and the probable amount of all kinds this year; then you would have had more reliable data on which to have founded your opinions, and the people would have listened to you with much greater confidence and respect.

From the best information we can obtain, one-fifth more corn was planted last spring, than was ever before done in the United States. It is generally acknowledged that these crops north of the line of latitude 42°, and south of 35°, will be a full average. But in that belt of land lying between these extremes, especially west of the Alleghanies—the great corn producing region of our country—it is the opinion of some that there will be a decline of 25 to 30 per cent; while others contend that owing to the greatly increased breadth of land planted this season, and the late reviving showers, there will not be a deficiency of over 15 to 20 per cent. That this last opinion may be the more correct we have reason to believe; and to substantiate it, we copy the following items from some of our exchanges published in the region of which we are now speaking. Many more of similar extracts could be given from the papers of Kentucky, Tennessee, Arkansas, Missouri, Illinois, Indiana and Ohio, if it were deemed necessary to strengthen this position.

From the Louisville (Ky.) Journal:—In conversation with a farmer in this county and an observant gentleman of Clark county, Indiana, the former informed us that he would make 70 bushels corn to the acre, and in Clark the yield would average 30 bushels to the acre. If these statements are correct, it would seem to indicate that the corn crop will not be as deficient as supposed, particularly in the vicinity of the Ohio river.

From the Chattanooga (Tenn.) Advertiser:—Corn is very much improved by the recent rains. We have met many friends from different sections of the country, and from them we gather that this crop will not be much of a failure after all. We have news also from South Georgia and Alabama, which speak very encouragingly of the prospects. It is very seldom that Tennessee fails in her corn crop, and although it has suffered much, we are not without hope that the corn will average a crop.

Aside from the late more cheering advices, it must be recollected that an extra large quantity of old corn is still on hand in the great west; and that wheat, rye, barley and oats this season have been a full, if not more than an average. Add to this, potatoes have not suffered more this season from the drouth than they did the past from the rot; and then under the new reciprocity treaty, Canada will pour a large surplus of her wheat crop into the United States, estimated at about twelve million bushels more than she has ever before grown. Thus we think there is little fear but our wants will be fully supplied for the coming year; and that there is no necessity for a panic, or a further rise in breadstuffs and vegetables. And so it seems, now think the operators in these articles, for corn and some other things have fallen more or less in their prices within the past few weeks.

There is another important reason why prices should not advance. The European harvests are nearly over, and have proved to be a full average; thus the demand from this quarter, for the breadstuffs of America, will be nothing comparatively to what it was last year, when the crops were so very deficient. We presume also that there will be greater economy practiced at the West in feeding corn to their stock this season; and we devoutly hope that not a few distilleries will be stopped converting this inestimable grain into liquid poison—a curse to the country and its people.

WHAT ARE TEETH MADE FOR?

EVERY one will answer to masticate or grind up food. Yet how few use them for this purpose. They are principally used to cut up food small enough to have it pass through the capacious œsophagus (or meat pipe) into the stomach.

If we wish to dissolve sugar or any other substance quickly, we pulverize it finely. But who thinks of pulverizing a potato finely before it goes into the stomach to be dissolved. As a potato is usually swallowed it is more than half in small lumps from the size of a pea to that of a chestnut. These lumps go into the stomach, and the dissolving fluid (gastric juice) can only act upon the surface, so that it is a long time before the whole is dissolved, and very often these lumps leave the stomach and go unchanged through the whole 25 feet of the intestinal canal, producing irritation all the way. If, on the contrary, the potato had been mashed in the mouth or on the plate so that every portion should have been as small as fine sand, the gastric juice would have quickly dissolved the whole, and it would have been changed into nutriment.

What is said of potatoes applies to other food. If apples and other fruits were entirely ground up they would be far less injurious. Children are so little taught on this subject, that we see them straining and stretching their necks to get

down a piece of meat, which will lie for hours an internal poultice, before it can be dissolved or digested. Pieces of apples, potatoes, &c., pass through the system unchanged while they have irritated the whole food channel.

We have said nothing in regard to the fermentation that takes place in most kinds of food, when lying undigested for three or four hours in the stomach.

A GOOD TOOTH POWDER.

WE never have occasion for tooth powders of any kind. A hard, stiff brush, vigorously used upon, around, and between the teeth with cold water only, is quite sufficient to keep them in good order, especially if care is taken to clean them *just before going to bed*, so that no food will remain to corrode them during the night. If any thing more than the brush is wanted, a little soap is excellent. But many persons wish for tooth powders, and we will here give them a recipe for making one of the very best, both in regard to quality and cost. It was furnished us by a medical friend of this city, and we can vouch for its good chemical qualities. The chalk is for cleaning and polishing, the soda for neutralizing any acids upon the teeth, the sugar and other substances for making the article pleasant to the mouth.

Take two ounces of finely prepared chalk, one ounce of bicarbonate of soda, and one ounce of dry sugar and rub them thoroughly together. If a beautiful or rather fashionable color is desired, add a little Dron Lake, or dry, ground Sanders Wood. An agreeable odor may be given by adding a little essence or oil of wintergreen, rose, bergamot, or whatever suits the fancy. All the above materials can be procured of any druggist for a few pence, and a quarter of a pound of powder thus be made of a better and safer quality than nine-tenths of that sold at twenty-five cents an ounce or higher.

ERRATA.—In our last number on page 401, for "land" in first and second column read *sand*. For "bushels" of oats and wheat in third column read *acres*.

THE ROUP.

THE disease described by our correspondent below, is called the roup. It is prescribed for fully in every good work on poultry, and is easily cured if taken in time. The following is our remedy, which we have practised with success for years.

In cold weather wash the head of the fowl with warm soap-suds, from two to four times a day, as it may require. In warm weather, cold soap-suds is the best. Then take a pin or small awl, and open the nostrils well, so that it can breathe freely. After this operation, give a teaspoonful of sweet oil or butter, if a small hen, and more if a large one; and keep her in a warm place in winter, and a shady one in summer. Feed lightly when ill, with Indian meal dough, or mush unsalted, or other light food.

Fowls get the roup more frequently from being too closely confined, or for want of fresh air than from any other cause.

SAYVILLE, L. I., Sept. 4, 1854.

Lately my hens have become partly diseased, the remedy for which I cannot find in any work on poultry I possess. They lay no eggs. The

symptoms are a short, shrill cough, as if trying to throw up something. A discharge from the eyes and nostrils, an offensive smell, a wasting away of the flesh to the back bone, when their eyes close and swell out full of matter; and thus they give up the ghost. If possible, please give me a remedy. H. M. K.

DEATH OF MRS. JUDD.

THE following notice is taken from the Lima (N. Y.) Weekly Visitor, of 9th inst.

DIED.—In New-York City, September 2d, MRS. SARAH F. JUDD, wife of ORANGE JUDD, Esq., Editor of the American Agriculturist. She was buried in the Methodist Cemetery of this Village on Tuesday. Aged 33 years, 8 months and 8 days.

It will be gratifying to the numerous friends of the deceased in Lima, where she formerly resided, to learn that she died in the full triumphs of faith. Her disease, rectal hemorrhage, was of several weeks continuance; but, with one exception, it did not appear to be very dangerous till within a few hours of her death. She had, however, strong presentiments of her approaching end, and had two months before arranged all her family affairs, and directed the manner of distributing her articles of dress, books, &c., among her various friends.

She had also set her spiritual house in order, and with a calm, unclouded trust in her Redeemer, peacefully waited His call. During her last hours she conversed freely with those around her, and left messages for her absent friends. As her life was ebbing away, bright visions of a blissful immortality opened to her view, and her three children who had gone before, seemed visibly to appear, to accompany her through the dark valley and shadow of death. Her only anxiety was for an infant daughter; but with a strong trust in the goodness of God, she cheerfully committed it to the same hands which had taken herself when an orphan child, and guided her youthful steps, and led her in early life to the house of prayer, and to the altar of mercy.

Those who here knew her many years as a member of the choir, a teacher in the Sabbath-school, a punctual attendant at the class-meeting, an affectionate and motherly sister in the home of her adoption, will well believe that during her ten years' residence in other circles, she has ever been found an active and useful member in the church, and preëminently a most faithful and deservedly beloved wife to her now desolate husband. In the removal of one in the prime of life who gave such assurance of filling a useful sphere, we are taught that God's dealings are often mysterious. We can scarcely fathom the mystery. How true it is that

"The good die first,
While those whose hearts are dry as summer's dust
Burn to the socket."

Good qualities, like great abilities, are incomprehensible and inconceivable to such as are deprived of them.

NOTHING begets confidence sooner than punctuality. Nothing so well becomes true feminine beauty as simplicity.

He who knows the world will not be too bashful, and he who knows himself will never be impudent.

Be quick in resolving, and bold and determined in executing.

Scrap-Book.

SCRAP-BOOK—ITS DESIGN.—While our paper is designed to be chiefly devoted to agricultural matters, and to such subjects as relate to the health and comfort of those engaged in tilling the soil, we think it not inappropriate to devote a page or so in each number, to a collection of some of the choicest extracts which we find in looking over many foreign and domestic journals. We have met with few families, where it is not customary for the younger members to gather up bits of wit or sentiment, and paste them into a "scrap book." As we have a large field to gather from, and the Agriculturist is usually preserved and bound, we design these pages to serve the purpose of the usual "scrap-book."

We also think it will be pleasant to every reader, after perusing the longer articles on farm matters, to turn over to a page like this, and enjoy a little amusement.

"A little humor, now and then,
Is relished by the best of men."

SWEET MOTHER.

THE LATE MRS. JUDSON.—The Home Journal gives a brief biographical sketch of "Fanny Forrester," from which we extract sufficient to explain the following exquisitely beautiful lines: "Before saying the few words by which we would recall the points of her varied life to our readers, let us give one of the drops of agony wrung from this heaven child while here on trial—a poem written for her mother's eye only, and certainly the most manifest first breath of a soul's utterance that we have ever seen in human language. It was sent to us some years ago by one of her friends, under a seal of privacy which we presume is removed by her death. She wrote it while at Maulmain, the missionary station in India, at which place she had been left by her dying husband, Dr. Judson, when he embarked on a nearly hopeless voyage for health. At the date of this poem, he had been four months dead, although it was ten days before the sad news was communicated to her."

The wild south-west monsoon has risen,
With broad grey wings of gloom,
While here, from out my dreary prison,
I look as from a tomb—Alas!
My heart another tomb.

Upon the low thatched roof, the rain
With ceaseless patter falls;
My choicest treasures bear its stains;
Mould gathers on the walls;—would Heaven
'Twere only on the walls!

Sweet mother, I am here alone,
In sorrow and in pain;
The sunshine from my heart has flown;
It feels the driving rain—Ah, me!
The chill, and mould, and rain.

Four laggard months have wheeled their round,
Since love upon it smiled,
And every thing on earth has frowned
On thy poor stricken child, sweet friend,
Thy weary, suffering child.

I'd watched my loved one night and day,
Scarce breathing when he slept,
And as my hopes were swept away,
I'd in his bosom wept—Oh, God!
How had I prayed and wept!

And when they bore him to the ship,
I saw the white sails spread,
I kissed his speechless quivering lip,

And left him on his bed—Alas!
It seemed a coffin bed,

When from my gentle sister's tomb,
Long since, in tears we came,
Thou saidst, "How desolate each room!"
Well, mine were just the same that day,—
The very, very same.

Then, mother, little Charley came,
Our beautiful, fair boy,
With my own father's cherished name:
But oh! he brought no joy—my child
Brought morning, and no joy,

His little grave I cannot see,
Though weary months have sped
Since pitying lips bent over me,
And whispered, "He is dead!"—Mother!
'Tis dreadful to be dead!

I do not mean for one like me—
So weary, worn and weak—
Death's shadowy paleness seems to be
E'en now upon my cheek—his seal,
On form, and brow, and cheek.

But for a bright-winged bird like him,
To hush his joyous song,
And prisoned in a coffin dim,
Join Death's pale phantom throng—my boy
To join that grizzly throng!

Oh, mother, I can scarcely bear
To think of this to-day!
It was so exquisitely fair,
That little form of clay—my heart
Still lingers by his clay.

And when for one loved far, far more,
Come thickly-gathering tears,
My star of faith is clouded o'er,
I sink beneath my fears, sweet friend,
My heavy weight of fears,

Oh, but to feel the fond arms twine
Around me once again!
It almost seems those lips of thine
Might kiss away the pain—might soothe
This dull, cold, heavy pain.

But, gentle mother, through life's storms
I may not lean on thee,
For helpless, cowering little forms
Cling trustingly to me—poor babes!
To have no guide but me.

With weary foot, and broken wing,
With bleeding heart and sore,
Thy dove looks backwards sorrowing,
But seeks the ark no more—thy breast
Seeks never, never more.

Sweet mother, for thy wanderer pray,
That loftier faith be given;
Her broken reeds all swept away,
That she may lean on Heaven—her heart
Grow strong in Christ and Heaven.

Once, when young Hope's fresh morning dew
Lay sparkling on my breast,
My bounding heart thought but to do,
To work at Heaven's behest—my pains
Come at the same behest!

All fearfully, all tearfully—
Alone and sorrowing,
My dim eye lifted to the sky,
Fast to the Cross I cling—Oh, Christ!
To thy dear Cross I cling.

Maulmain, Aug. 7, 1850.

SMALL faults indulged, are little thieves which let in greater.

MANY are great because their associates are small.

A MISTAKE IN THE WEIGHT.

ANDREW Wyman was like Lord Byron in one respect. He had a great horror of growing fat. What added to his apprehension on this score was the fact that his father, before he died, attained a degree of rotundity which would have enabled him to fill, respectably, the office of alderman.

Andrew stood five feet eight in his stockings, and weighed one hundred and forty-five pounds—a very respectable weight—within which he endeavored to keep himself by the free use of vinegar and other acids, which are reported to diminish any tendency to pinguity.

Andrew was in the habit of weighing himself once a fortnight, in order to make sure that he was not transgressing proper bounds.

He had been absent from home rather more than a week, and just stepped out of the cars into the depot, when his attention was arrested by an instrument for determining the weight.

Mechanically he placed himself on the platform, and adjusted the weight to one hundred and forty-five. To his surprise he found this not sufficient.

With an air of alarm he advanced it five pounds—still ineffectual. Imagine his consternation when the scales fell at one hundred and seventy-five!

"Good heavens!" said he to himself. "There can't be any mistake about it—I've gained thirty pounds within the last fortnight! I was afraid it would be so. It was so with my father before me. At this rate I shall go beyond him in a few weeks."

He entered the house with an air of settled melancholy upon his face, which excited the fears of his wife who had come forward to greet him after his absence.

"Why, Andrew—Mr. Wyman—what's the matter?" she asked.

"Matter enough!" he groaned. "I weigh one hundred and seventy-five pounds! Gained thirty pounds within a fortnight—or at the rate of fifteen per week. Suppose I should go on at this rate, or even ten pounds a week, in three months I shall be a perfect monster. I am the most unfortunate of men."

"I am sure you don't look any larger," said Mrs. Wyman.

"You don't find that your clothes have grown small for you?"

"Why, no."

"I'll tell you what, Mr. Wyman," said his wife, struck with a sudden idea, "are you sure you didn't have your valise in your hand, when you were weighed?"

Andrew's face brightened up.

"Wait a minute," said he.

He sped out of the house like an arrow—flew to the depot and renewed the experiment.

A moment after he entered the house again, his face glowing with joy.

"You've hit it, wife," he exclaimed. "I've weighed myself again, and only weigh one hundred and forty-three."

Mr. Wyman was so elated by the altered state of the case, that he at once gave his wife money enough to purchase a "love of a collar" that she had seen at Mr. Leask's the day before.

"It's an ill wind that blows nobody any good."

THE GREEK PEASANTRY.

THESE people remind me more and more every day of the North American Indian. In complexion they are lighter, but not unlike him. They have the same vaulting walk, the same erect and daring attitude. Perhaps the strongest part of the likeness is in dress. The moccasins of raw hide, made by perforating the edge with holes, and lacing it over the top of the foot with strings, is decidedly Indian. So is the coarse stuff legging, fitting the ankle and calf of the leg closely, and tied below the knee. The tunic, too, is only a white shaggy blanket, hanging down not quite to the knee, with holes for the arms, and sometimes with sleeves. The

Greek as well as the Indian wears a large knife stuck into his girdle, with the handle ostentatiously exposed. Their habitations are as similar as the difference of climate and building materials will permit. I speak here of the peasants of the interior. The dress of the females is a little different. They are barefooted. Their under-garment reaches to the ankles, and is usually ornamented with a gay border.

Over this is worn a tunic like that of a man, reaching about to the knee, then a sleeved jacket, reaching only to the waist. This and the tunic are often ornamented with needle work, mostly red in front, at the bottom, and down to the middle of the back. A kind of sack is often thrown across the neck before, hanging to the waist behind, laden with a bunch of often very large beads, and little metal plates of the size of the smallest coin, worn, I suppose, for ornament, and as aid to devotion. The men usually wear the Greek cap, which is always scarlet, high and cylindrical, surmounted with a tassel of blue, hanging from the center of the crown. As a substitute for this, I have noticed a common cotton shawl or large handkerchief wound about the head, not unlike the turban. The female peasantry often cover the hand in much the same way. In the large towns there is some variety in their head dress, and many of them wear a red or yellow shoe, sharp at the toe, and of bungling workmanship.

A CRAFTY ROGUE.—A countryman was passing along one of the streets of Baltimore with his wagon a few days since, when one of his wheels came off, and he discovered that a linchpin was gone. After searching for it some time, he offered the boys who congregated a shilling to find it. They then joined in the search, and in a few minutes one of them brought him what he supposed to be the pin. Having adjusted the wheel, he paid the shilling and started off, but had not gone more than half a block before a wheel on the other side came off, when he discovered that the young rascal had stolen the pin from one of the other wheels to obtain the reward.

RATHER COOL.—A friend, who has a large and sagacious dog, says the Detroit "Inquirer," told us yesterday that "Watch" saw the man leave in the morning the usual daily supply of ice at the door, which not being observed by the servant, lay melting away upon the area boards. Watch observed this wasting process with concern, until he could bear it no longer, when he commenced pushing the ice to a shaded place, and having been a short time absent, returned with a piece of old carpet, which he threw over it, as he had seen the servant do.

A GOOD ANSWER.—An exchange tells a story of a miserable drunken sot who staggered into a Sunday-school, and for a few minutes listened very attentively to the questions propounded to the scholars, but being anxious to show his knowledge of "scriptur," he stood up, leaning on the front of the pew with both hands. "Parson B—," said he, "ask me some of them hard ques'shuns." "Uncle Joseph," said the dominie, with a solemn face, in a drawing tone, "don't you know that you are in the bonds of sin and the depths of iniquity?" "Yes'ir, and in the gall of bitterness to. Ask me another ques'shun?"

QUITE UNANIMOUS.—A good deacon making an official visit to a dying neighbor, who was a very unpopular man, put the usual question—

"Are you willing to go, my friend?"

"Oh yes," said the sick man.

"I am glad of that," said the deacon, "for all the neighbors are willing."

Good resolutions are like fainting ladies—they want to be carried out.

THE FIRST QUAKER PUN.—Not long since a "Friend" who rejoiced in the name of Comfort, paid his devoirs to a young and attractive Quaker widow named Rachel H—. Either her griefs were too new, or her lover too old, or from some other cause, his offer was declined. Whereupon a Quaker friend remarked that was the first modern instance he had known where "Rachel refused to be comforted." The anecdote is remarkable as being the first Quaker pun on record.

A DO-NOTHING CONGRESS.—The Courier and Enquirer thus happily hits the character of the past Congress.

Congress makes it its business to do Nothing, and this business is already "thoroughly disposed of." What did it do yesterday? Nothing. The day before? Nothing. The day before that? Nothing. Last week? Nothing, except make Nothing of the Know-Nothings. Week before last? Nothing. Last month? Nothing, but buy land of Mexico where Nothing grows. Month before last? Nothing but turn the Missouri Compromise into Nothing. The month before that? Nothing whatever.

THE JACK-ASSES employed on some of the city railroads, endure the heat and fatigue of the Summer heroically. They keep in good order, and appear to be the best description of animals that can be employed in the business of drawing cars. As yet, they exhibit few of those unamiable traits for which public opinion gives them credit.

CAUGHT FOWL.—A bachelor friend of ours passing up the street yesterday, picked up a thimble. He stood for a moment meditating on the probable owner, when pressing it to his lips, he said: "Oh, that it was the fair lips of the wearer." Just as he had finished, a big, fat, ugly, black wench, looked out of an upper window and said: "Boss, jis please to frow dat fimble in de entry, I jis drap it!" Our friend fainted.

A THEORY EXPLODED.—The theory started some time since, that rain could be coaxed down from the clouds by fire, has been put to a hard test this season. There have been fires enough to make the "heavens weep" the biggest kind of tears, but all in vain. The theory thus far, may be regarded as an exploded one.—*Nashua Telegraph*.

THE HEIGHT OF MEANNESS.—The Knickerbocker tells of a man who stole a five dollar bill out in Indiana. His counsel tried to prove that the note was not worth five dollars, it being at a discount. The prosecutor said he knew the thief was the meanest man in the State, but he did not think he was so all-fired mean as not to be willing to steal Indiana money at par.

IN the list of births published in the Liverpool Courier of June 25th, is the following: "Lately, the wife of Jarvis Wilkingson, laborer, Wollaston, Notts, of her twenty-fifth child."

"WILL you rise now, my dear?" said a broker's wife to her sleepy husband, "the day broke long ago."

"I wonder," replied the somnolent financier, "if the endorsers were secured?"

AN APPROPRIATE SIGN.—An apothecary in Salem, (Mass.) has written over his door—"All kinds of *dying stuffs* for sale here."

INDOLENCE and indecision of mind, though not in themselves vices, frequently prepare the way to much exquisite misery.

IMMODEST words are in all cases indefensible.

PRESERVING the health by too strict a regimen, is a wearisome malady.

A WESTERN editor, noticing a Bloomer, said:—"She looked remarkably well as far as he could see."

THE loquacity of fools is a lecture to the wise.

THE most manifest sign of wisdom is continued cheerfulness; her estate is like that of things in the regions above the moon—always clear and serene.

REFINEMENT.—There is a young lady in Boston, who, when obliged to speak of a dog's tail, indicates it as "the extremity opposite his bark."

THERE is enough iron in the blood of 42 men to make 50 horse shoes, each weighing half a pound.

FOSSIL remains on the Ohio prove that it was once covered by the sea.

A FELLOW in Iowa jumped so high the other day, that he saw the dog-star wag his tail.

THE man who threw up the bargain, came very near having his hat smashed when it came down.

THE man who held on to a bargain, afterward let it go.

THE man who lost his confidence has not yet found it.

THE lady who took every body's eye must have quite a lot of them."

THE boy who crept on a pace, subsequently walked on a plank.

THE individual who snuffed a breeze, used "Macaboy."

THE fellow who run ashore, now runs a baker's cart.

STATE AGRICULTURAL SHOWS IN 1854.

Markets.

REMARKS.—Flour has fallen the past week 12½ to 50 cts. per bbl., dependent on the quality. Corn is 3 to 5 cts. per bushel lower, with a strong downward tendency since the copious rain. Pork, an advance of 25 to 37½ cts. per bbl. Beef and Lard have given way a trifle. Wool is still lower and dull of sale. It is calculated prices are from 25 to 30 per cent. less than last year at this time.

Cotton is ½ to ¼ of a cent per lb. lower, while Sugar is the same amount higher. Rice and Tobacco unchanged.

The Weather.—The thermometer ranged the whole of the past week from 85° to 95° in the shade, with a suffocating hot wind most of the time from the south. We have not suffered more from the heat any week this season, although the thermometer has not ranged so high by five degrees. On Saturday night, the 9th inst., it commenced raining about 9 o'clock, and continued to fall steadily for nearly fifteen hours, accompanied towards the last of it with a strong north-east gale. This has given us an abundance of water for the present. We are glad to learn the rain has been general for hundreds of miles around us. This morning, (Monday, 11th,) the thermometer was at 54° at sun rise; under a brilliant sun, the temperature is fast moderating. We are now assured of an abundance of fall pasture, a good crop of turnips, and some assistance to the late corn, potatoes and buckwheat.

PRODUCE MARKET.

Saturday, Sept. 9, 1854.

THE prices given in our reports from week to week, are the average wholesale prices obtained by producers, and not those at which produce is sold from the market. The variations in prices refer chiefly to the quality of the articles.

Nearly all kinds of vegetables in market command a high price, and are continually on the rise. Potatoes, however, have varied but little for a week or two past. Of turnips, there is a great scarcity. Melons, too, are not at all plenty, and bring a good price. Peaches and tomatoes have advanced 25¢@50¢ per basket. There is an abundance of apples in market, and very low. Large quantities are selling from \$1@2 per bbl. Butter continues about the same as last week.

VEGETABLES.—Potatoes, Mercers, \$3@3 75 ¢ bbl.; White, \$2 75@3 50; Sweet, Virginia, \$3 75; New-Jersey, \$4; Onions, red, \$1 75@2 ¢ bbl.; white, \$3; Turnips, Russia, \$2 75 ¢ bbl.; white, \$2 50; Beets, \$3 50 ¢ hundred bunches; Carrots, \$3; Parsnips, \$3 50; Tomatoes, 75¢@1 ¢ basket; Marrow Squashes, \$1 50 ¢ bbl.; Cabbage \$6@12 ¢ hundred; Watermelons, \$8@16 ¢ hundred; Nutmeg, \$2@3 ¢ bbl.; Pumpkins, \$4@10 ¢ hundred; Cucumbers, 75¢@1; Pickles, \$2@3 ¢ thousand.

FRUITS.—Apples, \$1@2 ¢ bbl.; Pears, common, same; Virgaloo & Bartlett, \$8@10 ¢ bbl.; Peaches, \$2@2 50 ¢ basket; Plums, Eggs, \$4 ¢ bushel; Butter, State, 21c. @23c. ¢ lb.; Western, 15c. @17c.; Eggs, 18c. ¢ doz.; Cheese, 10c. @11c. per lb.

NEW-YORK CATTLE MARKET.

Monday, Sept. 11, 1854.

THERE is only a moderate supply of cattle in the Washington market to-day, and consequently a little brisker sales and firmer prices. The butchers were inclined to hold off this morning, but the brokers gave them to understand that there were just so many cattle to select from, and so much to pay, and that they could buy them or not as they chose. As to the beef, it is rather spare, so that one could find no difficulty in procuring lean pieces. The cattle have evidently been dieting for some time past. We saw, however, some few droves in very good working order, which appeared to have had something more than bog-hay. Of these, one drove, 80 in number, was from Chester county, Pa., and belonged to Oulver, Hurd & Co. Another fine drove was from Fayette county, Kentucky, owned by M. H. Parker,

and fed by Thomas Shelby. They were Short-horns and in good condition. These, however, were not model beeves, but only an approximation.

Good beef is selling to-day at 8½¢@10¢. ½ lb. Best quality estimated 10½¢. Inferior, 7½¢@8½¢.

The following are about the highest and lowest prices.

Beeves,	7½¢@10¢.
Cows and calves,	\$30@50
Veals,	4½¢@6¢.
Sheep,	\$2@56 50
Lambs,	\$2 50@7

Mr. Chamberlin reports beeves, 6¢@9½¢; cows and calves, \$20@50; calves, 4¢@6½¢; sheep, \$2 50@56; lambs, \$1 75@54.

Mr. Browning reports beeves, 7½¢@9½¢; cows and calves, \$25@45; sheep, \$1 50@55 50; lambs, \$1 50@55; veals, 4½¢@6¢.

Mr. O'Brien reports beeves 8¢@10¢; cows and calves, \$25@45; veals, 5¢@6¢.

Washington Yards, Forty-fourth street.

A. M. ALLERTON, Proprietor.

RECEIVED DURING THE WEEK. IN MARKET TO-DAY.

Beeves,	2816	2800
Cows,		
Veal Calves,		
Sheep and Lambs,		

Of these there came by the Hudson River R. R., 500; Hudson River Boats, 200; Erie, 1,600; Harlem, 100. New-York State furnished 550; Ohio, 1,100; Indiana, 150; Illinois, 500; Pennsylvania, 400; Kentucky, 100.

125	2 75	10½
50 Stock Sheep	2 25	
125	2 00	
100	2 12½	

The market this week has been a little better than last, owing to the light supply offered the latter part of the week, and butchers have been more anxious to purchase. It is the opinion of many dealers that the rain we have had will have a tendency to keep a great many poor sheep out of market, and we may expect the market better. Good lambs are scarce, and good sheep are in demand, and good store ewes are selling well. The week closes with a light supply on hand and the prospect rather good. Mutton is selling by the carcass in Washington market from 4@8½¢. per lb., and lambs for 7@12½¢.

STATE OF NEW-YORK—SECRETARY'S OFFICE.
Albany, Aug. 10, 1854.—To the Sheriff of the County of New-York: Notice is hereby given that at the GENERAL ELECTION to be held in this State on the TUESDAY succeeding the first Monday of November next, the following OFFICERS are TO BE ELECTED, to wit:

A Governor, in the place of Horatio Seymour;
A Lieutenant Governor, in the place of Sanford E. Church;
A Canal Commissioner, in the place of Henry Fitzhugh;
and
An Inspector of State Prisons, in the place of Henry Storms;
All of whose terms of office will expire on the last day of December next.

A Representative in the Thirty-fourth Congress of the United States, for the Third Congressional District, composed of the 1st, 11th, 12th, 13th and 14th Wards in the City of New-York; for the Fourth District, composed of the 15th, 16th, 17th and 18th Wards of the City of New-York; for the Fifth District, composed of the 19th and 20th Wards in New-York; and the City of Williamsburgh in Kings County; for the Sixth District, composed of the 21st, 22nd and 23rd Wards in New-York; for the Seventh District, composed of the 24th, 25th and 26th Wards in New-York; and for the Eighth District, composed of the 27th, 28th and 29th Wards in New-York.

County Officers also to be selected for said County;
Sixteen Members of Assembly;
A Surrogate, in the place of Alexander W. Bradford;
A Recorder, in the place of Francis R. Tillou;
A City Judge, in the place of Welcome R. Beebe;
A Mayor, in the place of Jacob A. Westervelt;
A Register, in the place of Garrett Dyckman;
A Commissioner of Streets and Lamps, in the place of George G. Glazier, who was appointed to fill a vacancy caused by the resignation of Henry Arcularius;
A Police Justice for the Second District, in the place of Daniel W. Clark, who was appointed to fill a vacancy caused by the death of John McGrath;
Two Governors of the Alms House, in place of Gustavus A. Conover and William Pickney, appointed to fill vacancies;
A District Attorney, in the place of Lorenzo B. Shepard, who was appointed to fill a vacancy caused by the death of Nathaniel B. Blunt;
A Civil Justice and a Police Justice for the Seventh Judicial District, composed of the 11th, 12th, and 13th Wards;
A Police Justice for the Eighth Judicial District, composed of the 17th and 18th Wards. Yours respectfully,
E. W. LEAVENWORTH, Secretary of State.

SHERIFF'S OFFICE, NEW-YORK, Aug. 14, 1854.
The above is published pursuant to the notice of the Secretary of State and the requirements of the statute in such case made and provided.
JOHN ORSER, Sheriff.

All the public newspapers in the County will publish the above once in each week until the Election, and then hand in their bills for advertising the same, so that they may be laid before the Board of Supervisors and passed for payment. See Revised Statutes, volume 1, chapter 6, title 3, article 3, part 1, page 140. [53-60]
JOHN ORSER, Sheriff.

STRAWBERRY CULTURE.

A COMPLETE MANUAL FOR THE CULTIVATION OF THE Strawberry, Raspberry, Blackberry, Currant, Gooseberry and Grape, with selection of best varieties, by R. G. PARDEE, together with a valuable appendix containing the views of other experienced cultivators. This work covers the whole plan of the cultivation of the Strawberry, much more extensively than any work in this country; and the many thousands who cultivate this delicious fruit, will certainly each want a copy.

"Every process here recommended has been proved; the plans of others tried, and the result is here given." Price 50 cents, and will be sent free of postage. Just published, and for sale by
C. M. SAXTON,
Agricultural Book Publisher,
152 Fulton street, New-York.

53

FOR SALE—TWO SHEPHERD DOGS, A MALE AND FEMALE, of pure scotch blood, and three months old, can be had of ANDREW C. MURRAY, Factoryville, Staten Island, N. Y., at \$10 each. 53-55

FRUIT TREES FOR SALE

I HAVE NOW READY FOR SALE ONE OF THE MOST complete selections of fruit trees ever offered in this part of the country; and as thrifty and handsome trees as can be found in the United States apples, pears, peaches, plums, grapes, quinces, strawberries, &c. Subscribers to this paper will find in it the coming year full directions for managing fruit trees in best manner, with a complete list of the best varieties.
WM. DAY, Morristown, N.J.

LAWTON BLACKBERRY PLANTS.

FOR SALE THIRTY OFFSHOOTS WITH PLENTY OF roots, to be taken from plants which are in full bearing, with the true variety of Mammoth fruit, in packages of not less than half a dozen, or by the hundred.
Apply at the office of WM. LAWTON,
52 54 Wall-st, New-York.

NEW-ROCHELLE BLACKBERRIES—MY STOCK OF plants for the coming spring is already sold out. For the satisfaction of those who wish to know the price at which I sell them, I state that it is twenty-five dollars per hundred, and not twenty-five nor fifteen cents, as it has been incorrectly printed in the newspapers.
ISAAC ROOSEVELT,
Sept. 24, 1854.
52-56 Polham,
Westchester Co., N.Y.

WANTED IMMEDIATELY AT THE OFFICE OF THIS PAPER, A YOUNG MAN to attend to mailing papers, keeping books, taking care of the office, &c. This is a good opportunity for a smart, active young man to acquire a knowledge of business, providing he is ambitious, and not afraid of work. One who has been brought up in the country preferred. It is necessary that he be a good penman. For further particulars, address the Publishers of this paper in the hand writing of the applicant, and state age, residence, and former occupation; together with testimonials of faithfulness and good habits. To a person of proper qualifications this is an opening for permanent business and future advancement. No one is wanted who is not worth at least \$200 salary for the first year.

Application may be made personally at the office, between 2 and 4 o'clock P. M.

WHEELER AND WILSON MANUFACTURING COMPANY'S IMPROVED SEWING MACHINES, manufactured at Watertown, Conn. Office and Warerooms, at 343 Broadway, N. Y.

These Machines have been in successful operation, in the hands of manufacturers and families, for the past two years, and in every case have given universal satisfaction. The Proprietors are now prepared to offer them to the public, with that increased confidence in their merits which the extended testimony of their numerous customers has strengthened and confirmed.

These Machines are entirely different from any other, the principles on which they are made being *exclusively* our own.

Among the advantages of this Machine over any others are the following:

1. The simplicity of its construction, and the ease with which it can be kept in the most perfect order.
2. The perfect manner with which the operator is enabled to stitch and sew the various kinds of work, from the finest linen to the coarsest cloths.
3. It particularly excels in the rapidity with which work can be executed; in that respect it has no equal.

The little power required to propel them, enabling even those of the most delicate constitution to use them without injury to their health.

We are now manufacturing a larger sized Machine, more particularly adapted to the sewing of leather, canvass bags, and the heavier kinds of cloths.

An examination of our Machines is respectfully solicited at our Office, 343 Broadway. 37-55

A NEW FERTILIZER.

THE LODI MANUFACTURING COMPANY, (who have been manufacturing Poudrette for the last 14 years,) have, by a recently-discovered process, been enabled so completely to disinfect Night Soil, as to present to the Agricultural World, that long sought after and greatly to be desired article.

PURE NIGHT SOIL, DISINFECTED AND DRIED.

This article differs from Poudrette, and every other article of manure made from human excrement, from the fact that it contains no mixture of foreign substance whatever, (except 5 per cent of calcined gypsum, which is used to retain any fugitive ammonia.) the sulphuretted hydrogen which is the offensive gas escaping from Night Soil, is taken from it by a peculiar process. It is, also, entirely separated from rubbish not smaller than a pin's head, and so concentrated, that its bulk is decreased - nearly by half by manufacture, yet, at the same time, none of its virtues are allowed to escape. The Lodi Manufacturing Company have selected the Chinese words designating desiccated night soil as the name for this article, viz.:-

TA-FEU.

and offer it for sale under the following guarantees:

- 1st.—That it is free from unpleasant odor, and contains 95 per cent. of night soil concentrated, and 5 per cent. of calcined gypsum, and *nothing else*.

- 2d.—That it cannot be surpassed by any other manure in the world, either in fertilizing power or in cheapness.

- 3d.—That it is equal to Guano in the proportion of 4 pounds of Ta-feu to 3 pounds of Guano. That it is equal to any superphosphate of lime now in market *pound for pound* on any crop, and is one-third cheaper than Guano, and twice as cheap as superphosphate.

- 4th.—It contains every kind of good necessary to the growth of plants, and is perfectly soluble in water, making, therefore, a splendid *top-dresser* on grass and grain.

- It is perfectly dry, and can be bagged or barreled, and sent to any part of the United States. Price \$20 per ton, of 2,240 lbs., for any quantity over 10 tons; under that, \$25. No charge will be made for cartage or package.

Persons wishing to try it, can send us any amount, from \$3 upwards, and the exact number of pounds will be forwarded, with directions for use.

We recommend it strongly on cabbage plants, turnips, wheat, grain and grass, either sowed or harrowed in, or as a top-dressing, after the grain is up. On cabbages and turnips it has already been tried with astonishing results, having doubled the size of cabbage plants in a week.

From 300 to 500 lbs. per acre will be a first-rate dressing for grass in the fall, and for grain followed by grass; a table-spoonful is more than sufficient for a cabbage plant.

All communications must be addressed to the
LODI MANUFACTURING COMPANY,
49-54 74 Cortlandt St, New-York.

FANCY FOWLS—SHANGHAI FOWLS—DIRECT IMPORTATIONS—and Golden Pheasants for sale by
WM. DAY, Morristown, N. J. 52-58

Apply to JOHN F. CLEW,
Hyde Park, N. Y.;
Or, 90 Maiden Lane. 50-53

THE HORSE, THE HORSE, NOBLEST OF DOMESTIC ANIMALS.

AND THE ONE MOST FREQUENTLY ILL-TREATED, neglected, and abused. We have just published a book so valuable to every man who owns a Horse, that no one should willingly be without it. It is entitled,

THE MODERN HORSE DOCTOR.

and is from the pen of that celebrated English Veterinary Surgeon, Dr. GEO. H. DADD, well known for many years in this Country, as one of the most successful scientific and popular writers and lecturers in this branch of medical and surgical science. The book which he now offers to the public is the result of many years' study and practiced experience which few have had.

From the numerous and strong commendations, of distinguished men and the newspaper press, we select the following: Extracts from a letter from Hon. John H. Clifford, Ex-Governor of Mass.

NEW-BEDFORD, May 11, 1854.

Dr. Dadd,—Dear Sir:—I hope your new work on the noblest creature that man has ever been permitted to hold in subjection (the Horse) will meet with that success, which all your efforts in this direction so well deserve.

Your obedient servant, JOHN H. CLIFFORD.

From Hon. Marshall P. Wilder,

BOSTON, MAY 13, 1854.

Dr. Dadd,—My Dear Sir:—I am greatly obliged to you for the valuable treatise, the results of your own investigations, which you have recently issued, hoping that it may meet with the patronage of a discriminating community.

I remain yours with great regard, MARSHALL P. WILDER.

The "Modern Horse Doctor," by Dr. G. H. Dadd, is a manual of genuine science, and ought to be owned and studied on the score of humanity, as well as interest, by every man who owns a horse.—Boston Congregationalist.

Dr. Dadd has had great experience in the cure of sick horses, and explains the secret of his success in this vol.—N. Y. Tribune.

The author of this work is well known as a most skilful veterinary surgeon. His book is based on the soundest common sense, and as a hand-book for practical use, we know of nothing to compare with it.—Yankee Blade.

We know Dr. Dadd well, and are satisfied that he possesses most important qualifications for preparing such a book as this.—New-England Farmer.

Messrs. Jewett & Co. have just published a very valuable work by Mr. Dadd, a well-known veterinary surgeon, on the causes, nature and treatment of disease, and lameness in horses.—Farmer's Cabinet.

This is one of the most valuable treatises on the subject, ever published; and no owner of that noblest of the animal race, the horse, should be without it. Especially should it be in the hands of every hotel and livery-stable keeper. To many a man would it be worth hundreds of dollars every year.—Ind. Democrat, Concord.

By far the most learned and copious work on the horse and his diseases, we have ever seen.—N. Y. Evangelist.

One of the greatest and most commendable qualities of this work, is, it is practical and plain to the comprehension of those farmers and others for whom it is mainly designed. The course of treatment favors generally a more sanative and rational system of medication than that recommended in any previously existing works on farriery. No farmer or owner of a horse should be without this book. Stable keepers, stage proprietors and hackmen, we believe would derive profit by having at least one copy hung up in their stables for use and reference by their stable men.—Daily News, Philadelphia.

There is more common sense in this book than any of the kind we have ever seen, and farmers and owners of horses would find it a matter of economy to possess themselves of it. It will be of more service than the counsel of a score of ordinary doctors.—Albany Courier.

We deem this decidedly the best and most reliable work on the "Cause, Nature, and Treatment of Disease and Lameness in Horses," ever published.—Nantucket Inquirer.

What we have read of this book induces us to regard it as a very sensible and valuable work; and we learn that those much more competent to judge of its value, have given it their unqualified approval.—Ev. Traveler, Boston.

This book supplies a great desideratum which Skinner's admirable treatise on the Horse did not fill. Every man may be his own veterinary surgeon, and with much greater safety to this noble animal, than by trusting him to the treatment of the empirical itinerants who infest the country. It is well illustrated, and should be purchased by every man who owns a horse.—Ev. Mirror, N. Y.

This is a book that should be forthwith put into the hands of all who own or drive horses, whether for the dray or gig, for the plow, omnibus or road, for hard service or pleasure.—McMakin's Courier, Philadelphia.

A good, clearly-written book, which should be in the hands of every man who has a horse whose ill's his affection or his purse make it worth while to cure.—Bangor Mercury.

It is a valuable book to those who have the care of horses.—Hartford Herald.

This is a scientific, thorough and complete treatise upon the diseases to which one of the noblest of animals is subject, and the remedies which they severally require.—Troy Daily Budget.

He is not worthy to have a horse in his care, who will not use such a work to qualify himself for his duties to this animal.—Commonwealth, Boston.

Published by JOHN P. JEWETT & CO., Boston, JEWETT, PROCTOR & WORTHINGTON, Cleveland, Ohio. For sale by all Booksellers. 50-63.

DEVON CALVES.

THREE DEVON BULL CALVES—PEDIGREES WILL BE given—for sale by Edward G. Faile, West Farms, Westchester County, N. Y. 50-53

SHORT-HORN CATTLE AND SHEEP FOR SALE.

THE FOLLOWING SHORT-HORN AND OTHER STOCK, (all pure bred animals,) were sent out by Mr. Rotch, of Morris, Otsego Co., N. Y., to his farm, situated one mile from Albion, the county-seat of Edwards Co., Illinois, and are now for sale, as the farm is to be disposed of. For further particulars address Col. Hudson on the premises.

Cuba.—A red and white bull, calved April 17, 1853; got by Prophet, dam Coral, by Bertram 2d, (3144,) gd Conquest, by Washington, (1566,) ggd Pansey, by Blaize, (76,) ggd Primrose, by Charles, (127,) ggdgd, by Blyth Comet, (75,) ggdgdgd, by Prince, (321,) ggdgdgd, by Patriot, (486).

Prophet is a grandson of Yorkshirerian, (5700,) who was bred by Mr. Thomas Bates; his dam Phoenix, entered in herd book, Vol. V., page 798, as produce from Princess, &c.

Tea Rose.—A roan cow, calved May 2, 1848, got by Westchester, dam White Rose, by Splendid, (5297,) gd Yellow Rose, by Young Denton, (963,) ggd Arabella, by North Star, (460,) ggd Aurora, by Comet, (155,) ggdgd, by Henry, (301,) ggdgdgd, by Danby, (190).

Westchester was by Yorkshirerian, (5700,) by thus making Tea Rose a descendant on the bull's side, from the Kirkcaldy-ington herd.

Prairie Rose.—A red heifer calf from Tea Rose, by Prophet. See pedigree of Tea Rose.

Phasant.—A red heifer calved in the spring of 1852, by Prophet, dam Phlox, by Yorkshirerian, (5700,) gd Phoenix, by Hero, (4020,) ggd Princess, by Washington, (1566,) ggd Pansey, by Blaize, (76,) ggdgd Primrose, by Charles, (127,) ggdgdgd, by Blyth Comet, (75,) ggdgdgd, by Prince, (321,) ggdgdgd, by Patriot, (486).

The numbers refer to the English Herd-book, where the full pedigree of each animal may be found.

Besides the above, there are a few South-downs, and a few French merino sheep and lambs, all purely bred, Dorking fowls, &c. 50-54

FOURTEENTH ANNUAL CATTLE SHOW AND EXHIBITION

OF THE NEW-YORK STATE AGRICULTURAL SOCIETY, HELD IN CONNECTION WITH THE AMERICAN INSTITUTE AND NEW-YORK HORTICULTURAL SOCIETY, AT HAMILTON SQUARE, IN THE CITY OF NEW-YORK, OCTOBER 3d, 4th, 5th, AND 6th, 1854.

THE ANNUAL EXHIBITION OF THE SOCIETY WILL be held as above in the City of New-York, from Oct. 3d, to 6th, on which occasion upwards of Eight Thousand Dollars are offered as premiums to be contended for with Cattle, Horses, Sheep, Swine, Poultry, Dairy Products, Farm Implements and Machinery, domestic and other Manufactures, Flowers, Fruits and articles in all the mechanical departments, the full particulars of which will be found in the List of premiums published. A large portion of the Premiums are open to competition by persons out of the State.

It is believed that this combined Exhibition will be the most extensive ever held in this country, and will afford to Exhibitors, advantages never before offered in every department of the Exhibition, combining the entire industrial interest of the farmers, manufacturers, mechanics, horticulturists and artisans of our country.

Persons desirous of examining the list of Premiums and Regulations, or of entering stock, implements, or other articles for exhibition will please apply to P. P. Johnson, Secretary, State Agricultural Rooms, Albany, at the Rooms of the American Institute, 351 Broadway, or James, Beebe & Co., 356 Broadway, New-York, where the Premium List and Regulations will be furnished, and every desired information in relation to the exhibition given.

Stalls and fodder, for stock, and erections for the other articles will be provided in season so that all articles designed for Exhibition can be taken to the show grounds on their arrival in the City where they will be provided for and protected.

The following Railroads have agreed to transport all stock and articles on exhibition FREE, requiring the freight to be advanced on delivery and repaid on return of the articles with evidence of being exhibited &c.: Hudson River, New-York and Erie, New-York City and Buffalo, Ithaca and Owego, Canandaigua, and Elmira, New-York Central, Home and Watertown, New-York and Harlem, Long Island, Troy and Boston, and it is presumed all the Railroads leading into New-York, will afford the like facilities.

Application to transport articles, should be made in season to the nearest Station Agent.

B. P. JOHNSON, Sec. WM. KELLY, Pres. Aug., 1854. 49-53

AGRICULTURAL IMPLEMENTS.

AGRICULTURAL IMPLEMENTS.—THE SUBSCRIBER keeps constantly on hand, and offers for sale the following valuable implements:

Pan Mills of various kinds, for rice as well as wheat, rye, &c. Grain Drills, a machine which every large grain planter should possess. They are of the best patterns, embracing most valuable improvements.

Smut Machines, Pilkington's, the most approved for general use.

Hay and Cotton Presses—Bullock's progressive power-presses, combining improvements which make them by far the best in use.

Grain mills, corn and cob crushers, a very large assortment of the best and latest improved kinds.

Horse Powers of all kinds, guaranteed the best in the United States. These embrace—The Chain Power, of my own manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, and economy. They are universally approved wherever they have been tried. 2d. The Bogardus power, for one to four horses. These are compact, and wholly of iron, and adapted to all kinds of work. 3d. Eddy's Circular Wrought Iron Power, large cog-wheels, one to six horses, a new and favorite power. 4th. Trimble's Iron-Sweep Power, for one to four horses. 5th. Warren's Iron-Sweep Power, for one or two horses.

GRAIN MILLS, STEEL AND CAST IRON MILLS. At \$6 to \$25, and Burr-Stone at \$50 to \$250, for Horse or Steam Power.

TILE MACHINES.—FOR MAKING DRAINING TILES OF all descriptions and sizes.

WATER RAMS, SUCTION, FORCE, AND ENDLESS-chain Pumps; Leather, Gutta Percha, India Rubber Hose, Lead Pipe, &c.

CALIFORNIA IMPLEMENTS OF ALL KINDS, MADE EXPRESSLY FOR THE CALIFORNIA AND OREGON MARKETS.

DRAINING TILES OF ALL FORMS AND SIZES.

CLOVER AND TIMOTHY SEED HARVESTER.—A newly-patented machine, will harvest 10 or 12 acres per day with one horse.

For sale by NELSON WELLS & CO., 81 Dey street, between Washington and West.

May 13th, 1852. Nelson Wells. 1-52 S. H. WOOD.

SEEDS.—TIMOTHY; RED AND WHITE CLOVER; BLUE Grass; Orchard Grass; Bay Grass; Red Top; Sugar Corn; Peas; Beans; Turnip; Cabbage; Beet; Lettuce; Onions; Radish; Squash; Oatse Orange; Large Yellow Locust, and all other kinds of field and garden seeds. Also Rhubarb Roots; Asparagus Plants, &c. R. L. ALLEN, 191 Water street.

WILLARD FELT, NO. 191 PEARL STREET, (NEAR Maiden Lane.) Manufacturer of Blank Books, and Importer and Dealer in Paper and Stationery of every description. Particular attention paid to orders. 35-77

STOCK.

IMPROVED STOCK OF ALL KINDS.—HAVING HAD great experience in breeding and rearing fine stock for the past twenty years, I offer my services to my friends to procure it of the best and most reliable kinds. As much notice as convenient is at all times desirable previous to purchasing, as it takes time to make good selections. Early in August or September is the best time to purchase for the South.

Short Horn or Durham cattle, Devons, Herefords, Alderney or Jersey and Ayrshires. Long-wooled Sheep—the Cotswold Oxford, Leicester, Bakewell, and Lincoln. Mutton Sheep—the Southdown. Fine-wooled Sheep—such as the Saxon, Spanish, and French Merino.

The public should be on their guard in purchasing improved stock, as many animals are palmed off upon the unsuspecting and ignorant, which are spurious, &c. &c.

A. B. ALLEN, Nos. 189 and 191 Water.

Special Notices to Subscribers, Correspondents, &c.

Subscriptions can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September as a half yearly volume of 416 pages, with a complete index—begins on each of those dates.

Those wishing their papers changed from one office to another, should give the name, county, and State, of their old and new Post-office.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by Mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

The paper is stopped when the time for which it is paid expires. A notice or bill is usually sent in the last number.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then enclose them in the presence of the Post-master. Give the Post-office, and the County and State. *Write these very plainly.*

Economical Arrangement to furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished with Harper's Magazine, one year for	\$4 00
" Putnam's do do do do	4 00
" Knickerbocker do do do do	4 00
" Eclectic do do do do	6 00
" Littell's Living Age do do do do	6 50
" National Magazine do do do do	3 50
" Dickens's Household Words do do do do	3 50

PUBLISHERS' ANNOUNCEMENT!

Thirteenth Volume of

THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

THE AMERICAN AGRICULTURIST,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

N. B. The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume for the bound work.

COMPREHENSIVE IN ITS CHARACTER,

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers only that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon *its own merits*; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammelled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the editorial supervision of Mr. A. B. ALLEN,—its principal editor for the first ten years—and Mr. ORANGE JUDD, A.M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical agriculture, and, in addition to these, a number of other eminent agricultural and horticultural writers.

All the editors are men practically experienced in their profession, each of whom can handle the Plow as well as the Pen.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers, - - -	\$2.00 a year, \$2.00
" Clubs of 3 do. - - -	1.67 " 5.00
" do. 5 do. - - -	1.60 " 8.00
" do. 10 do. - - -	1.50 " 15.00
" do. 20 do. - - -	1.25 " 25.00

The money always to accompany the names for which the paper is ordered.

The Post-Master, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Post-Master, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, *Weekly Tribune*, or *Weekly Times*, or any other paper or periodical in this city, not costing to exceed two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if enclosed and mailed in the presence of the Post-Master.

Communications for the paper should be addressed to the Editors; subscriptions, advertisements, and all matters relating to the business department, should be addressed to the Publishers,

THE NATIONAL CATTLE SHOW AT SPRINGFIELD, OHIO.

A NOTICE of this important exhibition was advertised a few weeks ago in this paper. We think highly of this enterprise. Indeed, we like any thing which will bring out the farm stock of our country into friendly competition and rivalry for excellence. This is called a "National Show." That is to say, the enterprising farmers of Clark county, Ohio, made up their minds to have a cattle show open to the whole United States, and so advertised the public, and the officers of the United States Agricultural Society, whose head quarters are at Washington, have adopted the proposed Springfield exhibition as their own, with a view of adding to its renown, and making it more general than it could have been under local auspices. The amount to be expended in premiums is large—about six thousand dollars; the highest prizes to be \$300, and others in proportion; and all, we believe, bestowed on cattle of improved breeds.

This is a most liberal and patriotic proposition from a single county; which by the way, agriculturally, is one of the richest in Ohio, and should be liberally responded to by the stock breeders of other States. Ohio has now a large number of what *ought to be* among the best cattle in existence; for within the last two years the breeders have imported scores of Short-horns, which were selected from the best herds in Great Britain. So have the Kentuckians, who boast in no measured terms of possessing a country, the very "paradise of Short-horns." Our own State, New-York, has imported largely in various breeds of cattle, sheep and swine; and among them, animals of reputation and excellence, which have left no superiors behind them, even in England. The Springfield Exhibition now gives a great opportunity for the pick of all these cattle importations, (nothing but *neat* cattle are to be shown,) as well as native-bred stock, to meet in rivalry and comparison of their several merits.

The time appointed—25th October—is propitious. The local shows will all be over. The season will be cool and comfortable; and the cattle can be transported without risk of overheating or surfeit. The communications from other States to Springfield are all the way by railroad, and lake and river navigation by steamboat, each and all of them rapid and commodious. There can be no good reason then, why the show should not draw from a wide territory,

and embrace many exhibitors with a large aggregate of stock. It should, indeed, be a vast gathering of the substantial stock breeders and farmers of all the States, where they can interchange opinions, become acquainted with each other, and establish an intercourse which will be beneficial and lasting in its influences. The chief difficulty hitherto in the way of intercourse between the farmers of our different States, has been the want of a common ground and a common cause for meeting together, comparing notes, and ascertaining what they could learn of each other for mutual benefit. An event like this proposed at Springfield, opens the way for every man to throw away his prejudices against other States and other people, if he unfortunately have such, and open an intercourse which may become as agreeable as an enlightened and a generous heart could desire; and we trust that so favorable an opportunity will be embraced. Nor do we purpose to confine this gathering to stock breeders alone. Farmers in all variety of productions in the Northern and Middle States; the cotton and sugar planters of the South—every man who derives his support from the soil has, or should have, a direct interest in promoting the success of a display like this.

Although our farmers have recently shown an increased spirit in the improvement of their domestic stock, compared with the whole stock of the country, the infusion, as yet, of *really improved* animals, is scarcely perceptible. A few enterprising men have done nobly for the country, and we trust, in the result, for themselves, by introducing on their farms fine stock, either by importations direct from abroad, or the descendants of imported animals from other sections of the United States. This is always done at great expense of money and time, and is never properly appreciated by those who are likely to be the most benefitted—the immediate neighbors of those who take such pains. Indeed, if there be a thankless benefit in the whole agricultural world, it is that which is conferred by him who introduces good stock into a farming neighborhood hitherto without them. Usually he has been the butt of ridicule and derision to the ignorant boors around him. This, however, is getting better than it has been. Ignorance is getting cowed and skulking, while intelligence and liberality are taking the field in success and triumph.

The cattle shows throughout the country, this year, promise unequalled success in the excellence of their exhibitions. The spirit of our agricultural people has increased with the price of agricultural products. They can *afford* to be spirited and liberal; and we trust that the results of the multitude of gatherings to be held during the two coming months, will show a tri-

umph of skill and industry such as has never been witnessed in this country.

The proposed National Show at Springfield, Ohio, is an evidence of the growing liberality of agricultural men. It comes from the right quarter. The Western States are now, as they will always continue to be, the stock growing districts of the United States. They are full of broad, rich lands, inexhaustible in fertility, and possessed of every needful resource to support a dense and vigorous population. Herds and flocks, wide-stretching pastures and meadows, great fields of grain of every kind, must spread over its interminable prairies and openings, take the place of its vast wooded solitudes, and sweeten into life its sluggish swamps and marshes, and with a rapidity, too, more like dream than reality. Success, then, and the full measure of it, to the great Springfield Cattle Show! We advise all who can go, to attend it. If nothing unforeseen takes place, we intend to make a fraction of the number.

LETTER FROM SCOTLAND.

EDINBURGH, Scotland, Aug. 10, 1854.

SINCE I last wrote you, the annual Show of the Yorkshire Agricultural Society of England, and the Royal Highland Agricultural Society of Scotland have been held, the former at Ripon, England, and the latter at Berwick-upon-Tweed. I attended both, and meant to have given you a few particulars of their character ere this, but a pressure of engagements has prevented.

At the Yorkshire Show the display of horses, cattle, and pigs, was very good. Of the former, I noticed a number of very choice animals. The "Father of the Turf," "St. Bennett," and others, of the best blooded stock, attracted general admiration. These horses have taken prizes innumerable. The assortment of agricultural and draught horses was highly creditable. As at the great show of the Royal Society at Lincoln, of which I gave you some time since a brief account, the large dray horses took the lead. Many of them were as well developed as any nags that I remember to have ever put my eyes upon. Nearly two hundred horses were entered upon the competitors' list, of which seven were hunting stallions, twenty-two coach stallions, seven roadsters, and the balance agricultural stallions and mares, foals, &c., for hunting and posting. A premium of \$100 was given for best stallion for agricultural purposes, "to attend at Ripon on every market-day for the season of 1855, and to travel in the district." A good inducement to the breeding of good market horses—a variety much needed in the States, and towards the supply of which some measures should be taken. I really think that the improvement of the agricultural horses

of the States is of great importance. We have fast horses, and handsome horses, but for bone and sinew, and the necessary qualifications for service, our horses are in the main still deficient. The general use of oxen and mules, at the best ungain and awkward animals, proves this to be true.

The Short-horns were the dominant cattle at Ripon. Indeed, as I have before said, they take the precedence over all other species throughout England. There were forty-three full bred bulls on exhibition, varying in age from five months to five years. Of cows, heifers, and small calves, a good variety.

The Leicester, or long-wooled sheep, took the lead. There were thirty-three shearing rams, and all very good. A premium of \$100 was given for the best. The South-down sheep were well represented, though apparently counted a second-rate species. Several specimens of the Black-faced Scotch, or Highland sheep, attracted attention. Perhaps the feature of the show was the admirable display of pigs. Yorkshire has long maintained a high reputation for extraordinary swine, and the pens at Ripon were well calculated to sustain that reputation. One hundred and thirty pens of superb pigs would gain attention any where. Of the large and unprofitable breeds, there were a number of unusually promising specimens, but the small breeds were in the ascendant, and I noticed that they were mostly reared in Yorkshire. The mammoth porkers can never become popular. Breeders love the snug-built Suffolk, Berkshire, or even the Yorkshire, far more. A pig, like a pocket-book, should be small and fat, rather than great and gaunt. The little suckers, say eight weeks old, were being sold at from five to eight guineas each. Speculation prices certainly.

In the poultry line the display was most extensive, but by no means choice. The north of England supports fewer chicken fanciers than the south and west. There appeared 230 coops, Dorking and Black Spanish leading off, followed by Cochins, Games, and Pheasants, a few Bantams, very good, and good geese and ducks, with a number of pens of turkeys.

The agricultural implements, &c., &c., I need not allude to, nothing very novel being on the ground. I would give other details, of flax, wool, &c., but you will perhaps prefer to hear of the Highland Show.

Berwick-upon-Tweed is not purely a Scotch town, though claimed as such. Its extreme southern position, undoubtedly served to render the show less complete than it would have been had it been held at Edinburgh, Glasgow, or even at Aberdeen or Inverness.

A commodious plot of ground was enclosed on the green, east of the town, and on the banks of the cold German Ocean, and though it was but the 3d of August, the air wore a Novemberish chill. The whole town assumed a holiday appearance, and the crowds of lads and lasses, with laughing faces, and the many stout, hearty farmers and shepherds, wrapped in their Highland plaids, reminded me of the older days of Scotland. I found a great concourse of people in attendance. Not a few from the north of England, and as particular guests, the deputation from France, mentioned as being present at the Lincoln exhibition.

A very large enclosure had been made for the

articles on exhibition, but there were no sheds for the implements or cattle, as at Yorkshire or Lincoln; and had the weather proved unfair, there must have been much inconvenience experienced.

The agricultural implement department was allowed to be somewhat inferior to preceding years—about one-third of the space allotted to implements being unoccupied. The plows were numerous and creditable. Howard's plow gained the first premium at the trial, working admirably. This capital article is armed with an appendage, a little plow, whose duty it is to scarify the edge of the slice that is being turned over, which effectually prevents any vestige of beard appearing. The report speaks thus, and in every way commendatory of this plow.

There was no trial of reapers. A preparation of non-poisonous composition for the preservation of sheep and wool, seemed to attract the interest of the farmers.

The display of cattle was unusually good. Short-horns, Polled Breeds, Ayrshires and Highlanders, of beautiful appearance, filled the extensive pens. The black Polled, or hornless cattle, surpassed any variety of the kind that I have ever seen. Fat, compact, perfect-formed creatures they were. The Highland cows, with their rough hides and wide-spread horns, looked odd, but there is little beauty about them. Black and dun were the principal colors of the specimens.

One hundred and thirty-five horses were entered for the show. The large agricultural species again well represented. Indeed, some of the animals were equal to any that I had seen in England. The prices set upon them were extravagant.

The Leicester breed of sheep was represented by over 300 animals. The Cheviots, South-down and Black-face specimens were very good. Above fifty entries of swine were made. The breeders think that the cross between the sows of the large and boars of the small breed, produces the most valuable and economical pig. The poultry nothing extra. Cochin Chinas attracted much attention, being novel in the vicinity. The whole Show was as good as might have been expected at the season and place, and I was glad of an opportunity to attend. On the evening of the 2d, a public meeting was held in Berwick, to listen to an address from J. Hall Maxwell, Esq., the efficient Secretary of the Society, upon the agricultural statistics which the government are now trying to procure from the farmers of Scotland. I send you a copy of his remarks, and also a newspaper report of the fair, list of premiums, &c., and have to regret that my engagements are such as to prevent me the pleasure of giving you further details in this note.

I attended the famous St. James Show at Kelso-upon-Tweed, a few days since. Nothing transpired worthy of special record.

R. C. McCORMICK, Jr.

LOUISIANA STATE AGRICULTURAL SOCIETY.

We are glad to see that Louisiana is at last roused to the importance of forming an Agricultural Society. No other State can show a fifth of the rich river bottom-lands, that abound in Louisiana; and we believe that no State exports so large an amount of agricultu-

ral produce. An agricultural society, founded upon broad, enlightened principles, is, therefore, of great importance to this State. But in order to make it popular, and do the most good, it must resort to annual public exhibitions, the same as is done in New-York, and other States. The month of December would probably be the best time to do this; and New-Orleans would unquestionably be the best place for the exhibitions. We wish the Society unbounded success, and if we can in any way contribute to its welfare, we shall be glad to do so. A recent number of the New-Orleans Picayune contains the following notice of a meeting of gentlemen interested in this subject.

By the official report published in another part of our paper, it will be seen that on Wednesday evening last, a number of gentlemen, interested in agricultural pursuits, attended a preliminary meeting, held at the Mechanics' Institute, for the purpose of having read and taking action on the constitution of a new agricultural society, which it is proposed to form here, not only to advance the interests of agriculture in this State, but in the South generally. The principal mover in this important matter is Mr. J. B. Britton, originator, we believe, and now President of the Louisiana Rice Mills Company, and who, from his well-directed, intelligent and persevering efforts to introduce the cultivation of that valuable staple, rice, on an extensive plan, into this State, is deserving of all commendation. The confidence and esteem in which he is held by a wide circle of planters in this and the adjoining States, give him peculiar and enviable advantages in carrying to successful and active results the plan of a society of the kind above named.

We believe there is an agricultural society already incorporated in the State; but so far, if we are not mistaken, it has not achieved much. There are peculiar difficulties to be overcome in diffusing life and energy into such organizations in the South, most of them arising from the wide space separating the planters and farmers, the tediousness of communication and transportation, and a great deal we fear from a distaste for exertion that is not called on by motives of novelty or immediate personal interest. These disadvantages are well understood by the organizers of the new society, and as by its constitution the direction of affairs is thrown into the hands of a few persons, and these are not restricted to one or two old hackneyed methods, we may expect a number of effective means to be adopted, to arouse the agricultural interests of the State, to bring them into frequent and close communication, and obtain and diffuse information—practical, and therefore valuable.

The Society will, no doubt, receive a large accession to its numbers from this and the adjoining States, so soon as the fact of its organization becomes known. After the adoption of the constitution, on Wednesday evening, the Society proceeded to an election of officers, to serve until the first regular meeting, which will be held on the second Monday in January next, in this city. This resulted in the unanimous choice of the following gentlemen, most of whom were present and accepted the offices:

President—Valcour Aimé, planter, parish of St. James.

Vice-President—Judge P. A. Rost, planter, parish of St. Charles.

Curators—John C. Potts, planter, parish of Terrebonne; J. L. Riddell, Professor of Chemistry, University of Louisiana, New-Orleans; J. Blodget Britton, President of the Louisiana Rice Mills Company, New-Orleans.

Treasurer—Geo. W. Sizer, of the New-Orleans Agricultural Warehouse.

Corresponding Secretary—Edward C. Wharton, of Sherman & Wharton, printers, New-Orleans.

Recording Secretary—R. C. Kerr, of Bennett, Kerr & Co., New-Orleans.

This is certainly a strong Board of Directors, and no better names could be selected to merit the confidence of the agricultural community.

We are requested to say that persons desirous of obtaining further information on the subject, or wishing to obtain copies of the constitution, can apply to Mr. Sizer, at the agricultural warehouse on Poydras street, or to Mr. Wharton, at Sherman & Wharton's, No. 98 Camp street.

The next meeting of the new Society will take place at the Mechanics' Institute, on the evening of the first Monday of next month. We presume there will be a large attendance, by proxy or otherwise.

A PROFITABLE FARM.—The Farm of Bryan Jackson, near Wilmington, Delaware, consists of 220 acres. On this farm he employs three hands all the year, at \$132 per annum, each; two men extra for six months, at 12 per month, and day hands, whose wages amount to about \$50 a year; making in all for labor, a cost of \$590 a year. Mr. Jackson, in the *American Farmer*, says: "The sales of the farm the past year will not vary much from fifty-three hundred dollars."

STOCK RAISING IN TEXAS.

We concur entirely with the views of Mr. Dennett, the Texana editor of the *Indianola Bulletin*, upon the very great importance and value of the stock-raising interest of Western Texas. That this interest is not duly appreciated, great even as is the disposition of our people to invest capital in the business, we are well satisfied—and we have as little doubt that if properly cultivated, with railroad facilities to reach the northern markets, this source of wealth to Texas would be swelled to a magnitude little dreamed of by the most sanguine. But to the remarks of Mr. Dennett:

In the Northern markets, New-York and New-England beef is selling at from 8½ to 10½ cents—milk cows, \$25 to \$35, for ordinary cows, \$40 to \$70 for superior quality—working oxen from \$110 to \$180—farm horses for plowing, hauling, &c., from \$300 to \$425 per pair—sheep from \$6 to \$10.

We notice that the Cambridge market, Massachusetts, is supplied with beeves, cows and calves, horses, hogs, sheep, &c., brought by railroad from Maine, New-Hampshire, Vermont, Massachusetts, New-York, Pennsylvania, Kentucky, Ohio and Illinois.

These prices at the north are nothing unusual. We doubt if they will ever be lower. The increasing facilities for raising these animals do not correspond with the increasing demand.

What, then, should our State do in view of these facts? Every possible encouragement should be given to stock raising, and the rights and interests of stock raisers should be protected by law. No State in the Union can begin to compete with Texas in raising cattle, mules, horses, sheep and hogs. Railroads are stretching from our large cities to every nook and corner of the country. Texas and New-York, and Texas and California, will eventually be linked together by railroads, and our citizens should now be preparing extensively for these results of enterprises now on foot. If we can send beeves to California and New-York by railroad, we shall distance all competition in stock raising throughout the country. This State can now furnish pasturage for all the cattle, horses, and sheep in the United States and Europe. She can furnish the soil that can produce more and better cotton than all the Southern States now raise or have ever raised, or ever will raise. She can furnish the water power to manufacture a thousand times more cotton goods than all the New-England States now manufacture. She has a surface extensive enough to make forty such States as Massachusetts, and she has a soil forty times more fertile. With a suitable population, and a proper amount of capital judiciously invested, she could send forth yearly

productions that would yield returns as valuable as the gold of Ophir, in the far-famed ships of Solomon.—*Texas State Gazette*.

NEW FOOD FOR SHEEP.—Whilst I was at Geneva, I observed every one collecting carefully the fruit of the horse-chestnut, and on inquiry I learnt that the butchers and holders of grazing-stock bought it readily at a certain price per bushel. I inquired of my butcher, and he told me it was given to those sheep in particular that were fattening. The horse-chestnuts were well crushed; something in the way, so I understood, that apples are, previous to cider being made. They are crushed or cut up in a machine kept solely in Switzerland for that purpose; then about two pounds' weight is given to each sheep morning and evening. It must be portioned out to the sheep, as too much would disagree with them, being of a very heating nature. The butcher told me that it gave an excellent rich flavor to the meat. The Geneva mutton is noted for being as highly flavored as any in England or Wales.—*E. D., in Agricultural Gazette*.

CURE FOR RINGBONE.—I noticed in the *Cultivator* for May 15th, an inquiry for the cure of a ringbone in a colt, and answer, take high wines of cider brandy, add saltpetre as much as will dissolve, and wash the ringbone two or three times a day. One of my neighbors cured one of three or four years' standing, by the application a few times.—*Boston Cultivator*.

THE FIFTH CLAW OF THE DORKING FOWL.

THE Royal Agricultural Society's Prize Essay on Poultry teaches us that "The fowls of this breed have five toes on each foot, a peculiarity, if absent, denoting impurity of blood." This opinion should have been qualified, or might have been given as an opinion, rather than in the dogmatic form of an undoubted matter of fact. It would have been prudent to have cautioned purchasers from buying a so-called Dorking fowl with four toes; but as a matter of fact, the above statement is fallacious. Birds of the very purest strain sometimes produce chickens with four toes only, and this peculiarity occasionally occurs to a large extent; in the year 1852 my Dorking fowls, of whose purity, through many generations at least, there could not be the slightest doubt, produced one-fourth of their chickens with four toes—an incident which never occurred with the same fowls before, nor did it transpire in 1853, although no change in their management had taken place. In the same season large numbers of the chickens had five toes on one foot and four on the other; while several has six toes on one foot and four on the opposite. Neither will the converse hold good—the fifth toe being by no means a test of purity; for it will show itself through several generations by one cross of Dorking blood. In the same year in which my pure-bred Dorkings produced chickens defective in the number of their claws, some *half-bred* chickens presented this peculiarity in a redundant degree—the cockerels with the plumage, gait, and figure of their sire, a game fowl, possessed the fifth toe of extreme length and size; and nothing is more common than to perceive this supernumerary member on the feet of barn-door fowls, which contain in their veins as much variety of "blood" as is to be found in a Yankee. Yesterday, for instance, I saw in the yard of a farmer, a fowl which resembled a Spangled Hamburg in color, but it possessed a fifth toe, and was the offspring of a white game-cock with a grey spangled fowl not a Dorking, but probably possessing through some remote ancestor a faint trace of that breed.

Is not the fifth toe, after all, an "abnormal," and useless growth? Did it not spring up originally as a surplus appendage in some fowl of great size, and become stamped by hereditary descent through many generations, so as to be-

come almost a fixed type, through parties breeding from the *large* hen, because of her size, and not for the purpose of securing this supplementary member to the locomotive organ?

That it is a defect (if such a paradoxical term may be applied to a thing in excess,) is certain, for some high-bred chickens now before me, have great difficulty in walking, in consequence of these prolongations from each foot becoming entangled with each other; and suffer some pain from the abrasion which constant friction has produced upon each supernumerary toe.—*Poultry Chronicle*.

NEW PLAN OF BREAKING-IN HORSES.

A NEW system of breaking-in horses, by means of a very few lessons, and so as to preserve all their precious qualities, has come into use; and what is singular is that the author of it is a lady, named Isabelle. Having a great liking for horses, Madame Isabelle some years ago began studying the different systems employed in breaking-in horses, and came to the conclusion that they were all more or less defective. She then sought for a plan of her own, which should render the horse more tractable by developing its intelligence; and she succeeded in discovering one so perfect that the most restive horse is reduced to obedience in a very short time, and without the slightest ill-treatment. Her plan, as is almost always the case with things really useful, is very simple. She begins by making the horse carry his head high, and perpendicularly, whereby she prevents the weakness caused by the constant bending of the neck, gives free play to the muscles in the neck, and allows full action to be exercised over the mouth. Then she places on the horse a surcingle, surmounted by an iron rod 15 inches long, which is bent about four inches forward at the summit. On each side of the rod are placed four rings, destined to receive reins according to the height that may be desired. The horse soon gets accustomed to this check, and it exercises a great moral effect on him. He places his head in such a manner as not to suffer from the bit in the mouth, and thereby soon gets accustomed to being held in hand by his rider or driver. The surcingle also promptly accustoms him to adopt the best movements, and to advance when desired without offering any resistance. The breaker-in remains at the left of the horse, and is armed with a whip with a spur in it. After forming her system, Madame Isabelle went into Germany, and practised it with marked success on horses belonging to Prince de Lichtenstein, at Vienna. From Vienna she went to Russia, and there stopped two years. In the course of that time she rendered completely docile all the most restive horses of the old cavalry regiment at St. Petersburg, as well as those of the Emperor Nicholas. Recently she returned to France, and having explained her plan and stated its results to the Minister of War, she was, by the special direction of the Emperor, who was consulted, authorized to practise it on a number of young horses of the regiment of Guides, and with an equal number of recruits who had recently joined the regiment. The lessons were given under her direction at the riding-school of the Ecole Impériale d'Application d'Etat Major. After the fifteenth lesson the horses manœuvred with the tranquility and precision of old troop horses. A few days ago, Colonel Fleury, who commands the regiment, manœuvred the horses and recruits, and every one of the usual cavalry movements was admirably executed.

TALL OATS.—Mr. J. Alphin, of Sublimity, Marion county, Oregon, has left at the office of the Statesman, a head of oats, grown on the farm of D. S. Staton, which contained 602 perfect grains. The head is but little, if any, better than an average one. Mr. A. also exhibited a large head of wheat, containing seven grains in each section, perfect, and of remarkable size.—*California Farmer*.

AN INQUISITION FOR STOLEN FRUIT.

In Mr. Gunning's Sketcher, a new English book, he tells a story of Dr. Ogden, the Professor of Geology:

The Doctor had taken a great fancy to a lad who had been in his service three or four years; he was much pleased with his management of a garden which was attached to his house, and of which he was particularly fond. A cherry tree, which had been planted some time, and which should have produced very choice fruit, had constantly failed. To the Doctor's great delight it at last showed signs of bearing, and about a dozen cherries after a while began to assume a tempting appearance. Returning one day from his ride, he missed some of his cherries, and accused the boy of having taken them. "I have not touched them," replied the boy, "as true as God's in heaven," (a very common mode of assertion among inferior people at that time.) "That's a good lad! sit thee down, and I'll give thee a glass of wine for thou would'st not tell me a lie! Going to his closet, he put a pretty strong dose of antimonial wine into a glass, which the boy drank off, and was preparing to leave the room, but his master kept him in conversation. At length the boy was making a *hasty retreat*, saying he did not feel well. "Do not quit the room," said the Doctor, "sit thee down; thou wilt soon be better;" and ringing the bell, he ordered a jug of warm water, which he administered very freely, at the same time providing a basin. The cherries soon made their appearance, to the great consternation of the lad. "Where's the God in heaven?" said the Doctor. "Thou miscreant! get thee out of my house!" He quitted it the same day, but not until the Doctor had showed him his will, in which he had left him £200.

GURNEYISM AS APPLIED TO GRAZING.—About two years since the spirited owners of the Pinchbeck Flax Rettery, near Spalding, Lincolnshire, requiring additional space upon which to dry their flax, applied to the proprietor of an adjoining arable field of 20 acres for its use. Being a thoughtful farmer, somewhat of the old school, and a clever man of business, he did not forget what "spreading flax" did for land forty years ago; and desiring to retain his land, as also to accommodate his neighbors, he at length made a proposal which has proved advantageous to both. The land was let upon lease for 21 years, divided into four equal parts, and laid down to grass—the proprietor to retain the use of the grass. One of these divisions is at all times, and in alternate courses, to be cleared for the stock; and no flax is to remain on the ground to dry longer than 14 days, so that the drying, clearing, and stocking shall proceed as uniformly as possible. In this way it frequently follows that more than one part is at liberty to receive the stock; but more generally three parts are under the flax in its various stages, and only one stocked. The great fact, however, is this: that, notwithstanding tramways and trampling, laying out and gathering in, &c., this field of 20 acres has well and satisfactorily grazed during the summer no less than 267 large, long-wooled, hogget sheep. Surely this is great proof of the value of the system; it ought to be more extensively tried, and proper results given, both experimentally and scientifically.

A SINGULAR DANGER OF CATTLE.—Our attention was yesterday called to one of the most remarkable dangers attending the pasturage of cattle, in the western country especially, of which we have ever heard. The facts which we will state show the great necessity there is at all times for farmers and others to be most careful and prudent in providing *clean* pasturage for their animals, and for resorting to all precautions for detecting in and excluding from fodder and provender generally, which is to be fed out to or come within the reach of stock,

every possible foreign substance. The particular circumstance to which we now refer, as proving this, was the exhibition to us yesterday by John P. Wild, an entomologist of this city, of two large indigestible balls found in the stomach of a diseased cow. The balls are specimens of thirteen such taken from the stomachs of two different cows that died near Louisville, Ky.—four balls from one and nine from the other cow. The largest of these balls is almost perfectly globular, and nearly the size of the mapped globe ordinarily used in the schools, being about 16 to 20 inches in circumference and nine or ten in diameter. The smallest is more of an egg form, and is, in diameter about four inches one way and three the other.

These balls appear to be entirely composed of hogs' bristles or hair, and were taken into the stomach with pasturage from a grass lot where bristles from the hogs killed in a pork-packing establishment were spread regularly for drying. It was not until after one of the cows had died from this cause, that the circumstance of their swallowing the bristles was known, or rather that the lodgment in the stomach, and gradual accumulation of so indigestible a substance was dreamed of. The compact globular form which the bristles assumed is attributed to the constantly revolving movement of the cow's food, during the process of what is commonly called "chewing the cud." In the hog-packing regions of the West, or in the vicinity of curled hair manufactories, where the hair of the hog, &c., is steamed and curled tightly into that form which fits it for cushions and mattresses, it will be seen that there may always be danger to animals from this cause, unless it be duly provided against.

ARTIFICIAL CHICKEN HATCHING.

We notice in the English papers, that quite an improvement on the old plan of chicken hatching has been made by a Mr. CARLO MINASI, requiring much less attention to the machine during the process of incubation than formerly. This was the great objection to all previously constructed hatching machines. It may now go three days without attention; formerly it could be scarcely left three hours.

This new incubator is a very simple contrivance, and can, consequently, be constructed at about one-fourth of the expense formerly required. The practical results are equally satisfactory, for he states that the average number of birds produced is eighty out of every one hundred eggs. The necessary heat is obtained from a naphtha lamp, without a wick, which is so arranged that it may be left to itself for two or three days together, and yet the process of hatching goes on with due regularity and certainty. The eggs are placed on a series of tubes, through which a stream of hot water is, by means of the naphtha lamp, kept constantly flowing; and, when the chicken comes out of the shell, it is placed beneath the same tubes, which now perform the second duty of the artificial parent. After being kept there the proper time, it is removed to a compartment more suited to its increasing strength, and is ultimately placed in a pen in the open air.

Mr. Carlo Minasi has not confined his operations to mere barn-door fowls, but has taken a flight into the regions of what may be termed scientific natural history, and displays, with satisfaction, as a proof of his skill, a very healthy specimen of the barnacle goose, which is to be an addition to the Ornithological Society's collection in the Regent's Park. The enthusiastic pursuit of his art does not allow Mr. Carlo Minasi to stop here, for his success has excited his ambition even to the incubation of the eggs of an ostrich, which he feels quite confident he could accomplish. Should it prove so, it would be advisable, before the time arrived to welcome the little long-legged stranger, to remind the establishment of the old maxim—and

the occasion on which it was used—of "Every one for himself," as the donkey said when he danced among the chickens—to prevent serious doings in that miniature poultry yard.

The eggs are half embedded in sand, which is placed *over* the tubes, charged with hot water, so that it is an under heat which performs the hatching. Mr. Minasi informed us, that from being thus embedded, *the same heat only* as that of the hen is required; whereas, in incubators in which the eggs are not so embedded, the heat is obliged to be greater, from which the chickens suffer in strength.

The naphtha consumed during the three weeks of incubation is about a gallon, which may be purchased for 3s. 6d.—*Poultry Chronicle*.

WHEAT IN CALIFORNIA.—The Union states that since they commenced threshing on the ranch of Messrs. Hutchinson and Green, on Putha Creek, Yolo County, the Superintendent, Captain Clary, measured ten acres, forty rods square, hauled the wheat to the machine, threshed and weighed it. The weight was forty thousand and four pounds, which, at sixty pounds to the bushel, give sixty-six and two-thirds bushels of wheat to the acre. This is a larger yield per acre than we have ever known taken off the same quantity of land.

HON. S. P. BENSON, in a letter to a friend, says:—That on a very rough approximation, the amount invested in agriculture in the United States, does not fall short of \$5,000,000,000, (five billions,) and that the capital in manufactures and commerce together, cannot possibly be more than one-fifth of that amount. In a new volume of the census, I intend an examination of this matter.

AMERICAN BRAHMAS.

We would respectfully inform our English friends and readers of the "Farmer," that the idea prevalent to some extent in England, that Brahma fowls existed there previous to being sent by Dr. Bennett, is a mistake. Mrs. Hosier Williams, of Eaton Mascott, near Shrewsbury, received direct from Dr. B. the first pair introduced into England, and her acknowledgment of the same shows that, at least, she had never heard of that breed, nor had she ever seen any like them before, although an extensive fowl-fancier, and acquainted with all the breeds favorably known in England.

The origin of these fowls can never be traced farther than has already been developed, true or fabulous, and at this late day it is quite useless to attempt to arrive at any new facts pertaining thereto. We profess to know about as much in regard to their origin as any one, having heard the views and statements of all parties from the beginning to the present day. We, therefore, are prepared to make the following statements, and we challenge any man to prove us in error.

1st. That no Brahma Pootra fowls have ever been imported into the U. S., or any other country from China or Asia, since the alleged importation of three pairs to the city of New-York in 1850, from one of which it is alleged all the Brahmata have originated, now in this country, or in England.

2d. That no such fowls are known to exist in China, or Asia, at the present time.

When we say *Brahma* fowls, we do not mean *grey Shanghaes*, as it is quite probable that *grey* fowls may have been imported from China; and we refer to fowls with cream-white bodies, dark wing and tail tips, and neck hackles of the same hue.

It is of no consequence now how they *originated*, as a knowledge of that matter cannot change them in the least; but it is certain that a *pure* Brahma fowl was never seen in England till sent there from the United States.—*North-ern Farmer*.

CATTLE AND SHEEP MARKET OF CALIFORNIA.

THERE are now in the market about eight thousand head of Spanish cattle, and sales have previously been made of sixteen thousand head of the same cattle, at an average of \$40 for old steers. Of American cattle there are now in market about four thousand head, consisting of working oxen and cows—mostly working oxen. There have been no sales made of American stock of any magnitude, except in cows. They have sold both in Los Angeles county and here, for \$100 to \$150 per head. Oxen are held at \$150 to \$200 per yoke. The demand for them is poor and few sales made. We are in hopes that as soon as the warm weather is over, there will be more demand for American beef, and that will give us better sales of our oxen that are fat.

As for Sheep, there have been in market one hundred and thirty thousand Spanish Sheep from Sonora and New-Mexico, and of those left in market the amount will not exceed seven thousand at this time. Our friend Aubrey, of Santa Fe, closed out last week the last of thirty-eight thousand, in fifty-two days' sales at \$4 to \$9 per head. The weight of a Spanish sheep is about thirty pounds dressed.

The number of American sheep now in market is but eight thousand. They belong to W. W. Hollister and Brother, of Licking county, Ohio, and Flint & Biggsby, of Maine. They are holding them at \$15 per head. No sales have been made of American sheep, except fifty ewes and lambs, by the Hollisters, at Los Angeles, for ranch purposes, at \$1,000.

The number of sheep killed in San Francisco is three hundred and thirty per day; the number of cattle one hundred and twenty per day. The number killed in the State is about two hundred and fifty cattle and one thousand sheep per day.

SPLENDID GRAIN.—Mr. James Morrison, four miles south of Oakland, has sent us a sheaf of the finest wheat we have ever seen—about five feet high, heads ten inches long, and the fullest, cleanest, and best filled grain that has been exhibited yet. Mr. M. approves and practises deep plowing, and sub-soil plowing.—*California Farmer.*

GREAT INCREASE OF DOMESTIC FOWLS.—We saw upon the ranch of Jessie Beard, Esq., the best proof of the success of this branch of domestic industry. Mr. Beard commenced in January last, upon his fine ranch, with ninety hens. Now in less than seven months the stock has increased to over fifteen hundred hens and chickens on hand, besides about three hundred that have been sold. All this has resulted in doing things well. Personally and particularly has the interest been guarded, and there has been no lack of that proper care which is always needed to insure success.—*Id.*

AN ARAB STEED.

THERE was one of our rides which I never call to mind without a leap of the heart. The noble red stallion which I usually mounted had not forgotten the plains of Dar-Fur, where he was bred, and whenever we came upon the boundless level extending southward from the town, his wild blood was aroused. He pricked up his ears, neighed as grandly as the war-horse of Job, champed furiously against the restraining bit, and ever and anon cast a glance of his large brilliant eye backward at me, half in wonder, half in scorn, that I did not feel the same desire. The truth is, I was tingling from head to foot with equal excitement, but Dr. Reitz was a thorough Englishman in his passion for trotting, and was vexed whenever I rode at any other pace. Once, however, the sky was so blue, the morning air so cool and fresh, and the blood so lively in my veins, that I answered the

fierce questioning of Sultan's eye with an involuntary shout, pressed my knees against his sides and gave him the rein. O Mercury, what a rush followed! We cut the air like the whizzing shaft from a Saracen crossbow; Sultan stretched out until his powerful neck was almost on a level with his back, and the glorious rhythm of his hoofs was accompanied by so little sense of effort, that it seemed but the throbbing of his heart, keeping time with my own. His course was as straight as a sun-beam, swerving not a hair's-breadth to the right or left, but forward, forward into the freedom of the Desert. Neck and neck with him careered the Consul's milk-white stallion, and I was so lost in the divine excitement of our speed, that an hour had passed before I was cool enough to notice where we were going. The Consul finally called out to me to stop, and I complied, sharing the savage resistance of Sultan, who neighed and plunged with greater ardor than at the start. The minarets of Khartoum had long since disappeared; we were in the center of a desolate, sandy plain, broken here and there by clumps of stunted mimosa—a dreary landscape, but glorified by the sunshine and the delicious air. We rode several miles on the return track before we met the pursuing attendants, who had urged their dromedaries into a gallop, and were sailing after us like a flock of ostriches.—*Bayard Taylor.*

REMEDY FOR THE BITE OF A MAD DOG.—We have already published the following remedy for the bite of a mad dog. As some excitement exists in relation to the alleged prevalence of hydrophobia, and exaggerated reports are circulated of persons having been bitten, we again give it a place in our columns as worthy of trial:

"A Saxon forester, named Gastelf, now of the venerable age of 82, unwilling to take to the grave with him a secret of such import, has made public in the *Leipsic Journal*, the means which he had used for fifty years, and where-with he affirms, he has rescued many human beings and cattle from the fearful death of hydrophobia. Take immediately, warm vinegar or tepid water, wash the wound clean therewith, and then dry it; pour then a few drops of muriatic acid, because mineral acids destroy the poison of the saliva, by which means the evil effect of the latter is neutralized."

It would be better, after making these applications, to heal the wound under a poultice. There are some physicians who contend that hydrophobia is in reality lock-jaw aggravated by the imagination and fear of the patient.

The latter disease exhibits symptoms of a similar character, and is often produced when a wound inflicted with a blunt instrument is healed too quickly. Suppuration must precede granulation, and if the outside of the wound is healed, the inner portion, particularly where the wound is deep, and a nerve has been lacerated, cannot heal, and lock-jaw often supervenes. In all cases when a wound is inflicted by a blunt instrument—whether by a nail, the tine of a pitchfork, or the tooth of an animal—it should be laid open until it assumes a healthy appearance.—*Boston Journal.*

INSECTS.—The Legislature of the State of New-York at its last winter session, placed 1000 dollars in the hands of the State Agricultural Society, to make investigations respecting the insects that are hurtful to vegetation. The work was placed in the hands of Dr. Asa Fitch, of Washington county. It is understood that, this season, his investigations have been confined to the insects that injure the fruit tree. A memorial is soon to be expected from him on that subject, which will be one of great interest.

MICE ON THE RHINE.—It is said that the German farmers of the lower Rhine have been so troubled with mice, that a deputation from Alsatia went to Strasbourg and invoked the aid of

the prefect. At his recommendation a large number of new mouse-traps was procured, and on a space of three acres in thirty-six days there were caught 15,371 of the little creatures, an average of near 450 per day. An enterprising Yankee might turn an honest penny by importing cats into Germany.

For the American Agriculturist.

DOMESTIC RECIPES.

I HAVE begged a copy of a recipe for DROP CAKES, for the readers of your valuable paper. I think no one who tries it can fail to consider it most excellent. They should be baked in cups or saucers, in a quick oven, and eaten as soon as done:

4 eggs, 1 cup of sugar, 1 cup of butter, 2 quarts of flour, 1 quart of milk, 4 tea-spoons of cream-tartar, 2 tea-spoons of soda, a little salt.

I should like also to recommend to the ladies, SWEET-MEAT PICKLES. They are easily prepared, and make a fine relish for the tea-table, preferable, on many accounts, to ordinary preserves.

To PICKLE QUINCES.—To 7 lbs. of quinces, 4 lbs. of sugar, 1 quart of vinegar, 1 oz. of cinnamon, $\frac{1}{2}$ oz. of cloves.

Scald the vinegar with the spice, and pour on the quinces, having first cut them in thick slices, and boiled in clear water until tender.

Pears and plums may be done in the same way, except the fruit should be left whole.

I have also, to me, a new RECIPE FOR PICKLING GREEN TOMATOES, which "they say" is unusually nice.

1 gal. tomatoes chopped fine, 4 green peppers, 4 onions chopped, a handful of salt sprinkled over them. Let them stand 6 hours—then drain off the juice—add 1 table-spoonful of ground pepper, 1 of all-spice, 1 of cloves, 3 tea-spoonfuls made mustard, $\frac{1}{2}$ pint grated horse radish, $\frac{1}{2}$ pint mustard seed, 3 pints cider vinegar.

Cucumbers are good put up in the same way.

Cucumbers make very good mangoes.

If boiling water is poured over cucumbers when gathered for pickles, and they remain in it till it is cold, they will not soften. They may then be thrown into cold vinegar till enough are collected to pickle with spices.

ANNE HOPE.

RECIPES.

TOMATO PIE.—After you have lined your plate with paste, spread thereon a layer of sliced green tomatoes, add a tea-cupful of molasses, two small table-spoonfuls of flour, a little salt and nutmegs. Cover with paste, and bake slowly, and it will make an excellent pie.

CREAM CAKE.—One cup sour cream, one of sugar, two of flour, and two eggs, and 2 tea-spoon-ful salaratus.

CUP-CAKE.—One cup of butter, two of sugar, three of flour, four eggs, one cup sour milk, one tea-spoonful salaratus. Bake in small dishes.

TO KEEP WORMS FROM DRIED FRUIT.—Place your fruit in a steamer, over a pot of boiling water covered tightly. When thoroughly heated, tie them up immediately in a clean cotton or linen bag, and hang them up. This method is preferable to heating in an oven, as that is apt to render them hard, even if you are so fortunate as to not burn them.

LIBBIE.

Horticultural Department.

FIELD FLOWERS.

BY PARK BENJAMIN.

HERE are daisies, buttercups,
Upon which the wild bee sups,
And from which he steals
Honey for his winter store—
Much he takes and comes for more—
What delicious meals!

They are undervalued flowers,
Never grown in garden bowers,
Seldom culled for wreaths;
But each little blossom yields
Sunny pleasure to the fields
Where its fragrance breathes.

They are like those humble hearts
Never playing mighty parts
On the world's wide stage,
But, with feelings true and warm,
All life's duties they perform,
And its cares assuage.

Blooming in the summer air
Here, and there, and every where,
Careless of renown,
Quite unnoted in their birth,
As when in their native earth
They lie meekly down.

Naught below is lovelier seen,
Than amid the common green
Their contrasted light,
White and golden, scattered round,
Small day stars, as frequent found
As the stars of night.

Worthy they, these tender things,
Of the song the poet sings
In his happy hours;
They are his peculiar toys,
Fresh delights and living joys—
Nature's simplest flowers!

SHOW OF THE BROOKLYN HORTICULTURAL SOCIETY.

THE Fall Exhibition of this Society commenced yesterday, (Tuesday, 19th,) and continues three days. As our paper goes to press on Monday evening, we can only say that there is a prospect of a fine show, one which, like that held in May, will add to the credit of this vigorous and growing Society. No one in this vicinity at all interested in the objects of the Society, will fail to visit the show to-day or to-morrow.

NEW-YORK HORTICULTURAL SOCIETY.

THIS Society met at their rooms 600 Broadway, on Monday evening, the 11th September. John Groshon in the chair, and P. B. Mead Secretary.

The Committee of Conference with the State Agricultural Society reported that the members of this Society would be entitled to all the benefits of membership in the State Society.

On motion of Mr. Mead, Messrs. Hogg, Mead, and Bridgman were appointed a Committee to canvass the field of their operations, and solicit plants to make a creditable display in the Fair of the State Agricultural Society. It was also resolved that members of the Society who have

premiums standing in their favor, are at liberty to transfer the necessary amount to the payment of their yearly dues.

CONVENTION OF THE AMERICAN POMOLOGICAL SOCIETY.

WE attended the sessions of this body in Boston, on the 13th and 14th insts. Delegates and members were present from several States and Territories, and the meetings were well attended and interesting.

The Hon. MARSHALL P. WILDER, of Massachusetts, was unanimously reelected President, and most of the Vice Presidents, and other officers, chosen at the last meeting, in Philadelphia, two years ago, were also reelected. The address of the President was of a lively character, and concluded with a hearty welcome of the Society to the hospitality and attentions of the Massachusetts Horticultural Society.

That Society had prepared an exhibition at the same time, which was thought to surpass all their previous Shows, and it afforded no little gratification to the delegates to inspect the extensive exhibition of fruits, from the grounds of the best growers in the vicinity.

The Pomological Society devoted all of Wednesday and the forenoon of Thursday, to a discussion on *Pears*. In the first place, they rejected from the list a large number—probably some fifty or sixty kinds, but the names of most of them have never come under the notice of ordinary cultivators. Three votes in favor of any pear prevented its being proscribed.

The next step was to review the lists, and see if any pear could be advanced by a two-thirds vote of the Convention to the highest grade, as worthy of general cultivation. The Lawrence pear was thus unanimously advanced. Mr. S. WALKER considered it the greatest acquisition, and taken all in all, the best pear for general cultivation. Others confirmed the opinion. It is always fair, not quite so large as well-grown Virgalieus, and ripens in December and January. It is an American pear. Manning's Elizabeth was also advanced to the same honor. Beurre Superfine and the Howell Pear were unanimously placed on the list of those which promise well. Of the Beurre Superfine, Mr. Wilder thinks it a pear of great excellence, ripens in November and December, has all the good qualities of the Brown Beurre, and is larger and fairer. Mr. Hovey has fruited it three years, and thinks it very fine. Mr. Saul has fruited it six years, and thinks highly of it. Mr. Barry and Mr. Prince decidedly approved of it.

Doyenne Boussock and Steven's Genessee, had warm advocates, while others were disposed to think less of them, as not of sufficient high rank in flavor and quality. Mr. Hovey thinks the former one of the best market pears we have, and a gentleman present from Belgium, said it was the great market pear of that country.

The list of apples that promise well, adopted by the last Convention, was taken up, and the merits of each fully discussed, but the Melon apple was the only variety promoted to the list for general cultivation. Some specimens of that apple on the tables of the Mass. Hort. Society, surpassed in size, beauty and fairness, any we have seen, even in Western New-York, where it originated.

These discussions of the Pomological Society

are interesting and valuable. They call out the views, observations and experiences of careful observers and cultivators in different localities. Some varieties prove to be fair in one location and worthless in others. The whole subject of pears, is yet almost in its infancy, and the experiments on most kinds are limited and unsatisfactory.

While many important decisions are arrived at in these Conventions, yet enthusiastic persons are sometimes led into indiscretions, as at present indicated by the fact that Brande St. Germain, Limon, and Striped Madaleine pears were, two years ago, unanimously put on the list "which promise well," while this year, on mature deliberation, they were as unanimously degraded. Perhaps a careful vote by ballot, on varieties which any person objects to, might remedy the difficulty.

The delightful reunion at the Revere House, to which, on Thursday evening, all the delegates were invited by President Wilder, we were unavoidably prevented from attending.

The trip by the Empire State, of the Fall River Line, was as pleasant as could be desired. A good night's rest on a steady, staunch steamer, without disturbance till 5 or 6 o'clock in the morning, is a luxury to the traveler. During our stay in Boston, we found admirable quarters at the old favorite Tremont House, than which there are few or no better-conducted first-class hotels in the country.

FOREIGN GARDENERS IN THIS COUNTRY.

THE following letter was received sometime since, and would have appeared before, had we not been too much occupied to look it over carefully. The writer mistakes the design of the paragraph to which he takes exception. We are far from condemning foreign gardeners as a class; on the contrary, we highly appreciated their labors, and trust that many others will yet come over, bringing with them the experience of other lands. We think, however, that as a class, they are often too set in their attachment to foreign customs and technicalities, and that they will find it to their advantage to throw aside their conservative notions, and fall into the spirit and go-ahead tendencies of the new world. Nothing chafes a native-born Yankee more, than to come in contact with one who claims that this or that is just the course to pursue, because it is the plan followed in some foreign domain with the term "royal" prefixed. In the article alluded to, the writer aimed a blow at the obsequiousness which attaches value to any thing, simply because it is foreign or far fetched. Look over a long list of advertisements for gardeners, and in the majority of cases we shall find that it is not a good *gardener* simply that is wanted, but a *Scotch* or an *English* or a *German* gardener is sought after, just as we see a French broadcloth or silk, bringing a much higher price than an equally good or better domestic manufacture. We repeat, give us all the foreign skill and experience we can get, but infuse into it as much as possible of Yankee spirit; and let no one feel that foreign aid is *essential* or always the best, even in the matter of gardening.

We shall be glad to hear from our correspondent as often as may be, and trust he will from time to time give our readers plain practical

hints, both in regard to laying out grounds, and the best method of cultivating the various horticultural productions. His teachings in this line, if of a useful character, will be the best defence of the skill and character of his countrymen.

For the American Agriculturist.

Having seen in your widely-circulated paper, a leading article upon the beautiful house and grounds of Mr. Ketchum, at Hokanum, I observe a passage calculated to prejudice gentlemen of this country against employing foreign gardeners, on the plea that they are obliged to learn every thing over again when they arrive in this country. This, I emphatically deny. When a man has learned his business as gardener in England, and studied all his early life to obtain that knowledge which is requisite for a gardener to know, it does not matter to what quarter of the globe he emigrates, as he is perfectly aware that the plants and vines which he had under his charge in England require the same treatment and attention every where else. I am satisfied that the major part of the plants and vines in this country, have been at some time imported from Europe. I am, of course, now speaking of green-houses, and a man who understands them in England, can manage them equally well here.

I see an allusion also made to the graduates from the garden of the Duke of Devonshire. Allow me to say that there are a great many coming to this country who profess to have been there formerly, thinking this a recommendation, as it undoubtedly is. Sir Joseph Paxton being known all over the world as the Duke's head gardener—others seek to share in his fame—but by what I learn, many of these men never saw the Duke's seat at Chatsworth, nor even that part of England where that splendid mansion and gardens are situated. When men of this description take situations and fail, which they are sure to do, as many of them scarcely know a cabbage from a cauliflower, it lowers good foreign gardeners in the estimation of gentlemen requiring them. I may further add that there are at most very few graduates in this country, who have been schooled in the Duke of Devonshire's gardens. Should there be any at all in this country who have really been at Chatsworth, I am sure they would give satisfaction to any gentleman needing their services.

The only difficulty a good gardener experiences here is in the growth of vegetables, and he requires twelve months' practice to know the difference of climate and vegetation. I am an Englishman, and a graduate of the Royal Gardens of England, and can prove that I am so; and I will not give place to any man as regards a thorough knowledge of the business, extending from propagating and laying out grounds down to using the spade. Nowhere in any country is there such magnificent specimens of horticultural and floricultural skill as are met with in the exhibition tents of the London Horticultural Society's Gardens at Chiswick, the Royal Botanical Gardens of London, and others, even provincial shows, where plants and fruit are exhibited to the astonished and admiring gaze of thousands. I am sure any gentleman who has visited those floricultural displays will bear me out in this assertion. I have attended these exhibitions of skill as an exhibitor, and I may add, a fortunate one. I do not wish yourself or readers to suppose that I am against American gardeners. On the contrary, I can but admire them as a clever and intelligent class of men. At the same time I must say that because a man is a foreigner, it is very wrong to think that he is incompetent to manage a gentleman's estate, and I hope to prove at some future period myself, that this is not the case. I trust, Sir, as a lover of fair play and justice, that you will insert this in your journal at some convenient opportunity. W. SUMMERSBEZ.

Spring Hill, Flushing, L. I., Aug. 10th, 1854.

VERBENA.

PRACTICAL HINTS ON POT CULTURE.

As the Verbena merits a place, and most justly, among popular florists' flowers, perhaps a few hints on its cultivation in pots may be acceptable to those who have not hitherto adopted that mode of culture. I know of no plant more useful or ornamental as a pot-plant, for decorating the green-house during the summer season, when the proper inmates of that structure are enjoying the open air. If we take into consideration its graceful habit, the variety and brilliancy of its colors, which offer hues for every taste, and above all, the lengthened period it continues to produce its lovely blossoms, it is unrivalled and ought to be more generally grown in pots as specimens, more especially now that the numerous varieties are so much improved, both in form and color. The present season has been productive of some gems of the first class; and if the Verbena continues to be improved as it has been during these few years past, I have no doubt that the time is not far distant when it will form one of the leading features at our floral exhibitions. I do not know if my system of propagating this favorite be new; but as it is simple, certain, and expeditious, it may be as well to state how I proceed from the commencement. I fill shallow pans (such as are used for placing under flower-pots) to within a quarter of an inch of the top with silver-sand, and pour in water sufficient just to cover the sand. I then make the cuttings in the usual way, and push them into the wet-sand; put the labels to them, and place them in a hot-bed frame where the heat ranges from 65 to 70 deg., always keeping the sand wet. The advantages that are to be realized by propagating the Verbena in this way are, that the cuttings never require to be shaded in the brightest sunshine, consequently the young plants are not drawn up long and lanky; the cuttings never stop growing from the time they are put in until they are ready to pot off, which is in about six or seven days, when they may be drawn out of the wet sand, with a bunch of roots, without injuring a single fibre. The best time to commence operations for growing specimen Verbenas in pots is February, or as soon as vegetation commences for the season. It is desirable to pot a few of the best autumn-struck plants for the sake of early bloom; but they never make such handsome specimens, nor continue so long in good health, as plants raised from cuttings in spring. As soon as the cuttings are well rooted, they should be potted into 3-inch pots, and placed in a gentle heat for a few days, until they are established in the pots; then pot them, and harden them by degrees; never allow them to remain long in heat after they begin to grow, or they will form long naked stems. As soon as the pots are filled with roots, shift into 6-inch ones, and from these into 11-inch pots. During the growth of the plant, all shoots must be stopped in order to cause the plants to grow bushy; and never allow them to flower until the plant is properly formed, and has as many leading shoots as are wanted. The compost in which I grow the Verbena is, equal parts turfy loam, leaf-mold and peat, with a little silver-sand added, to keep the soil open. I water twice a-week with liquid manure, and occasionally syringe over head with clean water to cleanse the foliage. If the saving of the seed is no object, all flowers ought to be cut off as soon as they begin to decay. I need scarcely add, that the grand secret in the successful culture of this, as well as of all plants, is efficient drainage; without this no plant will continue long in good health. If green-fly should attack your plants, fumigate with tobacco; for if the fly once gets a-head, the plants will never recover sufficiently to give satisfaction. Mildew is another enemy which must be looked after. As soon as it is perceived, dust the plants with a little sulphur, which will stop it from doing much mischief.—Y., in *Gardeners' Chronicle*.

CANKER WORMS.

We clip the following extracts, relative to preventing the ravages of these pests, from a letter written by Thaddeus William Harris to the New-England Farmer:

"Fourteen or fifteen years ago, when canker worms were very plentiful and destructive in this vicinity, the use of tin collars, applied around the trunks of the trees, in the form of inverted funnels, was recommended to prevent the ascent of the female insects. In the autumn of 1852, they were employed in this place by several persons, who have reported favorably concerning them. The feet of the female insects are not provided with suckers or claspers like those of flies; and their structure seems to be such as would necessarily prevent their walking or retaining their foothold against gravity, beneath a perfectly smooth, polished and dry surface. Hence, when Mr. Everett first showed me his glass collars, I was very favorably impressed with the contrivance, and accepted his offer to apply them to some of my trees, in order to test their efficacy. Two of my cherry trees, and two small plum trees were provided with grass collars in the autumn of 1853; and these four trees have almost entirely escaped injury, while some other trees in my garden, not protected with collars or with tar, have been more or less seriously injured by canker worms. I do not consider this experiment as conclusive, because there have been some canker worms on the protected trees; those on the cherry trees may have come from two infested elm trees, growing near the fence in a neighboring lot, and so close as to interfere with some of the branches on my two cherry trees; the plum trees, on the contrary, were sufficiently distant from infested trees. Moreover, a friend tells me that he saw a female insect pass over the glass collar on one of his trees last autumn. The glass in all cases may not be sufficiently smooth; or perhaps moisture on the foot of the female or on the glass may enable the insect to stick to the glass. Further experiments in use of this contrivance seem, therefore, to be wanting before an unconditional verdict can be given in its favor. It is my intention to apply these glass collars to other trees in my garden next autumn; in the expectation that, if effectual as a preventive to the ascent of the female insect, they will prove in the course of time cheaper and better than any other remedy hitherto employed.

"Applications of tar, or of oil, according to the well known methods, if made in season, and renewed as often as necessary, have proved good remedies against the depredations of canker worms. My own confidence in them not only remains unimpaired, but is confirmed by continued experience. The use of these remedies are attended with much trouble and considerable expense, against which are to be taken into account the satisfaction and profit arising from the preservation of the foliage, the fruit, and even the continued health of the trees.

"In the enumeration of remedies we are not to forget the services of the feathered race. The warblers, buntings and other small birds devour great numbers of canker worms. Even the cherry bird earns a share of our early cherries by the havoc he makes among the canker worms. I wish as much could be said in favor of the robins, but candor obliges me to confess that insects form but a very small portion of their food, while they are unsparing in their attacks upon our cherries. Domestic fowls, if allowed to go at large among the trees during the seasons when the female insects are rising from the ground, devour great numbers of them. During the present summer, some cherry trees growing in a yard where fowls are kept have entirely escaped the attacks of canker worms; while trees in an adjacent yard from which the fowls were excluded, have had their leaves wholly destroyed by insects."—*Farm Journal*.

A HYPOCRITE is good in nothing but sighs.

American Agriculturist.

New-York, Wednesday, September 20, 1854.

TO CORRESPONDENTS.—We must again beg the indulgence of our correspondents for any apparent neglect. Our table is loaded with a "mountain pile" of communications, Reports, Show and Premium Lists, &c., which have accumulated during our interruptions from office duties for a few weeks past. Though in temporary poor health we are laboring night and day, and hope soon to get all straight.

REPORTS OF STATE AND COUNTY SHOWS.—So numerous have these exhibitions now become, and so crowded together into a few weeks are the days on which they are held, that we cannot hope to give any thing like a report in detail. We shall be obliged to any one furnishing a short report of such things as are particularly important and interesting, but we hope no one will ask us to publish a long account of proceedings which possess only a local interest. We can devote one or two pages each week to such reports as will convey information of an interesting or useful character.

FROST AS A MANURE.

WE know of no treatment so directly beneficial, for almost every class of soils as that of throwing up land in narrow ridges in the fall or early winter. There are few soils worth cultivating at all, that do not contain more or less materials which can be made available to plants by the combined action of air and frost.

Take two plots of heavy soil, side by side, and let one lie unmoved till spring, while the other is *deeply* plowed in autumn, and the result will be very visible in the spring crop. But the manner of plowing is important. To secure the greatest advantage, a single furrow should be thrown up and another back-furrowed directly upon it so as to produce a high ridge, then another ridge is to be made in the same manner with a deep dead furrow between the two. The process is to be continued thus through the whole field, so that when finished it will present a surface of high ridges and deep dead furrows succeeding each other, about once in two or two and a half feet. If prepared in this way, the frost will penetrate far downward, loosening and disintegrating the soil below the furrows, while the ridges will crumble down, and as they will not hold water, the air will circulate freely through them, decomposing the mineral portions, and conveying in ammonia and other gasses. This operation will be equal to ten or more loads of good manure upon clay or compact soils.

In the spring it will only be necessary to run a plow once or twice through the center of each ridge, and then level the whole down with a heavy harrow.

Another advantage in this process, is that when land is thus prepared it dries out and warms several days earlier in the spring. Again there are some soils that are exhausted upon the surface, but which contain poisonous substances in the sub-soil. If this sub-soil is thrown up in contact with the air and frost during winter,

these poisonous compounds (usually proto-sulphate of iron or manganese) will be destroyed, or changed to a harmless form, during the winter.

The above practice is especially to be recommended in the garden. One of the most successful cultivators of an acre of ground in our acquaintance, digs it up in the fall to the depth of three to four feet, making deep trenches and high ridges so that the whole acre appears to be covered with high winrows of hay placed closely together.

We strongly urge every farmer who has not tried this method, to lay out their plans now for experiment in this way, on a larger or smaller scale, during the present season.

WHEAT AND RYE FOR PASTURE.

THOSE who are short in grass and corn fodder, should immediately put in a good quantity of wheat or rye for pasture. The former is so much the most nutritious, that it will pay in pasture for stock, for the difference in the price of seed. The ground ought to be made rich, so as to insure a rank growth this fall. It may be pastured again in the spring, and then produce a fair crop of grain.

Farmers lose much annually, but more especially during a drouth, by not paying more attention to cultivated grasses for their stock. Under this head we name corn stalks, as well as wheat, rye, clover, &c. Even the wild sugar cane is nothing more than a grass, botanically speaking.

BORAX WASHING RECIPE.

A NUMBER of new subscribers have requested us to republish the above recipe, which appeared in a former number, (Vol. XI., page 279.) We have been waiting to give the results of some careful experiments which were being made in our own family, but which were broken off by sickness. Enough, however, was ascertained to convince us that there is really a great advantage in adding a small quantity of borax to common hard soap, previous to using it for washing. Our method is as follows: To every pound of hard soap add from one-half to three-quarters of an ounce of common borax, with one quart of water. Put the water in any convenient vessel upon the stove, add the borax, somewhat pulverized, and then put in the soap cut up in thin pieces. Keep them hot—but not boiling—for two or three hours, or until the whole is well dissolved, and then set it aside to cool, when a solid mass will be formed. If the vessel is set upon the warm stove at night, the operation will be completed in the morning, though we think it better to stir the mass just before it is cooled.

The night before washing, rub the clothes where most soiled, with the soap, and soak in water till morning. This soap, which has been more than doubled in quantity, will go quite as far, bulk for bulk, as the original, thus saving at least one half. The boiling and washing are to be performed in the usual manner; but it will be found that the labor of rubbing is diminished three-fourths, while the usual caustic or eating effect of the soap, is greatly lessened; and the hands will retain a peculiarly soft and silky feeling, even after a large washing. The preparation is adapted to all kinds of fabrics, colored or uncolored, including flannels, and it

is thought to increase their whiteness. By using this preparation, with the previous soaking over night, we have had sixteen dozen pieces finished early in the forenoon, when, by the old process, it would have been an "all day's job."

BURNING FLUIDS—EXPLOSIONS!

WE scarcely take up a newspaper which does not contain an account of one or more "Explosions" of fluid lamps. We have carefully noted these paragraphs for a long time, and we are free to say, that we have not yet found a single genuine *explosion* recorded, and we very much doubt whether ten explosions have occurred in five years past. Let any one examine the next dozen reports, and mark whether the accidents do not occur while the lamps are being filled. It is as impossible to burst a lamp when the cap is unscrewed, as to burst a gun with a thimble-full of powder with no wad over it. We have made nearly a hundred experiments upon various burning fluids, and after many careful trials, we have been unable to break a lamp of any pattern when the cup was off, although every precaution was taken to have the lamp entirely filled with a due mixture of gas and atmospheric air. Once in about forty trials we succeeded in breaking the lamp by filling it entirely with the proper mixture of fluid vapor and air, screwing down the cap, stopping up one wick-tube tightly, and then lighting the confined mixture through the other tube, which was left open for the purpose. The fact is, ninety-nine out of every hundred reported cases of "explosions," are merely the taking fire of the fluid while carelessly filling the lamp still burning, or by bringing the fluid too near another light. When this takes place, the person usually drops the lamp and can in their fright, and as a necessary consequence the fluid runs out and takes fire, and often produces serious injury.

When a lamp is nearly exhausted it becomes warm, and rapidly turns to vapor the first fluid poured in. If the wick is still burning, or another lamp is near by, this gas, which rapidly diffuses itself through the air, takes fire, producing a large *flame*, (not an explosion,) and the stream of fluid running from the can, is scattered over the person performing the operation. If the clothing is of a combustible material, serious burning often results, and the papers immediately charge the whole affair to an "explosion." The domestic herself is glad to tax to this cause a result brought about by her own careless disobedience of positive orders.

We think a great proportion of accidents would be avoided, if newspapers would state such occurrences correctly, attributing the result entirely to fire caused by sheer carelessness, for in this case greater care would be exercised than when the danger is supposed to result from a kind of inevitable explosion.

From what is said above, it will be observed that care should be taken both to avoid nearness to flame in filling, and also never to leave one of the wick tubes without a covering or a wick in it. If a wick happens to be deficient, let the tube be kept covered with an extinguishing cap, or cork it up with a bit of wood, cloth, or paper.

BETTER read little with thought, than much with levity and quickness.

CONNECTICUT STATE FAIR.

THIS commences at New-Haven, on the 10th of October. We learn from the Secretary, H. A. DYER, Esq., that arrangements are already in progress, to make this an occasion worthy of the State. It is the first State fair in the land of steady habits, but it is in the hands of men who have had some experience in other fairs, and know what needs to be done. Fifteen acres are to be enclosed as a track for the horse exhibition. Large buildings and tents will be put up for the display of horticultural and manufactured products, covered pens will be provided for stock, and every arrangement will be made for the convenience of exhibitors. The Society are particularly desirous to have a full display of the manufactures of every class. A large margin is given for articles that do not appear on the premium list, in the way of discretionary premiums.

AN EXPERIMENT WITH CONCENTRATED FERTILIZERS ON GRASS.

WHAT is the cheapest manure for mowing lands, is a question not easily answered. Probably, no one fertilizer is the best under all circumstances. We tried an experiment last spring, which has settled this question for our own premises. The lot selected for the trial was an old mowing field, laid down a dozen years ago, or more, and cutting not far from a ton to the acre. Four plots of ground, of four square rods each, adjoining each other, were measured off, staked, and numbered.

May 3d, in a rain, we sowed 15 lbs. of De Burg's super-phosphate of lime upon number one. On number two we sowed 15 lbs. of Mapes' improved super-phosphate of lime. On number three, we put 15 lbs. of Peruvian guano, that had been moistened and mixed with charcoal cinders for a fortnight. On number four, we put nothing, in order to show the natural product of the land.

A week after the application, the plot manured with the guano could be distinguished, at a distance, by its greater luxuriance, and darker green. The effect of the super-phosphate was not very manifest. About the 1st of July, the grass upon the several plots was carefully cut, dried and weighed. Number one gave 84 pounds; number two, 70 lbs.; number three, 104 lbs.; and number four, 59 lbs. The following tabular arrangement gives a better comparative view.

Manure.	Date of application	Date of Cutting.	Area	59 lbs.
Nothing.	May 3d	July 1st	1-40 acre	59 lbs.
Mapes Im. Sup. lime.	" "	" "	do	70 "
Dr. Burg's Sup. lime.	" "	" "	do	84 "
Peruvian guano.	" "	" "	do	104 "

It will be seen that the manures were applied in about twice the quantity usually recommended, or at the rate of 600 pounds to the acre. The return for Mapes' Super-phosphate of lime was 11 lbs. of hay for fifteen pounds of the manure; De Burg's gave 25 lbs.; and the guano 45 lbs.

We had purposed to cut a second crop upon these plots of ground, but the drought has been so severe that it will hardly pay. We had supposed it quite probable that the effects of the super-phosphates would be more manifest upon the second cutting than upon the first, but now, (September 1,) the after-math is look-

ing much the best upon the plot treated with guano. It may be that another season will bring number one and two up to a level with number three.

It is quite evident that it will pay well to dress old mowing fields with Peruvian guano, but it ought to be applied very early in the spring, and directly after thoroughly harrowing or scarifying the old sod. We got here in the first cutting 45 lbs. of hay for the 15 lbs. of guano, or nearly enough to pay for the manure, which we suppose will improve the yield at least for three or four years to come. In a favorable season, we should have had at least a half crop at the second mowing, half of which should go to the credit of the guano, making 71 lbs. of hay for 15 lbs. of guano.

The super-phosphates may redeem themselves another year. We shall watch the effect of these manures next season with considerable interest.

Last year, on a red clover patch, super-phosphate was more successful than guano. They were spread broad-cast on the same day early in May. We did not weigh the quantities applied, nor the quantity of clover produced—we were only judged by the eye.

CULTIVATION OF TASTE AMONG FARMERS.

It is to be feared that many of even the more enlightened class of citizens, have too little appreciation of the refined and beautiful in nature. Farmers who enjoy peculiar facilities for studying nature, and who ought to read her intelligible forms with peculiar profit, too often look on forests and meadows as valuable only to furnish food for cattle, and fuel for fire. Nor is it strange. They who have to grapple with necessities, come naturally to think those things only useful, which minister to their bodily wants. We were well acquainted with a gentleman who among cattle, or in the field, had an admirable taste, but who was quite indifferent to the beauties of a flower-garden. We used to take him into the garden, and pluck some choice flower with "See here, isn't this a beautiful thing;" but he always smiled and said, "What do you think I care about it, I had just as lief look at a dandelion;" and away he would go looking at the cucumber-vines. Now he had not so much an unnatural as an uncultivated taste. For the rich plumage and graceful flight of birds he had an excellent eye, and could listen to their notes with extreme pleasure; but he looked on ornamental shrubs and flowers as equally superfluous and useless. Like many others, he much preferred to see the ground adorned with ornamental beets and cabbages.

But it is a wrong opinion to suppose the excellence of things lies only in their utility. The Creator, it is evident, had something else in view when he made the world; nay, even loves beauty for itself alone. Else, why the delicate and varied hues of innumerable insects that float in the air; or why the beautiful organic structure of mosses and sea-weeds; or the systematic arrangement of chemical atoms! These are invisible to us except through the microscope, but they are perfectly apparent to nicer perceptions, and no doubt, administer delight.

But if farmers take delight only in building fences, and plowing fields, and rearing cattle, this, they should remember, can afford but lit-

tle pleasure to their wives. Their appropriate sphere of action is, or ought to be, about the house. It matters little with them, whether their husband's farms be enclosed with a stone fence or a hedge, whether it be stocked with Devons or Short-horns, but it does matter greatly whether her flower-garden be set off with tulips or twitch-grass. Her nice and delicate nature must have smooth lawns, and handsome trees, and laughing flowers. Such things delight her more than all the improved cattle in Christendom. But if every time she looks from her window, her eye falls on piles of brush, and ugly burdocks, and aspiring pig-weeds, what wonder that she takes more delight at her neighbor's house than at home. The truth is, her tastes, if reasonable, should be gratified. A neglected garden is just as repugnant to her nature, as a neglected farm to that of her husband. How often have we seen farmers' wives digging up a little spot of ground with a case-knife, because their husbands had no time to prepare it for them, or thought it useless. An hour's labor would have been, perhaps, all that she needed, and might have been the source of how much pleasure. It might take a little time, and might not add a dollar to the purse; but it will bring what gold can never do—a strong attachment and pure love between husband and wife. It constitutes the soil in which grow the finer sensibilities.

Cold and selfish natures may laugh at these things, but we pity that man who can range God's heritage from year to year, and think of nothing but granaries of grain. There is in waving fields a higher significance than mere grain. Grasping, miserly eyes may not see it, but it is there; and to those of high thoughts and pure conceptions, it speaks in the most forcible and eloquent language. No; if we have a shadow of skepticism, we would sooner take one stroll across the fields, and over the hills, than read volumes of books.

There is something in the dancing air, and bending grass, and waving woods, that ought to scatter doubt, like chaff, to the four winds. And farmers are just the men to study and appreciate these things. Alone to the beauties of nature, what lesson might they not learn from her spiritual teachings. How many things there are to subdue pride, to restrain melancholy, to cherish reverence, to inspire love! Truth, and beauty, and humility, and joy, beam as visibly from every plant and flower as stars in mid-heaven, not dim nor speechless, but clear and eloquent as language and pencil can make them.

If farmers would only study these things, they would find them imparting an ease and refinement to the mind which lends a charm to every thing, and without which the best natures are rough and untutored.

A UNIVERSAL applause is seldom less than two-thirds of a scandal.—*L'Estrange*.

WHEN a man owes himself to be in an error, he does but tell you in other words, that he is wiser than he was.—*Dean Swift*.

THERE are none that fall so unpitied, as those that have raised themselves upon the spoils of the public.—*L'Estrange*.

THEY who have an honest and engaging look ought to suffer double punishment, if they belie it in their actions.—*Charron*.

Scrap-Book.

"A little humor, now and then,
Is relished by the best of men."

For the American Agriculturist.

A SHORT CHAPTER ON CONSERVATISM.

I ONCE heard a gentleman make the remark, that there was no use in going through the world with your head in a bag. He wished to see what was about him, and to listen to the teachings of nature and humanity whenever they had a lesson to impart to him. He was a statesman, and the affairs of nations were as familiar to him as the daily duties of a house-keeper are to women in the ordinary walks of life.

There is always something new for the wisest to learn, and if we keep our heads out of a bag, and our eyes open, we shall be constantly improving. It is the conservative who makes no progress. He alone is satisfied with his position. He considers himself in advance of all others, while he, in fact, is sitting still, and only imagines himself moving in the right direction, because he sees the car in which others have started, and transfers its motion to that in which he remains stationary.

There are conservatives among farmers, as well as among politicians, physicians and theologians. There are conservatives every where; among the ladies, as frequently as among the lords of creation. The politician fears any innovation. He believes in the "divine right" of whatever is. The physician consults Hippocrates, but Hanneman and Priessnitz are moderns, and have no wisdom to impart. The theologian pins himself to Luther or Calvin, but Beecher, and Bushnell and Finney are surely wrong, because they cannot "frame to pronounce" shibboleth aright.

The conservative farmer is afraid of agricultural papers, and books, and plods in the way his grandfather plodded before him. He will not use a sub-soil plow, for his grandfather raised good corn and potatoes, and so did his father, and they never turned up the ground with any thing but an old-fashioned plow. A cultivator is a modern improvement, and not to be compared with a hoe—a seed-sower is a profitless innovation on the old modes of planting. What a pity it is that such people cannot find some of the implements of husbandry that were used by Noah, or his immediate descendants. In their estimation they would be the most valuable that could be found, especially if they had been used through continuous generations, down to the present time.

Conservative house-wives are equally attached to all that is old, and wish no modern improvements to make their way into parlor, kitchen, or pantry. It is surprising, that they should be so averse to inventions which would lighten their labors, and give them more leisure for intellectual improvements, and the instruction of their children. A washing-machine is of no use. It is better to rub their sheets by the hand, than to do them in one-third of the time, and with less labor, by the aid of some Yankee invention. A mangle, for smoothing clothes, cannot lift up its head among the polished sad-irons, although it would emancipate

the laundress from hours of fatigue. The numberless little contrivances to aid in domestic labor, are entirely discarded because they are new, and not sanctioned and recommended by long usage. Above all others, a sewing-machine is an abomination, and many a wearied woman sits up night after night to stitch, stitch, stitch, when in an hour, a machine would have performed the same work far better than she has done it, and have afforded her abundant leisure to woo "nature's sweet restorer, balmy sleep."

The more the intellectual and spiritual nature of individuals is developed, the more they will desire to be freed from the drudgery of unnecessary labor, and, while willing to do any thing which their circumstances render necessary, they will gladly accept any mechanical aid, which is offered them. Labor for a good purpose is always honorable; but man is something more than a mere animal, and has other wants than those which are connected with his physical nature. So long as no cunning artificer has provided him with an instrument more effective than his own hand, let him use that cheerfully, not grudgingly, but when that hand can wield a power more productive than itself, why yield the proffered aid?

There is something to me degrading in the thought, that beings, made only a little lower than the angels, should be willing to place themselves on a level, or below the level, of wood and steam, or any of those agents which may be made subservient to the comfort of mankind. I have no objection to sewing on a button, or making a button-hole, but when I find myself slowly and laboriously stitching up a seam which I am conscious a sewing-machine could do in a hundredth part of the time, and in far greater perfection than I could do it, I confess I cannot but feel that I am wasting precious moments, which once gone can never be recalled, and that I am outdone in all my efforts by lifeless, mindless, soulless matter.

ANNE HOPE.

DEFERENCE TO WOMAN.

If our great progenitrix first tempted to sin, the majority of her daughters have ever since been making amends for this bad behavior of their mother Eve, by teaching virtue. I can say, with the utmost sincerity, that the older I grow, and the more ripened grows my experience, my respect—nay, my reverence—for the sex is augmented. If I hear a good deed attributed to a woman, I believe it, of course; if I hear a woman maligned and slandered, I take it for granted that the slander is false. And in nine cases out of ten, it is false. In nine cases out of ten, any defamation of the female character arises from jealousy, or envy, or revenge, or, what is quite as inexcusable, a mere love of gossip. I value most highly the friendship of a woman;—because it is so pure, so disinterested, so utterly free from any alloy whatsoever. I consider myself most happy when I am able to add the name of an intellectual female to the catalogue of my friends. If I wanted solace in disappointment, sympathy in misfortune—nay, more, relief in adversity, to her would I resort with a most unhesitating reliance. Her heart is the very fountain of kindness; her hand "open as the day to melting charity."

The scriptures say that "a continual dropping in a very rainy day and a contentious woman are alike." But what makes her contentious? In most instances, the injustice and harshness of men. His experience in the sex must differ widely from mine, who ever knew a

woman who would not melt into softness at words of gentle remonstrance, uttered in gentle tones, as the snow melts before the sun.

There is no surer sign of a high degree of culture and enlightenment than the deference which is shown to woman. All those British travelers by whom our country has been abused, from Basil Hall to Charles Dickens, have agreed upon one thing—in giving to Americans great praise for the universal respect and tenderness which they show to ladies. When a lady enters any apartment, whether a parlor, a concert-room, or a theatre, the American gentleman rises and gives her his seat, if he sees that she has none. The French are said to be the politest people in the world. But does a Frenchman resign his seat at the opera for a stranger lady? Would he relinquish it even to one of his female acquaintances? I guess not. I am sure that John Bull would growl most vociferously if it were hinted that he was expected to do any thing of the sort. No; he would keep the seat he had paid for, if Queen Victoria were standing beside him; though it is possible that loyalty would prompt him to do what gallantry would not.

I honor this trait of self-sacrifice toward women, in my countrymen. I hope they will never be divested of it. I trust that our very finished young gentlemen, who come home from their European tour,—many with fewer new ideas in their heads than hairs on their faces,—will not bring back with them foreign notions of how "the fair sex" should be treated.

Let us rather increase than diminish our sentiments of chivalrous devotion; let us rather testify our perfect estimation of those virtues by which women are peculiarly distinguished, by the most scrupulous regard for their comfort, and a never-failing respect for their feelings.

PARK BENJAMIN.

THE FASHIONABLE OLD LADY AT NEWPORT.

A WRITER in the Journal of Commerce, over the signature of J. M. M., thus speaks of her.

There is one other representative character here, of whom I wish to say a few words. It is the fashionable *old lady*,—a character always to be found at watering places, and one eminently fit "to point a moral and adorn a tale." But, instead of describing her to you in my own words, let me borrow those of a celebrated Boston clergyman, used in the course of a sermon which he recently preached on "Old Age." He is speaking of a woman who has sought chiefly admiration of the world:

"Her life is vanity long drawn out, the only frailty which joined her to mankind. Now, she is an old woman of fashion—wearing still the garments of her earlier prime, which, short and scanty as they were, are yet a world too wide for shrunken age to fill. How ill those gaudy ruffles become the withered dew-lap that hangs beneath her chin! Her life has been a long cheat; she has had no calculation but for vanity, setting a trap to catch a compliment; it is fit her age should be a deceit. That color—the painter did it; the plumpness—it is artificial; the hair—false; the teeth—are purchased at a shop; the hands—all glove and bone, and great big veins; the tongue—it was always artificial and false, it needs no other change. Yet she apes the tread of youth. Alas! poor fly! For this you have lived; nay, flirted!—it is not life. This, then, is the end of the waltzes, and polkas, and cracoviennes; this is the pay for the morning study over dress, the afternoon prattle about it, the evening spent in putting on this gaudy attire! Poor creature! in youth, a worm; in womanhood, a butterfly; in old age, your wings all tattered, your plumage rent, a 'fingered moth,'—old, shrivelled, sick, perching on nothing, and perishing into dust; the laughter of the witty; the scorn of the thoughtless; only the pity of the wise and good! What a three-act drama is her life—youth, womanhood, age! Vanity sits there in front of the stage, known

but not seen, and prompts the play—the words, the grimace. What music it is! from the opera, the lowdest and the wildest, and from the Catholic Judgment Hymn, mingled together in the same confusion, which behind the scenes her toilet table brings to view, where you also find ‘puffs, powders, patches, Bibles, billetdoux.’ Now the audience is tired of her, and laughs at the hollow voice, the bleary eye, the spindle limbs. The curtain falls; the farce is at an end. Poor old butterfly! Death and vanity carry her between them to fitting burial and the Mercy Seat of the Infinite God.”

This is a most truthful picture of the class whom it describes; and, sad though it be, I am compelled to say it has its counterpart here in more than one instance. In the little world of five hundred boarders, temporarily inhabiting this spacious hotel, it would be strange if there were not some such characters; and the looker-on here will see as many cliques, coteries, intrigues, and rivalries as at the court of Louis XIV.

MRS. PARTINGTON'S FOUR-FATHERS.—“Why do folks make such a to-do about their four-fathers?” said Mrs. Partington to the schoolmaster who was asking her genealogy. She stopped rolling out the crust for a pie as she spoke, and, with her hands still upon the rolling pin, she looked at him over her left shoulder. “Why should folks try so hard to find out about their four-fathers, when it's full as much as many want to do to find out that they have had one?” The schoolmaster explained that people were looking more to pedigree than formerly. “Looking more for fiddle-de-dee!” exclaimed the old lady, giving the pin a vigorous and emphatic roll as she spoke. “What makes the difference how folks get here, so long as they are here? Why am I any better, now, because my great grandfather was one of the Juggernauts that left France on account of their religious notions?” Here was a mine opened for the genealogist. He never once dreamed that the antiquated dame before him could have had a grandfather, much less that she should have descended from the Huguenots. “Are you, indeed, a scion of that illustrious stock,” said he, delightedly, “whose sufferings and fidelity to their profession are monuments to their memory?” “He did suffer terribly, poor man,” replied she, “towards the last of it, with neurology in his head, and, as you say, was faithful to his profession, for a more honest tinker never soddored a tea-pot.” The schoolmaster was floored by a simplicity that looked not to ancestry for glory, depending upon its own intrinsic excellence for reputation. And who would not in the days to come, rather be that estimable woman standing there in time's expanse, holding that rolling-pin than the grimest Huguenot of 'em all? That pie beneath her hand become food for gods—that rolling-pin a golden scepter.—*Boston Post.*

“A HARD ROAD TO TRAVEL.”

It seems to be generally admitted that “Jordan is a hard road.” Jim Sherwood tells of one that, if not the veritable “Jordan” itself, must certainly be its “next best friend.” But let Sher. speak for himself.

Time, towards evening—Place, Forks of the Road, somewhere in North Carolina—Log cabin close by—Red-headed boy sitting on the fence whistling “Jordan.” Enter traveler on an old gray mare, both looking pretty well beat “out.”

Traveler.—“Say, boy, which of these roads goes to Milton?”

Stuttering Bob.—“B-b-both on 'em goes thar.”

Trav.—“Well, which is the quickest way?”

Boy.—“B-b-bout alike; b-b-both on 'em gets there b-b-bout the same t-t-time o' day.”

Trav.—“How far is it?”

Boy.—“Bout four m-m-miles.”

Trav.—“Which is the best road?”

Boy.—“T-t-they ain't nary one the b-best. If

you take the right hand road and go about a m-mile, you'll wish you was somewhere else; and if you t-t-turn back and take the l-l-left hand one, by the time you have g-g-gone half a m-m-mile, you'll wish you had kept on the other r-r-road! G'lang!”—*Exchange.*

A FRENCHMAN who knew very little English got into a difficulty with an Englishman who insisted upon fighting it out. The Frenchman agreed to this, but wished to know what he should say if he should get beaten. Being told that he must cry out “enough,” they set to. The Frenchman, however, forgot the word, and cried out, as he heard some of the bystanders do, “Hurrah! hurrah!” To his astonishment, the Englishman pounded all the harder. This caused Monsieur to go to work in such good earnest, that the Englishman soon cried out “enough!” “Say dat again,” said the Frenchman. “Enough, enough!” cried he again. The Frenchman in turn exclaiming, “Dat is de ver vord I vas trying to say long time ago!”

THE best anecdote of Lorenzo Dow that we have seen is, that being one evening at a hotel kept by one Bush, in Delhi, N. Y., the residence of the late Gen. Root, he was importuned by the latter gentleman, in the presence of the landlord, to describe heaven. “You say a good deal about heaven, sir,” said the General, “pray tell us how it looks.” Lorenzo turned his grave face and long waving beard toward the General and Mr. Bush, and replied with imperishable gravity. “Heaven, my friends, is a vast extent of smooth rich territory. There is not a root nor bush in it, and there never will be.”

THE MOMENTOUS QUESTION.—Well, Charlotte, now you have decided on the brocade, what lace do you mean to trim it with?

Why Amelia, I really don't know, what do you think?

Oh, Charlotte dear, how should I tell? What do you say to “point?” I saw some in Broadway, to-day, at \$20 the yard?

That's just the thing. Let's see—takes 20 yards, don't it?

Yes, love; and if you have any thing over, you can give it to me; if there's any thing I admire it's point lace. George says it is extravagant, but I see no fun in stinting one's self; do you, my dear!

EPIGRAM.

WHEN Eve brought *wo* to all mankind

Old Adam called her *woman*—

But when she *woo'd* with love so kind,

He then pronounced it *woomian*—

But now with folly and with pride,

Their husband's pockets trimming,

The ladies are so full of *whims*.

The people call them *whimen*.

RAILROAD DAMAGES.—A railroad accident took place awhile ago in this State, upon which occasion the attorney of the road visited the scene of disaster, to satisfy the claims of the injured parties. After paying for black eyes, bloody noses, and cracked crowns all round, at the appraisal of the injured, he supposed his business over, when he was saluted by a tall Yankee, with feet like snow-shoes, a bell-crowned hat, and a blue coat over his arm with—

“Well, Squire, what are you going to allow me?”

“You?” said the attorney, “where are you hurt?”

“Oh, nowhere to speak of, Squire, but I was most terribly scart, and I think that's worth about a dollar, the way you've been payin' on 'em.”

The “dollar” came, of course.—*Det. Inq.*

FROST.—Quite a smart frost was visible about the town of Ravenna (O.) a week ago last Friday morning.

AN ANSWER.—The Rev. Dr. Mason, of New-York, passing up Broadway, stopped to read a theatrical placard, which attracted his attention. Cooper, the tragedian, coming along, said to him, “Good morning, Sir—do ministers of the gospel read such things?” “Why not, Sir,” said the doctor; “ministers of the gospel have a right to know what the devil is about as well as other folks.”

THE LONG AND THE SHORT OF IT.—A lady passing through New-Hampshire, observed the following notice on a board:—“Horses taken into grass. Long tails three shilling and sixpence; short tails, two shillings. The lady asked the owner of the land the reason for the difference of the price. He answered:—“You see, ma'am, the long tails can brush away the flies, and the short tails are so tormented by them that they can hardly eat at all.”

WHO OUGHT TO DRINK LIQUORS?—Not the rich, for in it there is no refreshment. Not the poor, for it injures their purse, their credit, their health, their morals, their families. Not the merchant, for it will probably render him a bankrupt. Not the mechanic, for it will cause him to make promises which he cannot keep, and so lose his customers. Not the farmer, for it will make his cattle lean, his sheep hide-bound, his barn empty, and fill the windows of his house with old hats and old rags.

LOAFERS.—Different nations have different kinds of loafers. The Italian spends his time in sleeping—the Turkish loafer in dreaming—the Spanish in praying—the French in laughing—the English in swearing—the Russian in gambling—the Hungarian in smoking—the German in drinking—and the American in talking politics.

A YOUTH asked his father's sanction to his project of marriage. The old gentleman requested his son to pray with him, and prayed that if the match was against the will of the Lord, he would throw obstacles in his way, and make it impossible. The son interrupting cried: “Oh, Lord, don't you do it; for I must have her any how!”

THE WORST ISM.—“Harry,” inquired a friend the other day, which do you consider the worst of the numerous isms now prevalent?”

“Abolitionism?” inquired his friend.

“No.”

“Socialism?”

“No.”

“Nativeism?”

“No, no.”

“Then I must give it up,” replied he. “Expound.”

“Why, Rheumatism!”

A “GREENE” PUN.—The Boston Post is guilty of the following atrocity: Some negroes escaped from jail at Mariposa by boring holes with an augur. Other prisoners were placed in the same room before it was properly repaired, and likewise escaped by the *nigger augur* route.

WHEN we look at a field of wheat, we find that the stalks that raise their heads the highest are the emptiest. The same is the case with men; those who assume the greatest consequence have the least ability.

WE should choose to bear the hatred of evil men, rather than deserve their just accusation after serving their base ends.—*Putarch.*

LAYING ASIDE THE BONES.—An old man once said, "For a long period I puzzled myself about the difficulties of Scripture, until at last I came to the resolution that reading the Bible was like *eating fish*. When I find a difficulty, I lay it aside and call it a *bone*. Why should I choke on the bone, when there is much nutritious meat in use? Some day, perhaps, I may find that even the bones may afford me nourishment."

JOHN BUNYAN while in Bedford jail, was called upon by a Quaker desirous of making a convert of him. "Friend John, I have come to thee with a message from the Lord, and after having searched for thee in all the prisons in England, I am glad that I have found thee out at last." "If the Lord had sent you," returned Bunyan, "you need not have taken so much pains to find me out, for the Lord knows I have been here twelve years."

A HARD WINTER COMING.—We regret to state that the most indubitable signs of a hard winter are apparent and prevalent. Some of our oldest widowers have perfected the preliminary arrangements for entering anew the matrimonial relation. This class of our population feel the future "in their bones," and, connecting their premonitions with the high price of coal, have taken steps accordingly.—*Springfield Reg.*

THE LATEST ATROCITY.—The Pittsburg (Pa.) Democratic Union is answerable for the following: Why would it be unchristian-like for a woman to assume the part of a man? Because she would become a *he* then.

SAVAGE.—A person, looking over a catalogue of professional gentlemen at the bar, with a pencil wrote against the name of one who was of the bustling order, "He has been accused of possessing talents." Another seeing it, wrote under, "He has been tried and acquitted."

THE Irishman in New-York, who replied to the questions of the excise commissioners, "Ah, shure it isn't much moral character a man needs to sell the likes of whiskey," told a volume of truth.

A LABORER on the levee was sun-struck yesterday. The use of brandy restored him.—*Cin. Sun.* Then it would seem that brandy is of some use, after all.—*Dayton Empire.* So is arsenic.—*Dayton Herald.*

COLD neglect of friends, when in poverty, is more severe than poverty itself.

DEBT subjects a man more to slander than crime.

NEVER ridicule what you cannot understand.

NOTICES TO SUBSCRIBERS.

PREPARED COVERS.—We have prepared for Vol. XI. and XII., a lot of uniform muslin covers, with gilt backs, &c., similar to the first ten volumes. These will be sent to subscribers for 25 cents each. The binding can easily be completed by any book-binder for 25 cents. Those sending their files to the office can have them bound for 50 cents per volume.

VOLUME XII. COMPLETE.—We can supply sets of Vol. XII. complete. Bound or unbound. Price bound, \$1 50; unbound, \$1 per volume.

CLUBS.—Now is a good time to get up clubs. For terms see the last page of former numbers. Three, Five, Ten or Twenty persons by joining together can save considerable in the cost.

A complete volume—six months—will be sent to each of six persons for five dollars. They may be at different post-offices.

Cannot a large number of single subscribers get several of their neighbors to subscribe at the regular prices, and secure their own paper free of cost, and perhaps save something more to pay for his trouble.

SPECIMEN COPIES.—We will send a free specimen copy to any person whose name and address is forwarded to us. Our present readers will confer a favor by sending us the address of their agricultural friends and acquaintances in different parts of the country.

In forwarding names or subscriptions, please give the Post-office, County, and State. Let each be written out plainly.

From the Mark Lane Express, Monday, August 28.

REVIEW OF THE BRITISH CORN TRADE.

THE official return of the importations into the United Kingdom during the month ending the 5th inst., has just been published, from which it appears that the supplies from abroad have been on a much less liberal scale than in the month immediately preceding. The arrivals during the last three months have been as follows:

	June 5.	July 5.	August 5.
Wheat,	611,992 Qrs.	357,104 Qrs.	281,950 Qrs.
Barley,	78,016 "	43,704 "	101,679 "
Oats,	158,355 "	126,008 "	110,017 "
Rye,	4 "	369 "	—
Beans,	37,476 "	21,895 "	29,181 "
Peas,	7,600 "	5,439 "	6,255 "
Maize,	158,696 "	147,071 "	106,677 "
Flour,	373,761 Cwts.	222,479 Cwts.	250,103 Cwts.

In previous years we have generally had the largest supplies towards the latter part of the summer, but this season the fact of our extensive wants was known so early after the harvest of 1853 had been secured, that all that could be got together was shipped off early, and about the time that the bulk of the imports usually reaches us, stocks abroad had been reduced into a very narrow compass, and the probability is that the receipts of foreign grain, &c., will be on a comparatively small scale, until such time as supplies of the new produce begin to come forward at the different shipping ports. This we regard as rather a fortunate event, as well for the holders of what remains in warehouse as for our farmers. Even with this advantage, however, sellers will have to make up their minds to a lower range of quotations, as there can be no doubt that the crops in this country will give a very excellent yield. *As harvest is proceeded with, it is being discovered that, notwithstanding partial blight, the bulk of Wheat is heavier than was expected before cutting was commenced, and we have great pleasure in stating that, when we estimated the probable yield of Wheat some weeks ago at rather over an average, we were below the mark; we are now of opinion that if the weather should prove tolerably auspicious, so as to allow the remainder to be well secured, the excess would be considerable.* We have already heard of several instances where the quantity per acre has proved large, and it has all along been admitted that the breadth of land under cultivation has been greater this year than for some seasons past. Barley is unquestionable a heavy crop; and Oats are equally well spoken of.

The weather has been rather unsettled during the week; in this immediate neighborhood, indeed all over the southern parts of the kingdom, it has been sufficiently fine to allow fair progress to be made with the carting of grain; but in the north-west part of England, in Scotland, and in Ireland, the work has been seriously interrupted by frequent heavy showers. In Ireland the rain has been more general than on this side of the channel, and the reports from thence are not altogether of so satisfactory a character as could be desired. The Potato disease is certainly very prevalent there, and it is much to be feared that a large portion of that useful root will be lost.

The advices from the North of Europe in regard to the probable result of the harvest are not so universally good this week as they were previously. A considerable quantity of rain appears to have fallen on Monday and Tuesday last, which had interfered with the carting of Corn, and would, it was feared, be productive of some injury to the quality. The information

is altogether too vague and uncertain as yet to allow of any definite conclusions being arrived at; but the estimates as to the general result of the harvest in Germany, Poland, &c., are not quite so favorable as they were a few weeks ago. We are, nevertheless, of opinion that the yield of Wheat will prove good, and that of Spring Corn large, in all the countries bordered by the Baltic.

Markets.

REMARKS.—Flour has fallen the past week from \$1 to \$1 25 per bbl., and sales are dull, even at this great concession. Wheat is scarcely less in price, owing to the small quantity in market, and the pressing wants of the millers. As soon as more plenty here, its price will correspond with that of flour. Corn as per our last. Pork, Lard, Beef, and Butter, a slight downward tendency. Clover Seed is a trifle less, Timothy in active request. Wool has sold largely the past week, but at lower prices. It is hoped it has got down now about as low as it will go this season.

Cotton is a little better; Sugar and Tobacco the same. Owing to the late hurricane at the South, Rice has advanced fully $\frac{1}{2}$ of a cent per pound.

The Weather is all we could desire now, for the season. We have had another abundant rain, followed by a clear, bright sun. Vegetation has revived with surprising rapidity, and all late crops are growing finely.

PRODUCE MARKET.

Saturday, Sept. 16, 1854.

THE prices given in our reports from week to week, are the average *wholesale* prices obtained by producers, and not those at which produce is sold from the market. The variations in prices refer chiefly to the *quality* of the articles.

The day is as fair as ever dawned, and the weather charming, but charming weather may be incompatible with good markets. Notwithstanding the fears of an anxious public, the appearance of Washington Market to-day is quite against starvation. The prospect is that society will not be reduced to regular rations for some time to come. We sincerely hope that generous commissioners and produce dealers will becalm themselves, and not be over anxious for the fate of society the coming winter.

Potatoes to-day are a little on the rise. Cabbage, Melons, &c., are high as usual. Grapes begin to appear in market. There will, undoubtedly, be large quantities in next week, and so all along. Cranberries also made their first appearance to-day. Eggs are a little higher.

VEGETABLES.—Potatoes, Mercers, \$3 50 @ \$4 bbl.; White, \$3 25 @ \$3 75; Sweet, Virginia, \$3 50; New-Jersey, \$4; Onions, red, \$1 75 @ \$2 bbl.; white, \$3; Turnips, Russia, \$2 75 bbl.; white, \$2 50; Beets, \$3 50 hundred bunches; Carrots, \$3; Parsnips, \$3 50; Tomatoes, 75c @ \$1 basket; Marrow Squashes, \$1 50 bbl.; Cabbage \$6 @ \$12 hundred; Watermelons, \$8 @ \$16 hundred; Nutmeg, \$2 @ \$3 bbl.; Pumpkins, \$4 @ \$10 hundred; Cucumbers, 75c @ \$1; Pickles, \$2 @ \$3 thousand.

FRUITS.—Apples, \$1 @ \$2 bbl.; Pears, common, same; Virgaliou & Bartlett, \$8 @ \$12 bbl.; Peaches, \$2 @ \$2 50 basket; Plums, Egg, \$4 bushel; Grapes, Isabella, 8c @ 10c. per lb.; Cranberries, \$7 @ \$8 per bbl.; Butter, State, 21c @ 23c. lb.; Western, 15c @ 17c.; Eggs, 18c. doz.; Cheese, 10c @ 11c. per lb.

NEW-YORK CATTLE MARKET.

Monday, Sept. 18, 1854.

The weather, since our last report, has been delightful, which, if it makes the cattle feel more cheir, fails to improve their flesh. As we went the rounds this morning, we could but wish the republic of beef-eaters had been with us to see what beef is sometimes made of. Such a burlesque on fat-cattle is rarely to be seen, as we saw to day in Washington Yards. Sealy, long-boned, spars-ribbed steers, flourished there beyond all conception, while slab-sided old cows with their calves, filled up the interludes. We have no doubt but there are fifteen hundred cattle in market to-day, which never had so much as a smell of corn-meal. And yet they, are sent to New-York Market as beef, and in less than a

week will have been sold from the shambles, and "played their part."

We are glad to make even a few exceptions to this herd of so-called "grass-hoppers." We observed a drove of some 50 cattle from Connecticut which that State has no reason to be ashamed of. They were owned by Ezra Barsley, and were very large and in fine order. Another drove, 186 in number, belonged to Samuel Ulery, and came from Chester Co., Pa. They were young cattle, well fattened and the best in market.

Best quality of beef sold to-day from 8½¢@10¢ per lb.; inferior quality 7½¢@8½¢. "Critters" sold from 6¢@7½¢, and at any price.

We remark that the Sheep market has greatly improved within the last week.

The following are about the highest and lowest prices.

Beeves,	7½¢@10¢.
Cows and calves,	\$30@70
Veals,	4¢@6½¢.
Sheep,	\$3@8
Lambs,	\$2@6 50
Swine, corn fed, 4½¢@4½¢; still fed, 4¢@4½¢.	

Mr. Chamberlin reports beeves, 7¢@10¢; cows and calves, \$20@50; calves, 4½¢@7¢; sheep, \$2 50@5 50; lambs, \$2@3 50.

Mr. Browning reports beeves, 7½¢@10¢; cows and calves, \$25@50; sheep, \$2@7; lambs, \$2 50@5.

Mr. O'Brien reports beeves 8¢@10¢; cows and calves, \$25@40; veals, 5¢@6¢.

Washington Yards, Forty-fourth street.

A. M. ALLERTON, Proprietor.

RECEIVED DURING THE WEEK.	IN MARKET TO-DAY.
Beeves, 2526	2463
Cows, 33	
Veal Calves, 288	
Sheep and Lambs, 1250	
Swine, 400	

Of these there came by the Hudson River R. R., 600; Hudson River Boats, 200; Erie, 1,200; Harlem, 314. New-York State furnished 319 on foot; 66, by cars; Ohio, 685; Illinois, 575; Pennsylvania, on foot, 253; Kentucky, 293; Connecticut, 121.

RECEIVED DURING THE WEEK.	CHAMBERLIN'S.	BROWNING'S.	O'BRIEN'S.

STATE OF NEW-YORK.—SECRETARY'S OFFICE, Albany, Aug. 10, 1854.—To the Sheriff of the County of New-York:— Notice is hereby given that at the GENERAL ELECTION to be held in this State on the TUESDAY succeeding the first Monday of November next, the following OFFICERS are TO BE ELECTED, to wit:

A Governor, in the place of Horatio Seymour;
A Lieutenant Governor, in the place of Sanford E. Church;
A Canal Commissioner, in the place of Henry Fitzhugh;
and

An Inspector of State Prisons, in the place of Henry Storms;
All of whose terms of office will expire on the last day of December next.

A Representative in the Thirty-fourth Congress of the United States, for the Third Congressional District, composed of the 1st, 11th, 12th, 13th and 14th Wards in the City of New-York; for the Fourth District, composed of the 15th, 16th, 17th and 18th Wards in the City of New-York; for the Fifth District, composed of the 19th and 20th Wards in New-York, and the City of Williamsburgh in Kings County; for the Sixth District, composed of the 21st, 22nd and 23rd Wards in New-York; for the Seventh District, composed of the 24th, 25th and 26th Wards in New-York; and for the Eighth District, composed of the 27th, 28th and 29th Wards in New-York.

County Officers also to be selected for said County;

Sixteen Members of Assembly;
A Surrogate, in the place of Alexander W. Bradford;
A Recorder, in the place of Francis R. Tillou;
A City Judge, in the place of Welcome R. Beebe;
A Mayor, in the place of Jacob A. Westervelt;
A Register, in the place of Garrett Dyckman;

A Commissioner of Streets and Lamps, in the place of George G. Glazier, who was appointed to fill a vacancy caused by the resignation of Henry Arcularius;

A Police Justice for the Second District, in the place of Daniel W. Clark, who was appointed to fill a vacancy caused by the death of John McGrath;

Two Governors of the Alms House, in place of Gustavus A. Conover and William Pickney, appointed to fill vacancies;

A District Attorney, in the place of Lorenzo B. Shepard, who was appointed to fill a vacancy caused by the death of Nathaniel H. Blunt;

A Civil Justice and a Police Justice for the Seventh Judicial District, composed of the 11th, 12th, and 13th Wards; and

A Police Justice for the Eighth Judicial District, composed of the 14th and 15th Wards. Yours respectfully,
E. W. LEAVENWORTH, Secretary of State.

SHERIFF'S OFFICE, NEW-YORK, Aug. 14, 1854.
The above is published pursuant to the notice of the Secretary of State and the requirements of the statute in such case made and provided.

JOHN ORSER, Sheriff of the City and County of New-York.
All the public newspapers in the County will publish the above once in each week until the Election, and then hand in their bills for advertising the same, so that they may be laid before the Board of Supervisors and passed for payment. See Revised Statutes, volume 1, chapter 6, title 3, article 3, part 1, page 140. [53-60] JOHN ORSER, Sheriff.

FOR SALE—TWO SHEPHERD DOGS, A MALE AND FEMALE, of pure scotch blood, and three months old, can be had of ANDREW C. MURRAY, Factoryville, Staten Island, N. Y., at \$10 each.
53-55

FRUIT TREES FOR SALE

I HAVE NOW READY FOR SALE ONE OF THE MOST complete selections of fruit trees ever offered in this part of the country; and as thrifty and handsome trees as can be found in the United States apples, pears, peaches, plums, grapes, quinces, strawberries, &c. Subscribers to this paper will find in it the coming year full directions for managing fruit trees in best manner, with a complete list of the best varieties.
WM. DAY, Morristown, N.J.

[53-62] ASHER HANCE & SON.

FANCY FOWLS.—SHANGHAI FOWLS—DIRECT IMPORTATIONS—and Golden Pheasants for sale by
53-58 WM. DAY, Morristown, N. J.

WHEELER AND WILSON MANUFACTURING COMPANY'S IMPROVED SEWING MACHINES, manufactured at Watertown, Conn. Office and Warerooms, at 343 Broadway, N. Y.

These Machines have been in successful operation, in the hands of manufacturers and families, for the past two years, and in every case have given universal satisfaction. The Proprietors are now prepared to offer them to the public, with that increased confidence in their merits which the united testimony of their numerous customers has strengthened and confirmed.

These Machines are entirely different from any other, the principles on which they are made being *exclusively* our own.

Among the advantages of this Machine over any others are the following:

1. The simplicity of its construction, and the ease with which it can be kept in the most perfect order.
2. The perfect manner with which the operator is enabled to stitch and sew the various kinds of work, from the finest linen to the coarsest cloths.

3. It particularly excels in the rapidity with which work can be executed; in that respect it has no equal.

4. The little power required to propel them, enabling even those of the most delicate constitution to use them without injury to their health.

We are now manufacturing a larger sized Machine, more particularly adapted to the sewing of leather, canvass bags, and the heavier kinds of cloths.

An examination of our Machines is respectfully solicited at our Office, 343 Broadway. 37-55

A NEW FERTILIZER.

THE LODI MANUFACTURING COMPANY, (who have been manufacturing Poudrette for the last 14 years) have, by a recently-discovered process, been enabled so completely to disinfect Night Soil, as to present to the Agricultural World, that long sought after and greatly to be desired article.

PURE NIGHT SOIL, DISINFECTED AND DRIED.

This article differs from Poudrette, and every other article of manure made from human excrement, from the fact that it contains no mixture of foreign substance whatever (except 3 per cent. of calcined gypsum, which is used to retain any fugitive ammonia.) the sulphuretted hydrogen which is the offensive gas escaping from Night Soil, is taken from it by a peculiar process. It is, also, entirely separated from rubbish not smaller than a pin's head, and so concentrated, that its bulk is decreased one-half by manufacture, yet, at the same time, none of its virtues are allowed to escape. The Lodi Manufacturing Company have selected the Chinese words designating desiccated night soil as the name for this article, viz.:

TA-FEU.

and offer it for sale under the following guarantees:

1st.—That it is free from unpleasant odor, and contains 95 per cent. of night soil concentrated, and 5 per cent. of calcined gypsum, and *nothing else*.

2d.—That it cannot be surpassed by any other manure in the world, either in fertilizing power or in cheapness.

3d.—That it is equal to Guano in the proportion of 4 pounds of Ta-feu to 3 pounds of Guano. That it is equal to any superphosphate of lime now in market *pound for pound*, on any crop, and is one-third cheaper than Guano, and twice as cheap as super-phosphate.

4th.—It contains every kind of good necessary to the growth of plants, and is perfectly soluble in water, making, therefore, a splendid *top-dresser* on grass and grain.

It is perfectly dry, and can be bagged or barreled, and sent to any part of the United States. Price \$30 per ton, of 2,240 lbs., for any quantity over 10 tons; under that, \$25. No charge will be made for cartage or package.

Persons wishing to try it, can send us any amount, from \$3 upwards, and the exact number of pounds will be forwarded, with directions for use.

We recommend it strongly on cabbage plants, turnips, wheat, grain and grass, either sowed or harrowed in, or as a top-dressing, after the grain is up. On cabbages and turnips it has already been tried with astonishing results, having doubled the size of cabbage plants in a week.

From 300 to 500 lbs. per acre will be a first-rate dressing for grass in the fall, and for grain followed by grass; a table-spoonful is more than sufficient for a cabbage plant.

All communications must be addressed to the:

LODI MANUFACTURING COMPANY.

49-54

74 Cortlandt St. New-York.

FOR SALE AT THE SOUTH NORWALK NUBERRY A fine stock of the NEW-ROCHELLE, (OR LAWTON) BLACKBERRY PLANTS, at six Dollars per Dozen; also the White Fruited Variety at 8 dollars per dozen; also the new pure Red Antwerp Raspberry.

Apply to JOHN F. CLEW,

50-53 Or, Hyde Park, N. Y.; 90 Maiden Lane.

THE HORSE, THE HORSE,

NOBLEST OF DOMESTIC ANIMALS.

AND THE ONE MOST FREQUENTLY ILL-TREATED, neglected, and abused. We have just published a book so valuable to every man who owns a Horse, that no one should willingly be without it. It is entitled,

THE MODERN HORSE DOCTOR,

and is from the pen of that celebrated English Veterinary Surgeon, Dr. GEO. H. DADD, well known for many years in this Country, as one of the most successful scientific and popular writers and lecturers in this branch of medical and surgical science. The book which he now offers to the public is the result of many years' study and practiced experience which few have had.

From the numerous and strong commendations, of distinguished men and the newspaper press, we select the following:

Extracts from a letter from Hon. John H. Clifford, Ex-Governor of Mass.

NEW-BEDFORD, May 11, 1854.
Dr. Dadd,—Dear Sir:—I hope your new work on the noble creature that man has ever been permitted to hold in subjection (the Horse) will meet with that success, which all your efforts in this direction so well deserve.

Your obedient servant, JOHN H. CLIFFORD.

From Hon. Marshall P. Wilder,

BOSTON, MAY 13, 1854.
Dr. DADD,—My Dear Sir:—I am greatly obliged to you for the valuable treatise, the results of your own investigations, which you have recently issued, hoping that it may meet with the patronage of a discriminating community.

I remain yours with great regard, MARSHALL P. WILDER.

The "Modern Horse Doctor," by Dr. G. H. Dadd, is a manual of genuine science, and ought to be owned and studied on the score of humanity, as well as interest, by every man who owns a horse.—Boston Congregationalist.

Dr. Dadd has had great experience in the cure of sick horses, and explains the secret of his success in this vol.—N. Y. Tribune.

The author of this work is well known as a most skilful veterinary surgeon. His book is based on the soundest common sense, and as a hand-book for practical use, we know of nothing to compare with it.—Yankee Blade.

We know Dr. Dadd well, and are satisfied that he possesses most important qualifications for preparing such a book as this.—New-England Farmer.

Messrs. Jewett & Co. have just published a very valuable work by Mr. Dadd, a well-known veterinary surgeon, on the causes, nature and treatment of disease, and lameness in horses.—Farmer's Cabinet.

This is one of the most valuable treatises on the subject, ever published; and no owner of that noblest of the animal race, the horse, should be without it. Especially should it be in the hands of every hotel and livery-stable keeper. To many a man would it be worth hundreds of dollars every year.—Ind. Democrat, Concord.

By far the most learned and copious work on the horse and his diseases, we have ever seen.—N. Y. Evangelist.

One of the greatest and most commendable qualities of this work, is, it is practical and plain to the comprehension of those farmers and others for whom it is mainly designed. The course of treatment favors generally a more sanative and rational system of medication than that recommended in any previously existing works on farriery. No farmer or owner of a horse should be without this book. Stable keepers, stage proprietors and hackmen we believe would derive profit by having at least one copy hung up in their stables for use and reference by their stable men.—Daily News, Philadelphia.

There is more common sense in this book than any of the kind we have ever seen, and farmers and owners of horses would find it a matter of economy to possess themselves of it. It will be of more service than the counsel of a score of ordinary doctors.—Albany Courier.

We deem this decidedly the best and most reliable work on the "Cause, Nature, and Treatment of Disease and Lameness in Horses," ever published.—Nantucket Inquirer.

What we have read of this book induces us to regard it as a very sensible and valuable work; and we learn that those much more competent to judge of its value, have given it their unqualified approval.—Ev. Traveler, Boston.

This book supplies a great desideratum which Skinner's admirable treatise on the Horse did not fill. Every man may be his own veterinary surgeon, and with much greater safety to this noble animal, than by trusting him to the treatment of the empirical itinerants who infest the country. It is well illustrated, and should be purchased by every man who owns a horse.—Ev. Mirror, N. Y.

This is a book that should be forthwith put into the hands of all who own or drive horses, whether for the dray or gig, for the plow, omnibus or road, for hard service or pleasure.—McMakin's Courier, Philadelphia.

A good, clearly-written book, which should be in the hands of every man who has a horse whose ills his affection or his purse make it worth while to cure.—Bangor Mercury.

It is a valuable book to those who have the care of horses.—Hartford Herald.

This is a scientific, thorough and complete treatise upon the diseases to which one of the noblest of animals is subject, and the remedies which they severally require.—Troy Daily Budget.

He is not worthy to have a horse in his care, who will not use such a work to qualify himself for his duties to this animal.—Commonwealth, Boston.

Published by JOHN P. JEWETT & CO., Boston, JEWETT, PROCTOR & WORTHINGTON Cleveland, Ohio. For sale by all Booksellers, 50-63.

DEVON CALVES.

THREE DEVON BULL CALVES—PEDIGREES WILL BE given—for sale by Edward G. Faile, West Farms, Westchester County, N. Y.

SHORT-HORN CATTLE AND SHEEP FOR SALE.

THE FOLLOWING SHORT-HORN AND OTHER STOCK, (all pure bred animals,) were sent out by Mr. Rotch, of Morris, Otsego Co., N. Y., to his farm, situate one mile from Albion, the county-seat of Edwards Co., Illinois, and are now for sale, as the farm is to be disposed of. For further particulars address Col. Hudson on the premises.

Cuba.—A red and white bull, calved April 17, 1853; got by Prophet, dam Coral, by Bertram 2d, (3144;) gd Conquest, by Washington, (1566;) eggd Pansey, by Blaize, (76;) eggd Primrose, by Charles, (127;) eggd, by Blythe Comet, (75;) eggged, by Prince, (521;) eggged, by Patriot, (486;).

Prophet is a grandson of Yorkshirerian, (5700,) who was bred by Mr. Thomas Bates; his dam Phoenix, entered in herd book, Vol. V, page 736, as produce from Princess, &c. *Tea Rose*.—A roan cow, calved May 2, 1848; got by Westchester, dam White Rose, by Splendid, (6297;) gd Yellow Rose, by Young Denton, (963;) gd Arabella, by North Star, (460;) eggd Aurora, by Comet, (155;) eggged, by Henry, (301;) eggged, by Danby, (190;).

Westchester was by Yorkshirerian, (5700,) by thus making Tea Rose a descendant on the bull's side, from the Kirkleavington herd.

Prize Rose.—A red heifer calf from Tea Rose, by Prophet. See pedigree of Tea Rose.

Phasant.—A red heifer calved in the spring of 1852, by Prophet, dam Phlox, by Yorkshirerian, (5700;) gd Phoenix, by Hero, (4020;) gd Princess, by Washington, (1566;) eggd Pansey, by Blaize (76;) eggd Primrose, by Charles, (127;) eggged, by Blythe Comet, (85;) eggged, by Prince, (521;) eggged, by Patriot, (486;).

The number of this combined English Herd-book, where the full pedigree of each animal may be found.

Besides the above, there are a few South-downs, and a few French merino sheep and lambs, all purely bred, Dorking fowls, &c.

FOURTEENTH ANNUAL CATTLE SHOW AND EXHIBITION

OF THE NEW-YORK STATE AGRICULTURAL SOCIETY, HELD IN CONNECTION WITH THE AMERICAN INSTITUTE AND NEW-YORK HORTICULTURAL SOCIETY, AT HAMILTON SQUARE, IN THE CITY OF NEW-YORK, OCTOBER 3d, 4th, 5th, AND 6th, 1854.

THE ANNUAL EXHIBITION OF THE SOCIETY WILL be held, as above, in the City of New-York, from Oct. 3d to 6th, on which occasion upwards of Eight Thousand Dollars are offered as premiums to be contended for with Cattle, Horses, Sheep, Swine, Poultry, Dairy Products, Farm Implements and Machinery, domestic and other Manufactures, Flowers, Fruits and articles in all the mechanical departments, the full particulars of which will be found in the List of premiums published. A large portion of the Premiums are open to competition by persons out of the State. It is believed that this combined Exhibition will be the most extensive ever held in this country, and will afford to exhibitors, advantages never before offered in every department of the Exhibition, combining the entire industrial interest of the farmers, manufacturers, mechanics, horticulturists and artisans of our country.

Persons desirous of examining the list of Premiums and Regulations, or of entering stock, implements, or other articles for exhibition, will go to B. P. Johnson, Secretary, State Agricultural Rooms, Albany, at the Rooms of the American Institute, 351 Broadway, or James, Beebe & Co., 356 Broadway, New-York, where the Premium List and Regulations will be furnished, and every desired information in relation to the exhibition given.

Stalls and fodder, for stock, and articles for the other articles will be provided in season so that all articles designed for Exhibition can be taken to the show grounds on their arrival in the City where they will be provided for and protected.

The following Railroads have agreed to transport all stock and articles on exhibition free, requiring the freight to be advanced on delivery and repaid on return of the articles with evidence of being exhibited &c.: Hudson River, New-York and Erie, New-York City and Buffalo, Ithaca and Owego, Canandaigua, and Elmira, New-York Central, Rome and Watertown, New-York and Harlem, Long Island, Troy and Boston, and it is presumed all the Railroads leading into New-York, will afford the like facilities.

Application to transport articles, should be made in season to the nearest Station Agent.

B. P. JOHNSON, Sec. WM. KELLY, Pres.
Aug., 1854. 49-53

AGRICULTURAL IMPLEMENTS.

AGRICULTURAL IMPLEMENTS.—THE SUBSCRIBER keeps constantly on hand, and offers for sale the following valuable implements:

Fan Mills of various kinds, for rice as well as wheat, rye, &c. Grain Drills, a machine which every large grain planter should possess. They are of the best patterns, embracing most valuable improvements.

Smut Machines, Pilkington's, the most approved for general use.

Hay and Cotton Presses—Bullock's progressive power-presses, combining improvements which make them by far the best in use.

Grain mills, corn and cob crushers, a very large assortment of the best and latest improved kinds.

Horse Powers of all kinds, guaranteed the best in the United States. These embrace, 1st, The Chain Power, of my own manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, and economy. They are universally approved wherever they have been tried. 2d, The Bogardus power, for one to four horses. These are compact, and wholly of iron, and adapted to all kinds of work. 3d, Eddy's Circular Wrought Iron Power, large cog-wheels, one to six horses, a new and full of power. 4th, The Iron-Sweep Power, for one to four horses. 5th, Warren's Iron-Sweep Power, for one or two horses.

RAIN MILLS, STEEL AND CAST IRON MILLS, AT \$6

to \$25, and Burr-Stone at \$50 to \$250, for Horse or Steam Power.

TILE MACHINES.—FOR MAKING DRAINING TILES OF all descriptions and sizes.

WATER RAMS, SUCTION, FORCE, AND ENDLESS-chain Pumps; Leather, Gutta Percha, India Rubber Hose, Lead Pipe, &c.

CALIFORNIA IMPLEMENTS OF ALL KINDS, MADE EXPRESSLY for the California and Oregon Markets.

DRAINING TILES OF ALL FORMS AND SIZES.

CLOVER AND TIMOTHY SEED HARVESTER.—A newly-patented machine, will harvest 10 or 12 acres per day with one horse.

HAY AND COTTON PRESSES.—BULLOCK'S PROGRESSIVE-IVE Power Presses, combining improvements which make them by far the best in use.

THRESHERS AND FANNING-MILLS COMBINED—OF

Three Sizes and Prices, requiring from two to eight horses to drive them, with corresponding horse powers. These are the latest improved patterns in the United States.

SOUTHERN PLOWS—Nos. 10 1/4, 11 1/4, 12 1/4, 14, 15, 18, 18 1/2, 19, 19 1/2, 20, A 1, A 2, 50, 60, and all other sizes.

CORN-SHELLERS, HAY, STRAW, AND STALK-CUTTERS Fanning-Mills, &c., of all sizes.

1-4t R. L. ALLEN, 189 and 191 Water street.

HORSE POWERS THRESHERS AND SEPARATORS.—

The Endless Chain or Railway Powers of our own manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, durability, and economy. They are universally approved wherever they have been tried.

2d, The Bogardus Power, for one to four horses. These are compact and wholly of iron, and adapted to all kinds of work.

3d, Eddy's Circular Wrought-iron large Cog Wheels, for one to six horses. A new and favorite power.

4th, Timble's Iron-sweep Power, for one to four horses.

Threshers—Improved Threshers upon the best principles, threshing clean with great rapidity, and scarce ever breaking the grain.

One-Horse Undershot.....\$25

Two-Horse do.....\$30 to \$35

One-Horse Overshot.....\$33 to \$38

Two-Horse do.....\$33 to \$38

Separator, which greatly facilitates cleaning the grain and preparing it for the fanning mill.....\$7 to \$10

All the above-named machines are guaranteed the best in the United States.

WILLARD FELT, NO. 191 PEARL STREET, (NEAR

Maiden Lane.) Manufacturer of Blank Books, and Importer and Dealer in Paper and Stationery of every description. Particular attention paid to orders 26-77

STOCK.

IMPROVED STOCK OF ALL KINDS.—HAVING HAD great experience in breeding and rearing fine stock for the past twenty years, I offer my services to my friends to procure it of the best and most reliable kind. As much notice as convenient is at all times desirable previous to purchasing, as it takes time to make good selections. Early in August or September is the best time to purchase for the South.

Short Horn or Durham cattle, Devons, Herefords, Alderney or Jersey and Ayrshires. Long-wooled Sheep—the Cotswold, Oxford, Leicester, Bakewell, and Lincoln. Mutton Sheep—the Southdown, Fine-wooled Sheep—such as the Saxon, Spanish, and French Merino.

The public should be on their guard in purchasing improved stock, as many animals are palmed off upon the unsuspecting and ignorant, which are spurious.

A. B. ALLEN, Nos. 189 and 191 Water.

Special Notices to Subscribers, Correspondents, &c.

Subscriptions can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September as a half yearly volume of 416 pages, with a complete Index—begins on each of those dates.

Those wishing their papers changed from one office to another, should give the name, county, and State, of their old and new Post-office.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by Mail, this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then enclose them in the presence of the Post-master. Give the Post office, and the County and State. *Write these very plainly.*

Economical Arrangement to furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished	
with Harper's Magazine, one year for	\$4 00
" Putnam's do	4 00
" Knickerbocker do	4 00
" Eclectic do	6 00
" Little's Living Age do	6 50
" National Magazine do	3 50
" Dickens's Household Words	3 50

Address ALLEN & CO.,
189 Water street, New-York.

J. A. GRAY, Printer, 95 and 97 Cliff street, N.Y.

PUBLISHERS' ANNOUNCEMENT!

Thirteenth Volume of THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

THE AMERICAN AGRICULTURIST,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the Agriculturist.

N. B. The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume for the bound work.

COMPREHENSIVE IN ITS CHARACTER,

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers only that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon *its own merits*; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammeled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the editorial supervision of Mr. A. B. ALLEN,—its principal editor for the first ten years—and Mr. ORANGE JUDD, A.M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical agriculture, and, in addition to these, a number of other eminent agricultural and horticultural writers.

All the editors are men practically experienced in their profession, each of whom can handle the Plow as well as the Pen.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers,	-	-	\$2.00 a year,	\$2.00
" Clubs of 3 do.	-	-	1.67 "	5.00
" do. 5 do.	-	-	1.60 "	8.00
" do. 10 do.	-	-	1.50 "	15.00
" do. 20 do.	-	-	1.25 "	25.00

The money always to accompany the names for which the paper is ordered.

The Post-Master, or other person sending a club of ten, will be entitled to one extra copy gratis. The Post-Master, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, *Weekly Tribune*, or *Weekly Times*, or any other paper or periodical in this city, not costing to exceed two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if enclosed and mailed in the presence of the Post-Master.

Communications for the paper should be addressed to the Editors; subscriptions, advertisements, and all matters relating to the business department, should be addressed to the Publishers,

ALLEN & CO.,

WINTER APPLES FOR SHIPPING.

We wish to obtain one hundred barrels of the best kinds of winter apples to send to Europe. The best keeper, and the only sort which we know to improve by a voyage across the Atlantic, is the Newtown Pippin. Some other sorts will keep pretty well, but we know of none whose flavor is improved by the voyage.

We shall be obliged by any information on this subject, more especially from those who have shipped the Baldwin apple, Northern Spy, Russet, Lady apple, &c.

Great care should be taken in picking, packing, and transporting apples which are to cross the Atlantic. The least bruise is prejudicial to their keeping. They should be hand picked from the trees, and placed in tiers, with the stems up, in dry barrels, then tight headed and transported on sleds or spring carts to the point of shipment. Every apple should be of good size and as perfect as possible.

Some practise sweating the apples for a few days in heaps on a covered floor. Then wipe them dry and pack. Others say that the sweating is of no benefit to them, and that they will sweat over again in the barrels quite as much as if packed in the barrels as fast as picked from the tree. Having no personal experience in the sweating of apples previous to packing, we shall be obliged to any one having experimented both ways, who will inform us of the result of these experiments.

TO CORRESPONDENTS.

We will answer J., of Salem county, in full, privately, if he will send us his address.

SUB-SOIL PLOW, MOWING MACHINE, LIME, &c.—M. S., of Coverdale, is informed that the price of Sub-soil Plows, is from \$5 50 to \$12. That costing \$8 50, would probably answer, though the one costing \$12, is the best for hard, stony ground. It would require two to four stout horses to draw one, dependent upon its size, the nature of the soil, and how deep it went into it. The largest size, costing \$12, will stand as long as the best of other kinds of plows. It would be decidedly beneficial to sub-soil your land, especially in the fall of the season. If the meadows are quite wet, they should be first drained. The Mower and Reaper require smooth ground, though if rolling, it is no objection. We will give you the names of the best, and prices, next May, if you will put

us in mind of it. Great improvements will be made in them the coming winter. We should think line at a shilling a bushel would pay at the rate of 20 bushels or so per acre, applied every two or three years, till three applications are made.

MACHINE FOR MAKING DRAINING TILES, &c.—E. R. J., of Acadia. The price is \$250. We could not tell, until we saw your soil, how far the drains should be apart. They might require to be two rods, if very tenacious; if not, from three to six rods apart. Suppose you experiment on an acre or so at different distances, and give us the result? We cannot send covers of the *Agriculturist* by mail.

CURRENTS, SWINE, &c.—A. H. M., Lancaster City. The best kind for you is to take females of the great Chester county white breed, of your own State, and cross them with a Suffolk boar. The price of them is \$25 to \$50 per pair, according to quality, &c. Currant stalks will grow from the seed, though it is better to set out roots or slips in the fall or early spring.

MONMOUTH (N. J.) COUNTY SHOW.

The first Show of this Society was held at Freehold, on the 21st inst. We spent a couple of hours there very pleasantly, and are very free to say that under all the circumstances of inexperience, &c., the Exhibition was very creditable to the officers of the Society, and all others who had any hand in getting it up. There was a very general turn out from various parts of the county. The display of stock, farm products, specimens of mechanical industry, &c., were very good. We have only room to speak of one thing which especially pleased us, and which is worthy of imitation elsewhere. We refer to the exhibition of a printing press by Mr. Morford, of the N. J. Standard, which was kept in active operation, throwing off for free distribution, a large sheet containing a business directory of Keyport. We should be glad to speak of the exhibitions of fine sets of harness, excellent drawings, including those of agricultural implements, by pupils of the Freehold Institute, &c., &c.

WESTCHESTER COUNTRY SHOW

Came off at White Plains, on the 21st and 22d insts. The Society labored under difficulties this year, the chief of which was, that the New-York State Show, to be held so soon after, kept many back from the local exhibition. The display, however, was very creditable, and the exercises quite interesting. One of the best features was the introduction of several speeches on practical subjects, during both days of the show.

Friday afternoon Dr. A. J. PRIME, of White Plains, gave the regular annual address. He was followed by Hon. A. B. CONGER, of Rockland county,—a practical farmer by the way—and Mr. ORANGE JUDD, of the American Agriculturist, who were called out by special request of the Society. They occupied an hour and a half in discussing deep plowing, the potato crop, benefits of fall plowing for spring crops, &c. The remarks were listened to with considerable interest, and the speakers received a vote of thanks, and were elected Honorary Members of the County Association.

This Society is fortunate in having a very efficient and active set of officers to direct its affairs.

HARTFORD (CT.) COUNTY CATTLE SHOW AND FAIR.—The annual Exhibition of the Hartford County Agricultural Society, will take place on the first week in October, commencing on the 3d, and continuing on Wednesday, Thursday, and Friday.

The exhibition of stock will take place at the South Park, in Hartford, on Thursday, the 5th of October; of Horses and Colts at the same place on Friday the 6th. The trial of plows will take place on Wednesday, the 4th, at 10 A. M., and the plowing match will take place on the afternoon of the same day.

AGRICULTURAL CAPITAL.

THE American farmer, who has won his way to a condition of comfort and reasonable independence, from a beginning of comparative poverty, and struggled on to his present estate amid the privations incident to daily toil, may be somewhat startled at the subject of our present writing, and ask, what beyond his farm, and the stock upon it—and that not involved in debt—is its meaning? The trader in commodities, the financier, the banker, and the political economist, understand the term *capital* to signify money, or that representation of value which will best aid him in prosecuting his business to its most productive result.

Some farmers practically understand the importance of capital as employed in their immediate business; but from our own observation we lament to say, that the mass, so far as its best application is concerned, do not. Versatility of employment is the grand fault of the American people—a proneness to dive into every occupation in which one sees his neighbor successful, even to leaving his own vocation, by which he has made sure, though moderate gains, and if steadily persevered in, would, in time, make him rich. This is a national characteristic, induced by the numerous enterprises

continually opening to the activity and industry of our native population in a comparatively new country—enterprises too seductive in their promises of gain, and of promotion in life, to be withstood by the ambitious aspirant to fame and fortune. This characteristic has its benefits, also, in giving that rapid progress to the country which has placed it far, in useful material, and valuable institutions, in advance of any people or nation with which we are acquainted.

With this spirit of enterprise we are not disposed to quarrel. Let it proceed in its own way, and to its crowning point of success. The world is all the better for it; but in the way of staid and sober calculation as applied to agriculture, we have to take an entirely practical view of this branch of our national industry. To illustrate our meaning, let an instance be selected.

Two young men start in life. One is bred a farmer, the other a mechanic—and both without capital. Their strong arms, a hopeful spirit, a tolerable education, and integrity of character, are their sole dependence for success. One obtains employment on the farm, the other in the work-shop. In process of time, one becomes the owner of a moderate farm, in debt perhaps for a part of its value—the other is master of his own work-shop. So far they run on parallel lines. The farmer still goes on; he becomes independent, so far as debt is concerned, perhaps increases his acres, while the mechanic becomes an extensive builder, machinist, or manufacturer, and keeps his *accumulating* capital in his own business, or at such command, that he can at any time apply it where required. In this he has but imitated the merchant, and others engaged in different pursuits, who have succeeded in them, so long as such pursuits occupy their attention, and require the use of capital in their prosecution. But the farmer, so far equally successful, up to the acquisition of a comfortable farm, stops short in the application of the accumulating capital to the increase of his agricultural resources, or the improvement of his *landed* estate. He invests his surplus gains in stocks of various kinds, in securities, perhaps in town lots, or in the bricks and mortar of a neighboring town. In the midst of all this, his farm may one-half remain an unreclaimed swamp, the buildings be of an inconvenient and insufficient kind; and although in public estimation he may be a tolerable farmer, yet a considerable share of his estate may be unproductive and uncultivated, and serves only to hold together the better fractions of it, from which, with hard labor, he obtains his yearly income to invest in objects foreign to his legitimate business. Possibly, too, yielding to the clamors of an ambitious family, he has rented out his farm, removed into an adjoining village, and turns politician, or public man, or commences the laudable calling of shaving notes at two or three per cent. a month, while his children are aspiring—the sons to get into professions already over-crowded, or to chance and *genteel* ways of livelihood, the daughters, each to make an eligible match with the village shop-keeper or the young attorney.

The narrative part of our argument is pursued sufficiently far to illustrate the fact (the truth of which will be readily acknowledged,) that the application of active capital stops at the very point where its employment becomes

most useful to the farmer, while those engaged in other pursuits apply their means more earnestly to the extension or improvement of their own particular branches of business. So far as agriculture is concerned, it is altogether a mistaken one. Few branches of regular business pay better than farming, with an intelligent application of capital. There are lands, we know, which are not worth improving, in this country of cheap and good land, and these we throw out of the question. But, suppose a farmer has one hundred acres of land capable of becoming productive. Sixty acres of it are in cultivation. Forty acres are in swamp, or other unavailable condition. The good land is worth fifty dollars an acre, the other, ten dollars; but in reality, if reclaimed, the best land on the farm, and the expense of reclaiming it is but an additional ten dollars the acre. His capital is therefore worth fifty per cent. a year to him for several years, invested in the very swamp which he before considered worthless, besides being a creation of so much productive wealth to him and to the country, as his aforesaid swamp has added to its annual ability to produce a crop.

Draining is another branch of investment to which a large amount of capital may be employed. If to a field yielding twenty bushels of wheat to the acre, or a corresponding quantity of other products, twenty dollars per acre be expended in draining it, so that it will yield thirty to forty bushels with the same cultivation as before, the value of the field is doubled in its profitable capacity for production. And thus with every department of the farm. If better constructed buildings add to the convenience and economy of labor within them, to a greater security and preservation of the crops and the grains, or the better care of the farm stock, so far are they fit objects for the investment of money in producing revenue, and equally well worthy the farmer's attention.

So also with the plantation of orchards, the improvement of farm stock, and the production of various things which but now and then attract the attention of the farmer, in the common way. In short, the farmer should seek no other object for the investment of his money, beyond the improvement of his estate for productive purposes, until he is assured such further improvement will cease to be advantageous. His thought and study, in gainful objects, should be confined to his own business, as the thought and study of those engaged in other pursuits is confined to theirs; and if he loves his employment, as he should do, he will find ample sources of investment akin to that of agriculture, which will furnish him abundant opportunities to employ all his spare time and means to advantage.

This is a fertile subject of discussion, which will call for future observation in the course of our editorial labors, and will be resumed as occasion may offer.

STATE FAIR POSTPONED.

THE premium list, circulars and posters, of the Fifth Annual State Fair, under the direction of the Board of Agriculture, have been very generally circulated, announcing the Fair to commence on the 19th of September! Very extensive and satisfactory arrangements have been made for the convenience of visitors, and the grounds and every thing are in such a state

of forwardness as would have insured their completion in time. But, owing to the sudden outbreak of sickness at Newark, which may not be over by the 19th of September, the Executive Committee, under the circumstances, deem it advisable to *postpone* the Fair.

The public will please take notice that the Fair is accordingly postponed, to commence on *Tuesday, the 17th of October*. The only change will be as to *time*. The arrangements for the accommodation of visitors, and all the rules and regulations for conducting the fair, as already published in our circulars and handbills, will remain unaltered. The interval will be diligently improved, and the committee feel confident that they will be able to give additional interest to the great exposition of the industry to of the State, on the 17th of October.

R. W. MUSGRAVE,
JAMES. L. COX,
J. SULLIVAN,

Columbus, O., Aug. 31st, 1854.

For the American Agriculturist.

LEXINGTON, KY., CATTLE SHOW.

LOUISVILLE, Ky., Sept. 17, 1854.

I ARRIVED here yesterday from Lexington, where I attended the Kentucky Fair. The show-grounds were finely located on an eminence overlooking the city, about one mile distant; and the arrangements within the enclosure did great credit to the good sense and taste of the managers. The concourse in attendance was immense. The ladies of the city and surrounding country, were out in full force, evincing as much interest in the display of fine stock, and the awards, as the male part of the crowd. They were neatly and tastefully attired, and presented such an array of beauty as I have never before witnessed in one assembly.

The first day, Tuesday, 12th inst., was devoted to fancy articles and agricultural implements, of which latter, very few samples were on the ground.

The second day, the world-renowned Short-horns of Kentucky, were on the ground in great numbers; and notwithstanding I was prepared to think highly of this far-famed stock, I was almost ready to exclaim with her majesty of the olden time, that the half had not been told. Being one of the judges on this day, I had an opportunity of examining critically (as far as my judgment extends) the fine animals competing for premiums. It was hard to select where all were fine; but I must notice particularly the bull *Chilton*, of the importation of 1853, belonging to Messrs. Warfield, Wasson & Co., and a yearling belonging to Mr. Bedford, of the Renwick stock. These animals obtained the first premium in their class. The cows and young stock were of a high order of merit. The young stock doing much credit to their breeders. The lot of two year old heifers were the most choice animals I had ever seen, not one but could lay claim to the highest order of excellence. One of the Renwick stock proved the victor, as was usual wherever they came in competition.

The third day was devoted to the horses, the display being very fine both in thorough-bred and horses for all work. The ladies, as before, appearing much interested in the awards.

The fourth day the jacks and mules were pre-

sented, the show was said to be very good. I was on the ground but a small portion of the day, as my time was limited. I availed myself of the offer of my kind host, Mr. Joseph Wasson, (whose hospitality, by the way, was meted out to me with a liberal hand during my stay in Lexington,) to take a drive about the adjoining country, during which we visited the farms of Messrs. W. & B. Warfield, where I had an opportunity of seeing their stock in undress, having seen a portion of it before, slicked up for the show. They looked equally as well in their grazing grounds as in the arena. I again here saw *Chilton*, and also the bull *Renwick*, the sire of a number of prize animals at the show. He is now eight years old, and one of the finest bulls I have ever seen. The farms of the Messrs. W. appear to be judiciously and profitably managed, and the owners to be of the true Kentucky stamp.

The whole country surrounding Lexington is beautiful and lovely beyond description. I passed Ashland, the late residence of Mr. Clay. The old mansion is levelled with the ground to arise again in a more beautiful and enlarged form. The farm is a most choice and lovely spot. I had many invitations from gentlemen in the neighborhood to visit their places, but being obliged to leave on Saturday morning, I was unable to accept. E. H. S.

ODE FOR AN AGRICULTURAL CELEBRATION.

BY WILLIAM CULLEN BRYANT.

FAR back in the ages

The plow with wreaths was crowned,
The hands of kings and sages
Entwin'd the chaplet round;
Till men of spoil
Disdain'd the toil

By which the world was nourish'd,
And blood and pillage were the soil
In which their laurels flourish'd,
—Now the world her fault repairs,
The guilt that stains her story;
And weeps her crimes amid the cares
That form'd her earliest glory.

The proud throne shall crumble,
The diadem shall wane,
The tribes of earth shall humble
The pride of those who reign;
And who shall lay
His pomp away;
The fame that heroes cherish,
The glory earn'd in deadly fray,
Shall fade and perish,
—Honor waits, o'er all the earth,
Through endless generations,
The art that calls the harvest forth,
And feeds the expectant nations.

For the American Agriculturist.

IS CLOVER INJURIOUS TO HOGS?

WILL you, or some of your correspondents, inform me whether or not young clover is injurious to hogs? I have lately heard it said to be, and in proof of it, was told of some instances in which several hogs had died immediately after being put on clover in spring. I should be glad to know more about it, *without trying it*, as I design next spring to turn my hogs on clover. THOS. R. JAYNES, JR.

Accomac C. H., Va., Aug. 27, 1854.

SEED CORN.—Now is the time to select ears of corn for seed. Go into the fields and pluck off the earliest ears, and such as are well filled; and you will gain something by selecting from stalks that have two ears on them. It is important that you select in the field, and before all the ears are hard, for thus you will gain several days in the ripening next year.

We think it probable that a majority of our farmers neglect to select their seed ears till the time of bushing. But then they cannot determine certainly whether they take the earliest ears.

Corn is so important a crop, and so much of it is often lost by early frosts, that it is of much consequence to plant that which will ripen early. We cannot urge the planting of the small Canada corns in our latitude, for it is better to lose occasionally part of a large crop than to be always limited to a small one. We need not go north for seed ears, if we will take a little care at the right time, and select the ears which first come to maturity. Many farmers know the importance of taking for seed what ripens earliest, but they are apt to forget and neglect.

REAPING AND MOWING MACHINES.

THESE machines are becoming of so much interest to the agricultural community, that we deem it proper to lay before our readers the number, description, and date of invention of a *portion of them*; for we have no idea the indefatigable chronicler has enumerated all the inventions of this machine, which were in use during the Roman Empire, and may have had its origin in ages previous among the Greeks, Egyptians, or *their predecessors* in civilization and the useful arts.

One thing we think highly probable, to wit., that the improvements hitherto made in these machines, have pretty much covered every one possible to me made; and we much doubt if those discovered many years ago, have not embraced nearly every thing that is valuable in such as have been since patented.

In the publications of the Patent Office, Bennett Woodcroft, brings before us at one glance, in a tabular form, no fewer than 69 examples of drawings of "the cutters of reaping-machines," illustrative of their modes of action; and since that date about 30 new patents have been taken out, in many of which alterations have been made in the cutting apparatus; and besides these, numbers are noticed, of which no drawings are given. The following table without the drawings will, with the observations which follow, give a general conception as to the progress of ideas, and the different channels in which they have run:

RECTILINEAR MOTION.	CIRCULAR MOTION.
Advancing only, - 4	Continuous and advancing, - - 31
Sidelong and advancing, - - 2	Continuous and alternate, - - - 2
Reciprocating and advancing, - 25	Cutters worked by hand, - - 5

Such is the state of things at the date in question; and our readers will perceive how nearly to be equally balanced, so to speak, are the above two classes under rectilinear and circular motion, there being 31 of the former and 33 of the latter.

The progress of ideas, however, is still more interesting; for up to the introduction of American machines, although reciprocating and rectilinear motion was invented in Bedfordshire, by Mr. Salmon, as early as 1807, the general pursuit appears to have been after circular; for we only find two examples of the former in this

country, viz., Ogle's in 1822, and Bell's in 1826; and three in America, viz., Manning, 1831; Hussey, 1833; and McCormick, 1834; while we have twenty-one of the latter, viz., Pitt, 1786; Boyce, 1799; from Walker's Philosophy, inventor unknown, one in 1799; Plucknett, 1805; Gladstone, 1806; Plucknett, 1807; Smith, 1811; Ken, 1811; Cumming, 1811; Dobbs, 1814; Smith, 1815 (two examples); Mann, 1820; Baily (United States,) 1822; Budding, 1830; Chandler (United States,) 1835; Springer, 1839; Duncan (United States,) 1840; Phillips, 1851; Gibson, 1846; and Whitworth in 1849 (two examples.)

Subsequently the tide of invention has run more strongly in favor of the reciprocating action of the knife, there being seventeen examples on this principle, viz., McCormick, 1850; Stacey, Dray, Ridley, Randall, McCormick, Poole, Crosskill, Dray, Fowler, Newton, Wray and Son, Harkes, Hussey, Johnson (two examples,) and Gompertz, all in 1852; and eleven on the circular, viz., Fairless, Winder, Beckford, Gosling, France, Mackay, and Trotter, in 1851; and Mason, Smith, Gompertz (two examples,) and Burch, in 1852.

Of American patents the following are noticed:—French and Hawkins, 1803; Adams, 1805; Comfort, 1811; Claiborne, 1811; Gailard, 1812; Baker, 1814; Bailey, 1822; Wadsworth, 1824; Cope and Hoopes, 1825; Eyck, 1825; Pleasants, 1827; Lane, 1828; Ingersoll, 1830; Manning, 1831; Heath, 1833; Anderson, 1833; Schrebbly, 1833; Hussey, 1833; Jackson, 1834; McCormick, 1834; Ambler, 1834; Rundell, 1835; Sturdivant and Holmes, 1835; Chandler, 1835; Badlam, 1835; Ashmore and Peck, 1835; Wilson, 1835; Briggs and Carpenter, 1836; Allen, 1836; Moore and Hascall, 1836; Drummond, 1836; Greenleaf, 1836; Lewis, 1838; Wheeler, 1838; Brittain and Silnens, 1838; Trask and Aldrich, 1839; Lamb, 1840; Hinds, 1840; Churchill, 1841; Church, 1841; Cooch, 1841; Read, 1842; Brown and Crans, 1842; Reeder, 1843; Peck, 1844; Esterly, 1844; Ketchum, 1844; McCormick, 1845; West, 1845; Woodward, 1845; Ketchum, 1846; Darling, 1846; Foster, 1846; Owen, 1846; Wilson, 1846; Land, 1846; Cook, 1846; Foster, 1847; Church, Obert, Willoughby and Willoughby, 1847; Dunlap, 1847; Ketchum, 1847; Hussey, 1847; Butts and Church, 1847; McCormick, 1847; Pease, 1848; Boone, 1848; Goble and Stuart, 1848; Cushing, 1848; Barr, 1849; Haines, 1849; Fountain and Fountain, 1849; Hinton, 1849; Penvance, 1849; Platt, 1849; Mann and Mann, 1849; Manny, 1849; Forbush, 1849; Krauser, 1849; Adkins, 1850; Heath, 1850; Knowles and Benington, 1850; Pierson, 1850; Danford, 1850; Bowerman, 1850; Herndon, 1850; Hunt, 1850; Quincy, 1850; Baily Coates, 1850; Watson, 1850; Neely, 1851; Hurlbut, 1851; Watson, Sabine, and Watson, 1851; Allen, 1851; Stardt, 1851; Palmer and Williams, 1851; Jones, 1851; Seymour, 1851; Miller, 1851; and Manny, 1851.—Total, 99.

No description is given of a number of the first machines; so that the difference between first ideas there and here cannot be known; but Bailey's (1822) and Ingersoll's (1828) have cutters fixed on the periphery of a horizontal wheel, the latter 8 feet in diameter, forming a complete circular knife or scythe, similar to Plucknett's (1805) of this country. Revolving hooks and scythes appear to have been a common idea, even after Mr. Manning produced his reciprocating-knife, which has been so successful. He also proposed fixing lance-shaped cutters or blades on the periphery of a horizontal wheel, sharp only on one edge. Two other ideas are deserving of special notice, viz., to cut and thrash the grain at the same time, and to cut and bind it. As yet both are comparatively failures, but the object at issue is worthy of our transatlantic cousins. Our Australian colonies have produced a successful example, both reaping, threshing, and dressing at the same time. Many of the inventions, again, are

chiefly directed to the gathering of the corn into sheaves after it has been cut.

Of the above 69 illustrated examples on Mr. Woodcroft's table, nine are American, so that we have a grand total of 160 reaping machines produced by both countries up to 1851 and 1852, or about 200 up to this date; and, looking upon them as a whole, they certainly form an interesting combination of the mechanical powers to obtain a given result—the harvesting of corn.

The work of reaping embraces three things: the cutting of the corn, the gathering or disposal of it after it is cut, and the application of power to perform or overcome the resistance experienced in both these operations.

The cutting-apparatus of the whole is pretty faithfully exemplified by the 69 illustrations already noticed in a tabular form, showing the different modes of action and numbers embracing each; and even among these there are many parallel cases, only distinguishable by some comparatively unimportant alteration in the details, apparently more for the purpose of evading a previous patent than obtaining a really useful mechanical improvement, while many inventors have evidently been reducing the same ideas to practice unknown to each other. For example: Boyce and Walker, 1799; Plucknett, 1807; Chandler, U. S. A., 1835; Duncan, U. S. A., 1840; Beckford and Gosling, 1851, and Mason, 1852, differ so little from each other that they may be said to belong to one manufactory; while ditto may be said of Gompertz and Burch, 1852, they being only double, or composed of two horizontal wheels with hooks on their peripheries moving in opposite directions on the same shaft, instead of single or only one wheel; Whitworth, Fairless, France, Mackay, and Springer again may be called bastard examples of the same mechanical family. Of circular cutting-knives, similar to what Mr. Harkes exhibited at Lincoln, (No. 7 in the trial report,) we have no fewer than six illustrations, viz., Plucknett, 1805; Gladstone, 1806; Smith and Kerr, 1811; Bailey, U. S. A., 1822, and Whitworth, 1849, almost identical, while Dobbs, 1814, and Scott, 1815, present similar knives, only with serrated edges; Scott's, 1815, and Gibson's, 1846, present a new feature, the cutting blade of the knife projecting beyond the periphery of a similar horizontal wheel to the last—the former serrated, the latter smooth; while we find Manning, 1831, and other American examples on the same principle, not illustrated. Mann's, 1820, belongs to the same class. Another class of ideas appear to have had for their object the cutting of corn by means of a series of small smooth cutting edged wheels, advancing horizontally with their peripheries a little past each other, so as to cut like scissors; each pair moving inward, as feeding rollers do. Of the 31 examples of continuous and advancing motion, 4 belong to this class, viz., Cummings, 1811; Phillips, 1841, '43, and '52; Winder, 1851; and Gompertz, 1852. Smith's, 1852, lanceolates the periphery of his small wheels. The remaining 3 examples—Pitt, 1786, Budding, 1830, and Trotter 1851—present new features each. The first is a drum, composed of a series of circular saws, which strip off the corn. It is, in short, circular motion given to the stripping apparatus of the old Roman machine. The second is a grass-mower, too well known to require further notice; and the third, we fear, displays more ingenuity than usefulness, being four pair of revolving shears, which clip the corn as they advance. Budding's and Ridley's Australian machines ought properly speaking to have formed an intermediate class between the circular and rectilinear motion, as they embrace both; but of this more when we come to the manufacture of machinery for reaping and threshing at the same time, for the fine climate of our southern colonies, now attracting so much attention.

Among the 25 reciprocating knives, there is also a great similarity—so much so, that there is little mechanically to distinguish many of them from each other. They may, however,

be grouped into four or five sub-classes: First, Salmon, 1807; Bell, 1826; Stacey, Ridley, and Harkes, 1852—five examples where the knife moves on a pin-like shears. Ogle's 1822 and M'Cormick's two examples of 1854 have a straight reciprocating knife; one of the latter being serrated, which in mechanics is merely a rougher edge; the smoothest edge appearing more serrated than it, under a powerful magnifier. It has, however, advantages in practice, from its remaining longer sharp, or in cutting order, which justly entitle it to a patent, and preference over a smoother edge, according to the present process of things; but at a great expense of power in the working. Next we have the American examples of Manning, 1831, Hussey, 1833, and M'Cormick, 1850—the latter a serrated edge—with fifteen other examples—two of which have double knives—Rundell, U. S. A., 1835, and Wray and Son, 1852, and two with hollow, or skeleton cutters, Randell and Hussey, 1852, similar to those exhibited at Lincoln by Mr. Dray, and one by Johnson, with curved projections. The knife of Forbush, U. S. A., 1849, called a "triangular hollow cutting tooth," appears to have been the first skeleton one used. The remaining example of the 25 is a species of shears, recommended by Gompertz, 1852, and of considerable ingenuity, but not much usefulness it is feared.

The two examples of "sidelong and advancing" motion have knives fixed on an endless chain; the one invented by Lillie in 1847, and the other by Exall, 1852. Of the American examples, not illustrated, there are of this kind, Ketchum, 1847, Platt, 1849, and Pierson 1850.

The four "advancing only" contains the old Roman knife, which cuts on the same principle as a weed hook; Gladstone's bean-cutter, a skeleton plow, with a serrated wing in place of mold-board, invented in 1826; Esterly, U. S. A., 1844, a straight edge, like a levelling-box, for cutting corn (?); and Blackie, 1851, a large triangular knife, worked like a snow-plow.

The five "cutters worked by hand," are the English hook, and scythe; Javanese hook or "ani"; Meares' large shears, on two wheels, invented in 1800; and Taylor's horizontal revolving hook, on a vertical shaft, driven by an auger handle, 1851.

Such is the cursory review of the "forms and movements of the cutters of reaping implements" proposed. First, we have the reaping-hook, coeval almost with our race, by which the corn is cut and gathered at the same operation. Second, the scythe, a very old implement also, by which the operations of cutting and gathering are performed separately. Next, the Roman lance-toothed comb, where the cutting, gathering, and harvesting are rudely performed at once. Then commences a series of improvements. Pitt, in 1786, giving a circular motion to the Roman knife; Boyce, in 1799, fixes hooks on the periphery of a horizontal wheel. In 1800 another old implement is brought to bear upon the harvest-field by Meares, viz., a pair of large shears, moved on two wheels, and having a gathering-bow fixed on the back of each blade. The shears are open, wheeled forward into the standing grain, when the handles, formed like those of a plow, are brought together, the shears cutting the grain, at the same time the bows on the back holding it fast. The operator then draws the machine back on its wheels, opens the handles, allowing the grain thus to drop in handfuls or small sheaves, as first ideas may have run, when the open shears are again pushed forward. In 1805 Plucknett brings out his circular scythe, by placing scythes on the circumference of a wheel, as Boyce had done hooks six years previously. In 1807 Salmon improves Meares' shears by driving a series of them by means of reciprocating action. Dobbs, in 1814, puts a serrated edge on Plucknett's circular scythe, while Scott in the following year places serrated blades on the horizontal wheel of his predecessors. Ogle, in 1822, invents his reciprocating knife, and mo-

tion being communicated by a horizontal working beam, moved alternately by cogs on the two wheels on which the machine is borne. In 1831, Manning (U. S. A.) places upon Ogle's knife Scott's projecting blades, having two smooth cutting edges, producing reciprocating action by means of a crank, as Salmon had done. In 1834, M'Cormick (U. S. A.) moves Ogle's knife in the same manner, and also serrates its straight edge, as Dobbs had done the circular of Plucknett. In 1850 he produces Scott's projecting blades on Ogle's straight reciprocating knife, now serrated, as Scott himself had done 35 years previously on the periphery of Boyce's horizontal wheel. Then follows a long list of minor alterations of projecting blades on Ogle's reciprocating knife, in order to improve its cutting edge and motion, with which our readers generally must be familiar; and lastly, Harkes' improvement on Plucknett's circular scythe at Lincoln.—*Mark Lane Express.*

THE CORN CROP.

CINCINNATI, Sept. 12, 1854.

As the corn crop is now the great question, and the newspapers have so misled the public, that every farmer begins to think that there is no corn except in his immediate vicinity, I will give you the result of my observations after traveling over most of the Western States. I am forced to believe that, with the increased breadth of land planted, there will be a full average crop. Wisconsin and Iowa will have (in the increased breadth planted) 50 per cent. more than an average crop.

Illinois will have a full average crop—an excess in Northern Illinois, which will more than make up for the deficiency in Southern Illinois. Missouri does not raise any season much corn, but the portions of the State where they raise the most have fair crops, while, in other portions there is a falling off.

I should say the State would produce three-fourths of an average crop.

Indiana and Ohio have a full average over two-thirds of those States; the other one-third may average one-quarter short. Kentucky has in many sections an average crop, while in some counties there is not more than one half an average; but, I should think, taking the whole State, there would be two-thirds to three-fourths of an average crop.

Tennessee, the great corn State, it is now generally admitted, will have an average crop; while there is a large excess over any former year in Mississippi, Louisiana, Alabama, and Georgia.

The wheat and oat crops throughout the West, are much the largest ever grown, and the grain crops are much better!

I hear every where bad accounts of the potato crop, and also of most kinds of vegetables.

It is estimated that the number of hogs in the West is 25 per cent. over last year; and the question is, whether they will be all fattened. I have not yet seen any section of country where there was not corn enough to fatten all the hogs. Even in Kentucky, where there is the greatest scarcity of corn, I feel confident all the hogs large enough for killing the coming season, will be fattened—some, perhaps, that would have been kept over with a large corn crop. The census of Kentucky and Indiana shows a surplus over last year of 800,000 hogs; so that, as far as corn and hogs are concerned, no one need starve, and the alarm and panic that the newspapers and speculators have created have done much injury to the consumer.

I found every where a large quantity of old corn. It is estimated that on the banks of the Illinois river there is now a million and a quarter bushels of corn; and in the immediate vicinity, there not being room on the river, as much or more waiting a rise in the Illinois river; and the average price back from the river, is 20 to 25 cents per bushel. Agreeable to your request, I have given you my views on the state of the crops, etc., after a careful examination.—*Corr. of Jour. of Com.*

ANECDOTES OF POULTRY.

In the autumn of 1853 I had a small brood of Spanish Chickens. The mother hen left them when very young, and roosted with the other fowls. Thus deserted, a Cochon Cock took to them, brooding them under his wings with the greatest care, both by night and by day.

A BLACK HEN TURNED WHITE.—I had a black hen without a colored or white feather about her. She laid very well; sat twice during the summer, and brought up one lot of eleven chickens. She was kept up in the stall of a stable until the chickens were near three months old. She then began to lose her feathers, and when the new feathers came, half of them were perfectly white; her bill and feet, which had been dark-colored, became also white. She resumed laying, and brought up chickens. I then parted with her to a friend in the country, who now informs me that she has changed her coat, and is perfectly white. I cannot myself account for such a change, unless it was with being kept up so long with the chickens that she was deprived of procuring the proper food for coloring the feathers.—A. W. Z., in *Poultry Chronicle*.

SELF-REGULATING WINDMILL.

DANIEL HALLIDAY, a mechanic in an obscure country village, Ellington, Connecticut, has done what the world of mechanics have sought for in vain for centuries. He has invented and put in successful operation a windmill with *self-furling sails*. The mill built by him has five feet wings, that is, the diameter of the wind wheel is ten feet, and it has been in operation for six months without a hand being touched to it to regulate the sails. It runs fifteen days at one time without stopping day or night, and it has stood through some hard gales; the beauty of the improvement is, that it does stand still when the wind rages hardest, with the edge of the wings to the wind, and as it lulls, they gradually resume their position for a gentle breeze. It is so contrived that nothing but a squall of great severity falling upon it without a moment's warning can produce damage.

The mill mentioned has drawn water from a well twenty-eight feet deep, one hundred distance, and forced it into a small reservoir in the upper part of the barn, sufficient for all farm purposes, garden irrigation, and "lots to spare." The cost of such a mill will be \$50, and the pumps and pipes about \$25. It is elevated on a single oak post a foot square, the turn circle being supported by iron braces. The wings are made of one longitudinal iron bar, through which run small rods; upon these rods, narrow boards half an inch thick are fitted, holes being bored through from edge to edge, and screwed together by nuts on the ends of the rods. This makes strong light sails, but as will be seen fixtures not to be furled or clewed up; but they are thrown up edge to the wind by a very ingenious and simple arrangement of the machinery, which obviates the great objection to windmills for farm use; the necessity of constant supervision of the sails to suit the strength of the wind.

Wind is undoubtedly the cheapest power that a farmer can use, and, notwithstanding its inconstancy, if this improvement operates as well as it bids fair to in the single mill erected, it will be applied to many valuable uses. By windmills swamps may be drained and upland irrigated. What an advantage would be the latter in such a drouth as prevails now in many parts of the country, beside the great amount of fertilizing matter in water at all times. The windmill could be used too for all grinding of grain for farm use, driving the washing-machine and churn, pumping the water from the well or spring—often one of the hardest kinds of labor about the house. Liquid manure, and the solid excrement made of liquid, could be sent a field through leading pipes by the same power.

We earnestly hope for the success of this improvement—that it will not only be an ornament but a thing of usefulness to many American farmers.—*N. Y. Tribune*.

OYSTER-SHELL LIME.

WHILE spending a few hours on Staten Island lately, we saw a simple and efficient mode of making oyster-shell lime, which we record for the benefit of such of our readers as have the opportunity to put it in practice.

Mr. Dunning (for it is upon this gentleman's place the thing is done) builds up with rough stone walls, a circular kiln about five feet in diameter—just as you would stone up a well. A spot is selected on a side hill, where the slope of the ground is such that with a slight excavation the base of the kiln is exposed on the lower side. Here a small opening—a rude archway of 18 or 20 inches wide and a little more in height—is left as a sort of furnace—to be filled with fagots, brush, and stumps of trees, and like rubbish, to be had on most every country place—over this furnace a few bars of iron are built into the wall, to hold up the first layer of oyster-shells.

In filling the kiln, a layer of oyster-shells and a thin layer or sprinkling of the screenings of anthracite coal are put alternately till the kiln is filled to the top—making in all a depth of some 4 to 6 feet. The fire is lighted among the fagots and rough wood below, and gradually spreads through the whole kiln, burning the oyster-shells into excellent lime. When we say that oyster-shells make the purest and best lime for all horticultural purposes, and especially for fruit trees, and in most of our Atlantic towns they are wholly wasted, and though so easily burned in this way in these simple kilns, (which once made will last for a dozen years,) we think we offer a hint, which many subscribers will lose no time in profiting by.—*Horticulturist*.

AGRICULTURAL SCIENCE.

WHAT the schoolmaster is to the child, so is science to Agriculture, and those know it best, and profit most from it, who give it most of their attention. In the language of Judge Cheever, it has taught us the elements constituting a fertile soil, and those of a barren one. It has taught us the elements found in all the fertilizing agents of manures within our reach, whether of mineral, vegetable or animal formation. Hence we are shown what admixtures of soil to make to supply with one the deficiencies of the other. It has taught us what manures to apply to sterility to produce fertility. It has taught us the elements constituting the plants of our agricultural crops. Hence we may determine what crop we may expect most successfully to place upon any given soil, and what manures are best suited to its growth. Science has also taught us the elements constituting the different parts of our domestic animals, from which useful suggestions are obtained for feeding them according to the end to be attained. For instance it is found that our Indian corn contains elements calculated to fatten the animal, but not those that strengthen the muscles so much as those found in our oats. The one, therefore, should be fed for one purpose, and the other for another. This principle has been tested in practice through the agency of the State Agricultural Societies. A pair of oxen of about equal weight and equal vigor, were put at hard work, and one fed upon corn and the other upon oats, of equal weight, daily, for two or three months, and each with a full supply of hay. It was found that the one fed on oats soon got the mastery at the draught over his mate, and maintained it so long as he was so fed. The feed was then reversed for the same length of time. The corn-fed ox when put upon oats immediately recovered his power, and obtained the mastery over his late superior, and maintained it to the end. Science and ex-

periment have here established a fact of vast importance to the farmer in feeding their laboring animals. Still, with hundreds of such experiments and such results before us, there are thousands of farmers who yet regard agricultural science as a humbug.—*Dollar Newspaper*.

VALUABLE STATISTICS ON AGRICULTURE.—It is, I believe, authentic, (coming from one of the oldest, best and most respectable farmers in Delaware, and one whose word can be relied on,) that the first Timothy and Clover seed sown in the United States was sown in Delaware, on the banks of the Brandywine, in the year 1790, and that in the year 1775 a field of some 20 acres was sown in Garlic for hay and pasture, the seed being brought from Germany and sold in this country for \$17 per bushel, and that all grass hay made (at that date) was from a natural blue or green grass grown on the marshes or upland meadows which were fertilized by irrigation. Also a lot of marsh was bought, at that early date, for which was paid \$150 per acre, the same lot was sold a short time ago for \$40 per acre.

The butchers of that date would not buy a bullock that was not fed on marshes, so great was the prejudice of artificial feeding.—*Delaware County Republican*.

A SUBSTITUTE FOR POTATOES.—As the potato crop is even more than usually unpromising this season, the question of a substitute for this invaluable article of daily food becomes of the greatest interest. We observed a paragraph in the newspaper a short time since, proposing the use of the beet. Being lovers of that nutritious and healthy root, we have tried the experiment, and with every prospect of success. Perhaps we are not so fond of potatoes as many who seem to think them indispensable; but to our taste the beet will afford all the gratification, while it furnishes equal nutriment with the potato. The experiment to which we refer is the baking of the beet in the same manner as many people bake their potatoes, in the peel—a mode of cooking which we never knew adopted with the beet and which we very confidently recommend.—*Providence Post*.

MULE TRADE OF BOURBON COUNTY, KY.—Bourbon County, Kentucky, is famous for raising mules. This trade commenced about thirty years ago; since then there has been a steady increase: In 1843, according to the Assessor's Books, there were in the County 1,932 mules, valued at \$41,348, or an average of \$21 31, per head. In 1854, 7,436 valued at \$562,800, or \$75 70 per head. The demand keeps pace with the supply, and sales are readily made. Few are kept on the Kentucky farms for use. The principal markets are the Southern States, where they are used on cotton and sugar plantations. In Virginia they are used on the farm and road. Baltimore furnishes a large market for the smaller animals, where they are shipped to the West Indies, to pack coffee from the mountain plantations. One dealer in Baltimore, purchases annually 1000; and another in Richmond, Va., about double that number, one farmer in Bourbon county sells him every year between 500 and 800. We gather these facts from the Citizen, published at Paris, Ky.—*Ohio Farmer*.

LARGE EGGS.—Mr. D. T. King, of Waterville, Oneida county, N. Y., has sent us a hen's egg that measures 6 3-4 inches by 8 1/2 inches in circumference—weight, 4 1/2 oz. Mr. King writes: "Doubtless the hen was anticipating the end of the world, being laid at the time of the great eclipse of the sun, on the 26th of May, and was endeavoring to fulfill the scripture injunction, what one has to do to do with all his might."

We thought that we had three pretty large eggs, but we own beat by a very little. Ours measure, an average of 7 3-4 by 6 1/2, and all laid by one hen.—*Northern Farmer*.

For the American Agriculturist.

ARTIFICIAL CHICKEN HATCHING.

I ENTERTAIN the idea of attempting to raise chickens by some artificial process, and as I have understood that the business was successfully carried on in portions of our country, I would be obliged to you if you would give me some information on the subject. Perhaps a statement in your valuable paper would be acceptable to your numerous readers, embracing the following:

1st. General arrangement and size of a Hatchery for turning out 200 or 300 chickens.

2d. What degree of heat should be employed, and whether hot air, or steam, &c., or by warm water?

3d. Will eggs brought from a distance hatch well?

4th. The kind of food most suitable, together with any other information relative to the conduct of the business.

GEO. D. PLEASANTS.

*Henrico Co., Va., Aug. 30, 1854.***THE EGYPTIAN GOOSE.**

AMONG the truly ornamental, the Egyptian goose stands first. They are a part of the hieroglyphics of the Egyptians, a favorite article of food for the priests, and their eggs are considered of delicious flavor. They are hardy, and easy to raise; laying seldom over seven eggs at one time. They are very pugnacious over their nest and young, and woe be to the intruder. Three broods can be brought off in one season, by setting their first and second laying of eggs under a hen.

The plumage of the Egyptian Goose is most beautiful; the base of the bill, and the space surrounding the eyes, is a chestnut brown; cheeks, crown, chin and throat, yellowish white. The neck is yellowish brown, paler on the forepart, and on the back reddish brown; the upper part of the back, the breast, and flanks, pale yellowish brown, minutely waved with a darker tint; center of the breast and belly nearly white, with a dark patch (a horse-shoe) of chestnut brown, where these parts may be said to join, vent and under tail coverts buff orange; the lower back, rump, upper tail coverts, and tail, black, wings as far as the greater coverts, pure white, the latter having a deep, black bar near their tip; the scapular or wing feather and tertials, chestnut red, with greyish brown color on the inner webs; secondaries, black at the tips, and with the outer webs, a brilliant, varying green.

They are a rare bird, hard to be obtained, but when obtained, easily kept. Their weight is about twelve pounds the pair. They stand high on the legs, which are of a pink color.

JOHN GILES.

THE "GONE GOOSE."

MESSRS. EDITORS:—In April, 1852, an attack was made on my poultry-yard by dogs, and much of my best stock killed—including Bremen and wild geese, various kinds of wild ducks, prairie hens, &c. This disaster was mentioned in your paper about the time it occurred. In looking over my geese which had escaped the slaughter, I missed a favorite, one of a lot imported by me from Bremen, in 1821. For twenty-nine years she had bred regularly on my place, having laid from twelve to sixteen eggs each year. As she was not to be found after the attack, I feared the dogs had carried her off.—There was, however, a chance that she had been sent by mistake to some one who had purchased geese of me, and I did not fail to make diligent inquiry for her. After more than two years of unavailing search, I have lately had the good fortune to find her, alive and well, and she is now in my yard. She was readily identified by her peculiar looks, and especially by a hole in the outside web of her right foot, which

I made on the 26th of June, 1826. It is about thirty-three years since this goose was imported (how old she was at the time I cannot tell,) but her prolific powers are unimpaired. She laid seventeen eggs and reared a fine brood of goslings this season. One of the goslings was killed in July and weighed thirteen pounds.

SAMUEL JAKUES.

Ten Hills Farm, near Boston, Sept. 1st, 1854.

We have seen the old goose, and four of her last brood, fine large birds, equal to any of the famous Bremen or Embden breed we ever saw.—*Boston Cultivator.*

For the American Agriculturist.

ASPARAGUS AND COW PEAS.

Sodus, Sept. 11th, 1854.

I SEND you a statement of my experiment with the Cow and Asparagus Peas, which you were so kind as to send me last Spring. I planted about the 1st of June. The Asparagus Peas were badly eaten by the bugs, so that but five of them vegetated. They grew finely during the hot dry weather, and produced an abundant crop. The pods were from one to two feet in length—many of them twenty inches. I gathered the first ripe seed from them the middle of August, and they have continued to ripen and grow ever since. There is no difficulty in raising them successfully here.

The Cow Peas all came up and grew finely. They seemed to revel in the drouth. They were planted at the same time as the Asparagus, but ripened the first seed about two weeks later. The last of August, they were growing and bearing, seemingly as fresh as earlier in the season. They are great yielders. There were ripe pods, green ones, and flowers at the same time. I shall obtain seed enough to make other experiments on a larger scale next season. I have not tried their cooking properties, because I had so few, and wished to increase them as rapidly as possible. S. A. COLLINS.

We cultivated the Cow Pea in our own garden with success last year. It is a southern product, and looks very much like our garden beans. There are a great many varieties of them, and at the South they grow with great luxuriance.

MARROW SQUASH.

This delicious vegetable is grown in great abundance on the fertile fields of Marblehead. While the crops in other places are cut off by the bug on the leaf, or the Maggot at the root, there it would seem, the plants find no obstacle in the way of going ahead.

Perhaps it may interest some to know how this is brought about. As I passed the field of Mr. Hathaway, situate on the right-hand side of the road as you go from Lynn to Marblehead, I saw more than two acres covered with squashes, as luxuriant as though no drouth had prevailed. On inquiry of the proprietor, I learned that the sod was turned in the spring, and pulverized with a fair coating of compost thereon, and the seeds were planted in hills eight feet apart, leaving three plants in a hill. Now the ground is covered with an abundance of squashes, varying in size from three to ten pounds each, estimated to exceed ten tons to the acre, commanding in the market \$35 a ton—amounting to \$300 an acre. This was not the only field that I saw; others of like character are to be seen. On the ground of Mr. Washburn, Mr. Mason, Mr. Howe, Mr. Stone and Mr. Brower, and others in the neighborhood—though not so abundant. Whether those crops are brought about by a peculiarity in the soil—or in the manure applied, or in the vigilance with which they are tended—there they are to be seen by any one who will look at them.—P., in *New-England Farmer*.

THE Ohio State Fair has been postponed till the 17th of October.

CURRANT TREES.

HAVING noticed that currant bushes may as well be made trees as shrubs, I conclude to tell you how I have seen it done. In the spring of 1831 my father commenced a garden, and among other things set cuttings for currant bushes. I determined to experiment on one of those cuttings; and as soon as it grew, I pinched off all the leaves except the top tuft, which I let grow. The cutting was about fourteen inches long, and during the summer the sprout from this grew ten inches.

The next spring I pinched off all the leaves to about half way up to the first year's growth, so as to leave the lowest limbs two feet from the ground. It branched well and became a handsome little dwarf tree. When it came to bear fruit, it was more productive than any other bush in the garden and the fruit larger.

It was less infested with spiders and other insects; hens could not pick off the fruit, and grass and weeds were more easily kept from the roots, and was an ornament instead of a blemish. Now I would propose that currant cuttings be set in rows about four or five feet apart each way, (let them be long and straight ones,) and trained into trees.—*Michigan Farmer*.

TOMATOES.—We were recently in a garden in this city where were some twenty or thirty tomato vines—all but two had been trained up to lattice-work, some standing in the garden without any other support and some standing near a fence. The branches had been so carefully tied up, that scarcely one had been allowed to reach the ground, the vines growing some six or seven feet high when their tops had been cut off and trimmed. The fruit on these vines was abundant, though not very large, and in nearly every instance it was fair and smooth as an apple. The two vines which had been allowed to have their own way, kept pretty close to the ground, and were as crooked as they well could be, but the fruit on them was nearly, if not quite, twice the average size of the fruit on the vines which had been trained, and the largest tomato lay on the ground, almost entirely excluded from light and air. While the fruit on the vines which had been trained was smooth, that on these was pretty much the shape of the vines—very crooked and ill shapen.—*Hartford Courant*.

HOW TO GET THE REAL FLAVOR OF COFFEE.—In Knighten's "Foreign Life in Ceylon," are the following hints on the preparation of coffee, derived from long experience:

The subtle aroma which resides in the essential oil of the coffee berry, is gradually dissipated after roasting, and of course still more after being ground. In order to enjoy the full flavor in perfection, the berry should pass at once from the roasting pan to the mill and thence to the coffee-pot, and again after having been made, should be mixed when almost at boiling heat, with the hot milk. It must be very bad coffee indeed, which, if these precautions be taken, will not afford an agreeable and exhilarating drink.

CATCHING FLIES.—The *Prairie Farmer* tells how they catch flies in England. It is done by "fly papers," and the process is called "fly-torture," on account of the manner in which the insects have their feet fastened in the "stocks." The article used is rosin and sweet oil mixed, and spread over the surface of a newspaper, then slightly sprinkled with sugar dust. The moment the fly puts down his foot he is fast. They are thus caught with great rapidity. The "torture" appears to consist in a want of liberty to go where they please.

ROBERT HALL said of family prayers, It serves as an edge and border to preserve the web of life from unraveling.

Horticultural Department.

HORTICULTURAL SOCIETY OF BROOKLYN, N. Y.—FALL EXHIBITION.

THE announcement in our last issue, of the opening of this exhibition, was not full enough to convey an idea of the extent of the arrangements made by this promising Society, to create and insure a taste for the too much neglected science of horticulture, in the vicinity of the largest and most influential city of the Union. What New-York cannot do for herself, the citizens of New-York and Brooklyn may do when united, and there can be no doubt but that, by judicious management, many years will not elapse before the reproach hitherto so justly thrown out upon us, that we neglect this softening and civilizing source of enjoyment, may be wiped off.

The Brooklyn Society, not yet twelve months established, has had its third exhibition on an extensive scale. If the liberal support of the citizens, whose refinement and intelligence should induce the Society to depend upon their patronage in so laudable an enterprise, do not come forward in numbers sufficient to place it beyond embarrassment, the fault is with them. The Society has done its duty. In addition to the objects of interest produced and displayed by the members and gardeners of the neighborhood, arrangements had been made to bring from other localities, many novelties of interest and attraction. CALEB COPE, Esq., of Philadelphia, whose interest in the science has not been surpassed by any American amateur, furnished a plant, with leaves and flowers, of the Victoria Regia, and Nelumbium Speciosum, which latter has not been before exhibited in this State. It is a very beautiful aquatic plant, with *peltate* leaves and large pink flowers, resembling in size and form, a large Tree Peony flower. It was grown in the open air, in a pond in his garden, but it does not mature its seeds. The leaves of the Victoria Lily were in perfect condition. The flower was beyond its most attractive stage, as it had been in perfection one day before the opening of the exhibition. A choice and rare collection of Exotic Ferns were contributed with the greatest kindness by JAMES DUNDAS, Esq., of Philadelphia, and were forwarded promptly, with the Lily, and other objects, by the special favor of WM. H. GATZMER, Esq., Superintendent of Camden and Amboy railroad.

Perhaps the next most attractive item was a miniature garden, or model landscape, laid out by H. A. GRAEF, of Brooklyn. It represented an entire villa, with its lawn, gravel walk, shrubbery, and flower beds, planted judiciously, with neat little herbaceous and other plants, the whole presenting an entire and completely arranged country villa. We cannot enumerate the plants which were to be seen growing in this model garden, or attempt to describe it as it appeared to the pleased visitors. The lawns were formed of velvety moss, and the trees were imitated by *dendroid* mosses, Lycopodiums, and other such dwarf vegetables. The bouquets and baskets were very choice and neatly arranged. The plants were of greater novelty and merit, and perhaps of more value pecuniarily than any collection we have seen brought out for some time. The principal contributors

were J. H. PRENTICE'S gardener, MARTIN COLLOPY, whose table was furnished with many very rare exotics. A very fine tea-plant was much admired, being very healthy and robust. *Pitcairnia punicea* was a very rare and choice plant, also a very curious climbing plant, called *Dictyanthus pavonica*, with peculiarly formed dusky-colored flowers, which belongs to the Asclepias tribe. His plant of *Cissus discolor*, now for the second time exhibited, attracted general attention, and obtained the first premium.

L. MENAND'S collection was, as usual, select and valuable. A standard Heliotrope, grown to a height of three feet with spreading head, was the most skilfully cultivated plant in the room. His heaths, ferns, and orchids were much admired. A pretty air plant, called *catasetum globbiflorum*, was exhibited from the city conservatory of MRS. HOLBROOK, Union Place, gardener, DAVID SCOTT. It has a peculiarly formed flower, and was attached to a small block of wood, on which it appears to grow and bloom luxuriantly.

The display of variegated exotic plants deposited by J. E. RAUCH, of Brooklyn, was a very important feature, and evidenced great skill in plant culture. These are very properly styled *leaf* plants by German gardeners, their beauty being commonly centered in their foliage.

A. P. CUMMINGS, Esq., of Williamsburg, gardener to MATHIAS COLEMAN, exhibited for display, a collection of large, choice hot, and greenhouse plants.

But the most important part of the affair was the fruit department. A more extensive assortment of perfect exotic grapes, we have not seen at any previous exhibition. We may on a future occasion take pains to particularize the various contributions in this branch of the exhibition.

A small bunch of very well colored grapes, we ascertained by a card, to be the *Graham* grape of Philadelphia, a seedling from the Bland and Isabella, but of finer flavor and better quality than either of these. It is named after the person who raised it, Mr. Graham, gardener to the Guardians of the Poor, Blackley Almshouse. He has held that responsible position for many years, and produced several novelties.

The fruits from Massachusetts we cannot now attempt to particularize. A splendid assortment of thirty-five varieties of pears were presented by A. J. S. DEGRAUW, by the favor of W. E. French, Esq., of Boston, also twenty varieties of apples. The other contributors were Ellwanger & Barry, Rochester, N. Y., who had some splendid specimens. B. V. French, of Braintree, Mass., Messrs. Hovey & Co., and N. Stetson, Esq., had some very choice fruit, also the Messrs. Burr, of Hingham. George Hamlyn obtained the premiums for the best display of fruit. Annexed is the list of premiums awarded by the judges.

GRAPES.

1st Prem., 6 bunches, H. H. Grapes, to Geo. Hamlyn, gardener to Wm. C. Langley, Esq., Bay Ridge, L. I.,	\$6 00
Second do. to David Hunter, gardener to R. Rennie, Esq., Lodi, N. J.,	4 00
First 3 bunches, H. H. Grapes, to R. Morrison, gardener to R. M. Blackwell, Esq.,	3 00
Second do., to Chas. Ingram, gardener to M. Morgan, Staten Island,	2 00
First 2 bunches white grapes to R. Morrison,	3 00

First 6 bunches Isabella grapes to Maurice Quinlan, gardener to Judge King, Brooklyn, L. I.,	3 00
Second 6 do., to Martin Collopy, gardener to J. H. Prentice, Esq., Brooklyn,	
First best 6 bunches Catawba, to the same,	3 00

PEARS.

Best display of Pears to Hovey & Co.,	7 00
Best 6 varieties do., to N. Stetson, Esq., Bridgewater, Mass.,	3 00
Second best do., Hovey & Co., Boston,	2 00
Best dish of Pears, N. Stetson, Esq.,	1 00

PEACHES.

Best dish of Peaches, N. Stetson, Esq.,	2 00
Second best dish of Peaches M. Collopy,	1 00

QUINCES.

Best 12 Quinces, D. Murphy, gardener to J. T. Stranahan, Esq.,	2 00
Best dish of Figs, James Brown, gardener to F. A. Griffin, Esq.,	

MELONS.

First 2 watermelons to Chas. Ingram,	2 00
Second do., H. Tanner,	
Best 3 muskmelons to H. Tanner,	2 00
Second do., do., to R. Morrison,	1 00
Best general display of fruit to Geo. Hamlyn.	

PLANTS IN POTS.

Best display to M. Collopy,	8 00
Second do., to L. Menand, Albany,	5 00
Best 3 specimens to L. Menand,	3 00
Best single specimen to M. Collopy, (for <i>cissus discolor</i> .)	
Best 4 fuschias to W. Poynter,	3 00
Best 3 achimenes to Chas. Ingram,	2 00
Best 2 specimens of orchids to L. Menand,	3 00
Best collection of ferns to L. Menand,	2 00
Special Premium for display of plants to J. E. Rauch, Brooklyn,	3 00
Best display of roses (cut) to Wm. A. Burgess,	3 00
Second do., J. E. Rauch,	2 00
Best 12 roses to G. Marc,	2 00
Second best do., to James Weir,	1 00

DAHLIAS.

Best display, Hovey & Co.,	5 00
Best 12 self-colored do., to Jas. Weir,	3 00
Second do. do., to E. Zepplin,	2 00
Best 12 fancy do., to Jas. Weir,	3 00
Second best do., to E. Zepplin,	2 00
Special premium 4 seedling dahlias to L. Menand.	

CUT FLOWERS.

Best general display, to Jas. Weir,	4 00
Best pair hand bouquets, to W. & J. Park, Brooklyn,	
Second best, R. Reid,	3 00
Best parlor bouquet, to Jas. Weir,	2 00
Second best parlor bouquet, to Wm. Cranstons, gardener to J. E. Stevens, Esq., Hoboken, N. J.,	3 00
Best basket of flowers, W. & J. Park,	2 00
Second best basket, W. Poynter,	2 00
Best basket of wild flowers, H. Tanner,	3 00
Best ornamental design, H. A. Graef,	5 00

VEGETABLES.

Best collection potatoes, C. Ingram,	3 00
Best dish potatoes, H. Tanner,	1 00
Best 6 blood beets, C. Ingram,	1 00
Best 12 carrots, R. Morrison,	1 00
Best 6 parsnips,	1 00
Best 12 salsafy, H. Tanner,	1 00
Best 12 turnips, R. Morrison,	1 00
Best 2 egg plants, C. Ingram,	1 00
Best half peck tomatoes, J. Weir,	1 00
Best half peck Lima beans, C. Ingram,	1 00
Best 3 heads Savoy cabbage, R. Morrison,	1 00
Best 3 heads white cabbage, H. Tanner,	1 00
Best 6 heads celery, R. Morrison,	2 00
Second best do., H. Tanner,	1 00
Largest and best display of vegetables, H. Tanner,	5 00
Best 12 white onions, H. Tanner,	1 00
Special premiums for roses in pots, Geo. Ingram, Greenwood,	3 00

American Agriculturist.

New-York, Wednesday, September 27, 1854.

TALK ABOUT NEW-YORK CITY, AND THE GREAT AGRICULTURAL SHOW.

WITH A MAP OF THE CITY.

Minute Directions to Strangers as to Points of Arrival—Conveyances in the City, with regular fares—Omnibusses—City Rail-Roads—Carriages—Baggage Expresses—How to get to the Show Grounds—European, and other Hotels—Boarding-Houses—How to visit the Crystal Palace, Greenwood Cemetery, Navy Yard, &c., &c.

On the opposite page we have given a condensed map of the business portion of New-York City. A study of this would be interesting at any time, for there are more people on the small plot represented by this map, than there are in each of half of the smaller States in the Union. Indeed, leave out the States of New-York, Pennsylvania, Ohio, Virginia, Tennessee, Massachusetts, Indiana, Kentucky, Georgia, North Carolina and Illinois, and there is no state to compete, as to the number of inhabitants, with this little plot of ground two by four miles. But we give this map, and a few directions, now chiefly with reference to the great Agricultural Show, which commences here on Tuesday next, (Oct. 3.) In a former number (vol. XII, page 218,) we gave some directions to "Green visitors in New-York," and to save repetition we advise those who are "green" to turn back and read them before coming to the Show.

In New-York most of the streets have their names posted upon each corner, so that a stranger need be in no fear of losing the name of the street; for he is generally in sight of a guide-board. Now by taking a map in his hand he can trace out his course to almost any point he may desire.

Before describing the map, we wish every reader to mark particularly the reference spaces or squares. Across the map from left to right are spaces divided off by horizontal lines. These spaces are numbered with figures 1, 2, 3, &c., or 1*, 2*, 3*, &c. There are other divisions extending from the top to the bottom of the map. These are marked with the letters of the alphabet, A, B, C, &c. Now it is easy to point out any place on the map by simply giving the figure for the cross divisions, and the letter for the perpendicular divisions. Thus 5.E, points out the square where the 5th division or row of squares crosses the E division. Looking for 5. E, you will find Washington Square marked on the map. In the square 10.C, you will see the word "PARK" written. 3*.H, points out the Crystal Palace; 12.D, the location of the *American Agriculturist* office; 13.A, the Battery, &c. In another place we give an alphabetical list of some of the principal points of interest, including hotels, &c.

GENERAL DESCRIPTION OF THE CITY.—New-York is situated on an island about 14 miles long, formed by the Hudson river on the west, the East river (an extension of Long Island Sound) on the east, and the Harlem river on the north. About 4½ miles in length of the South-

ern part of the island are represented on the map. As will be seen, the Hudson and East rivers run together at the Southern extremity, forming the New-York Bay, which reaches out to the ocean at Sandy Hook, some 20 miles from the Battery or lower end of the city. The northern half of the island is narrow, somewhat hilly, and in several places is covered with rocks and trees. From the line of squares marked 3* to the Battery, (13.A,) there is a dense mass of buildings, broken only by streets and an occasional public square, or a vacant lot. The arrow upon the left of the map (in 2.A) points to the north, and will show the direction of the streets. It will be seen that Broadway runs nearly from southwest to northeast, between the Battery and Fourth street, which is a distance of 2½ miles.

POINTS OF ARRIVAL IN THE CITY.—Those coming by the Camden and Amboy, and by the New-Jersey Central railroads, land at the piers just west of the Battery, 13.A.

Those from the New-Jersey, the Morristown, and the Patterson railroads, land near the foot of Courtlandt street, 11.A.

Those coming by the Hudson River boats, land at different points in 11.A, 10.A, and 9.A.

Those from the Erie railroad, land at the foot of Duane street, 9.A.

Those by the Hudson River railroad leave the cars in Chamber street, near the southeast corner of the square 9.B. They can also leave the cars at the corner of 31st street and 11th avenue in 3*.C.

Those coming by the Harlem railroad, leave the cars at the northeast corner of the Park, 10. D, or at 27th street in the 4th avenue, 1.H. They can also leave at several points between. During the Show, passengers by the Harlem road can leave the cars at 66th street, within a few feet of the Show Grounds.

Those coming by the New-York and New-Haven railroad, leave the cars at the corner of Canal street and Broadway, 8.D. They can also leave at 32d street in 4th avenue, in the lower right hand corner of 1*.H.

Those coming by the New-Haven or Connecticut river steamboats, land at the foot of Peck Slip, 12.E. The 2d avenue railroad will take them from this point to 66th street, within one square of the Show Grounds.

Those coming by the Long Island railroad, leave the cars in Brooklyn, at the ferry, which takes them over to the east side of the Battery, about the center of 14.B.

Passengers by steamboat from Norwich, Stonington, and Fall River, are landed on the west side of the city, in 12.A.

We have given the landing places of passengers from the routes from a distance. There are a large number of local steamboats, but those coming by these are generally acquainted with the city.

With the above directions, and by referring to the guide upon the margin of the map, strangers can usually find their way to any part of the city. We will, however, describe some of the

BAGGAGE EXPRESSES.—On most of the railroads a baggage express agent passes through the cars before they reach the city, and takes the baggage checks from such passengers as desire. If you give him your check he will deliver your baggage any where in the city, charging

25 cents for each trunk or bundle. After giving him your check you need take no further trouble about your baggage, but to look for it in the course of an hour or so at the place you have directed it to be sent. None but reliable men are admitted upon the cars on this business.

MEANS OF CONVEYANCE WITHIN THE CITY.—There are two principal starting points from which a person can take a public conveyance to almost any part of the city. These are the South Ferry just east of the Battery, 14.B, and the lower end of the Park, 11.C.

OMNIBUSSES.—From the South Ferry, lines of omnibusses start up Broadway, Bowery, and the different Avenues, (which are wide, straight streets, running in a north and south direction through the entire upper part of the city. They begin with 1st Avenue near the east side, and number to the west, where we see the Tenth Avenue beginning in 2.B.) The route of each omnibus is plainly written upon the outside. The fare is six cents for any distance, long or short, within the city, to be paid to the driver before leaving the omnibus. Two or three lines charge less than six cents; these have the rates, 3 or 4 cents, put upon a card always plainly to be seen. The omnibusses take up and set down passengers at any point on their route, which they never leave. There are several lines of omnibusses starting from Fulton Ferry, 12.D, and from other points.

CARRIAGES OTHER THAN OMNIBUSSES.—At every landing place there are always a number of carriages, which will take you to any point in the city. The charge on these fixed by law is, for one passenger, one mile or less, 50 cents; for two passengers 75c., and 37½ for each additional passenger. For more than one mile and less than two, the charge is 75c. for one passenger, and 37½c. for each additional person. Each passenger is entitled to carry one trunk or valise, and the charge is 6c. for each additional piece. It is usually better to arrange the price before entering one of these carriages.

CITY RAILROADS.—There are five railroads running north and south through the city. The cars are drawn by horses, and they take and leave passengers any where on their route. The fare in these cars is five cents for any distance within the city.

2d Avenue Railroad.—This commences at Peck Slip, 12.E, (at the line marked in the map E, R, S, B) and extends through Pearl and Chatham streets, through the Bowery to Grand street, (in upper part of 9.F,) thence a short distance east through Grand street to Allen street, up Allen and 1st Avenue to 20th street, then into 2d Avenue and up 2d Avenue to Yorkville, about 86th street. These cars pass within one block of the Show Grounds, on 66th street.

3d Avenue Railroad.—This extends from the lower end of the Park, 11.C, through Chatham street, up Bowery, into 3d Avenue, at 6.F, and up this avenue to 86th street. These cars pass along the east side of the Show Grounds.

4th Avenue Railroad.—This also begins at the lower end of the Park, 11.C, and extends up center street to Broome, 8.E, through Broome into Bowery, up Bowery to Union Square or Place, 3.G, and thence up 4th Avenue to 27th street, in 1.H. The horse cars do not go farther

Entered, according to Act of Congress, in the year 1848, by HOLBROOK AND BARRETT, in the Clerk's Office of the District Court of the Southern District of New York.

up, but during the Show, persons can take the long cars on the track at the northeast corner of the Park, and be landed at the Show Grounds. These long cars are drawn by steam above 27th street, and the fare will probably be a trifle higher than in the horse cars on the other roads. It will not exceed $12\frac{1}{2}$ cents.

6th Avenue Railroad.—This road has two lower branches, one leading from the corner of Canal street and Broadway, in 8.D, and the other from Barclay street, just west of the Park, 10.B. The two branches meet in Canal street, and the track continues through several short streets till it enters the Sixth Avenue, in 5.D,

and up this to the Crystal Palace in 3*.H, which is as far up as the cars yet run on this road.

8th Avenue Railroad.—The cars on this road (which are painted red) start at the same point and run over the same track as the (white) Sixth Avenue cars, but branch off to the west and go up through the 8th Avenue, which begins in 2.D.

To REACH THE SHOW GROUNDS from any landing place, it is only necessary to strike somewhere upon the track of second, or third Avenue railroads, or the long cars standing upon the 4th Avenue at the northeast corner of the Park. From most landing points it will be best to go directly to the Park. A number of the hotels are near the Park, and as before stated, the 3d and 4th Avenue railroad cars leave this point. By going a little way up Chatham street to Pearl street, (in the lower right hand corner of 10.D,) you can take the 2d Avenue cars.

HOTELS, EATING HOUSES AND BOARDING PLACES.—Upon the side of the map we have given the names and locations of some of the principal Hotels. There are, however, a great number of others not there named. You will find plenty of "runners" who will with great vehemence urge the claims of this and that hotel, but it is safer to *pay no attention* to any of these, for, ten to one, the most miserable liquor shops will have the most vociferous "runners."

At the *European Hotels* you can secure a room for a day or week, for which the usual charge is 50 cents per day. Connected with these is an eating house, where you can get whatever you like, paying a small sum for each article called for. The price is always given on a printed "bill of fare" which lies upon each table. In this way you can get a plate of steak including potatoes and bread, for 6 or 12 cents, a cup of tea or coffee for 3 or 6 cents, and other articles at a proportional rate. Most of these Hotels are designed for gentlemen only. You can take ladies with you to Savery's Temperance House, which is on Beekman street, adjoining the office of the New-York Times. On the map you will find its location near the center of 11.C, just above the word "Ann." The Eagle Hotel is only kept as a lodging house, containing a great number of small rooms, which are let for 25 to 50 cents per night.

The other Hotels not included in the European, charge so much per day for rooms and meals; usually no deduction is made for absence from meals. The Astor House, St. Nicholas, Metropolitan, New-York, and Prescott Hotels, charge \$2.50 per day we believe. The others charge \$2—some of them less.

Very good meals or lunches can be obtained cheaply at numerous eating houses, where a printed "bill of fare" gives you the price of any dish you may desire to call for.

There are a great number of *Boarding Houses* all over the city, where you can get lodging and board for 75 cents to \$1.25 a day. For the locations of these we must refer you to the advertising columns of the different newspapers.

CRYSTAL PALACE.—You will of course visit this one day at least. It can be reached by the Sixth Avenue railroad for 5 cents, and by omnibuses from every part of the city, for 6 cents. All lines of omnibuses running to the Palace are so marked, and you have only to get into one of them going north, and state to the driver where you wish to be left.

OTHER PLACES OF INTEREST.—While in the city you may wish to visit other places of interest, besides the Show and Crystal Palace. We have marked the location of several of

these on the margin of the map, and you can easily find them without farther directions.

GREENWOOD CEMETERY.—To reach this, cross Fulton Ferry, 12.D, for 2 cents, and you will find at the Brooklyn landing, (13.F,) a car marked "Greenwood Cemetery via Court street." Step into this and you will be taken to the gate of the Cemetery, 4 miles distant, for 4 cents. This is a pleasant trip which takes you through the south part of Brooklyn, and along the New-York Bay. Before starting, however, go to the cemetery office, No. 53 Broadway, (12.B,) or call upon any undertaker, and you can get a *free ticket* of admission to the grounds. Many strangers neglect this, and lose their journey to Greenwood. The precaution of requiring tickets is necessary to keep out gangs of loafers and rowdies.

NAVY YARD, 13, 14.J.—This will well repay a visit, and is always open to visitors. To reach it cross the Fulton Ferry, and take a car running through "Sands street," and the Conductor will direct you to the Navy Yards. Public works being the property of the citizens, are generally open to the inspection of the owners.

DOWN THE BAY.—Every one having two hours of spare time, should go down to the east end of the Battery, 14.B, and take a trip on the Staten Island steamboat. This will give a five miles' sail down the bay, and one which it is well worth while to make. The fare is only 6 cents each way. You can go and return on the same boat. We have not room for further particulars this week.

MONUMENT MOUNTAIN.

The following extract is from a private letter from a boy, and although not designed at all for publication, we think it worthy of the type.

LENOX, Mass., Sept. 6, 1854.

Among the many days so pleasantly passed by us in our sojourn in "Beautiful Berkshire," none, I think, will be looked back to with greater pleasure, or thought of with more delight, than our yesterday's visit to the far-famed Monument Mountain.

By nine in the morning our lunch was ready, the horses had come, and we were all packed away for our drive. The fog and mist that hung around us, obscured much of the fine scenery just about the village; but also kept off the rays of the sun for a short time, till we reached the "Bowl," (Stockbridge Lake.) It was then that "old Sol" burst out with all his heat, and kept us comfortably warm for the rest of our ride.

No one that has not passed over the Lake road to Stockbridge in the early morning, can appreciate the beauties from a description, or can form a just idea of the drive. The broad, level meadows stretching away to the Ponds, the little bubbling brooks, the tall forests of pine, chestnut and maple, the lovely lake itself, sparkling in the sun, gently ruffled by the breeze, or calm and still on its glassy surface, the sandy beach, and the picturesque farm-houses scattered here and there, with their little clusters of buildings, fast being filled with the harvest, must be all seen to be really admired, and then, how beautiful they are.

Our route not lying through Stockbridge, we missed one view, which in every respect, far surpasses all others in the road to the mountain. Seen from the hill-top overlooking the village, with the fantastic shadows playing on the sides and at the base of the distant Taghconic, with the Housatonic rolling in graceful curves, the pretty little town at our feet with the lofty hills towering just above—in itself far exceeding Lenox as a place for summer residence; all combine to

form a scene to which there is no superior, and hardly an equal in the region around. But the road we did follow, leading us along by the winding river, shallow now and rocky from the drouth, with a hill rising above our heads on the right, did not induce any to regret the course our leader had chosen. A factory, and the desire to visit it on the part of some of the party, called us aside for a short time, but glad to escape the buzz and hum of the machinery, we reentered our carriages, and were off for the Furnace.

'Twas rather an unfortunate selection some may think for a warm day, but in reality a very cool place, if one would only make it so. The river on one hand, a stream of water playing on the other, and a blast of cold air in the center, strong enough to move a seventy-four gun ship, made us comfortable, but yet we were happy to be away. Having filled our jug with nothing stronger than spring water, our foaming horses drew us up a road constructed under the most unfavorable circumstances, through pastures and over rocks, rails, and underbrush, till finally an end was put to our progress by a huge hemlock across the path, and the weary party rested themselves under the trees on chestnut burrs; the ladies meanwhile preparing the repast on the ground, having selected (I should say) the thickest of the brambles and briars,—a most unaccountable taste, truly. Dinner despatched, we started by detachments for the top, all arriving there in safety, but much fatigued, very warm, and little fitted for enjoying the beauties of the scene.

A rest of an hour under the shade of the cool rocks, rendered me capable of walking around and examining the face of the rocks above, and the face of nature below, both of which fully equalled my expectations. Luckily for me I was there long before our leader made his appearance, and I had a fine view from the highest point of the precipice. The dense mass of shadow on the thick forest below, and beyond the bright sunlight spreading over fertile meadows, seen from such an elevation, was picturesque in the extreme. The meadows and corn-fields stretching away for miles, often interrupted by little wooded elevations, sometimes by hills, the large trees scattered here and there, looking in the far distance like bushes, the ponds and lakes, few though they were, the roads seeming more like foot-paths than well-travelled highways, and the cottages embowered in shrubbery, make it well worth the effort of ascending the toilsome summits, and incurring the danger, whatever it may be. Towards the west the prospect is more confined, and not so beautiful. The large lake seen away in the distance high up among the hills, shining like silver, and the gradual ascent of a mountain in front, densely wooded to its summit, are the principal features of the scene. The rustling of the wind in the branches and the occasional voice of a bird or chatter of a squirrel, are the only sounds on this elevated point.

What a contrast does this view now present to the one seen by the Indian hunter, before the land was covered with the waving fields and the stately houses of the white man! The hills, the mountains, the plains, and the valleys—the brooks and lakes are the same, but by what different circumstances are they surrounded. He viewed them covered with forest trees, and abounding in game, we see them occupied by the husbandman, and herds of grazing cattle. How many whites were there then; How many red men now!

A walk, almost as wearisome as the ascent, soon brought us to our horses; and when fairly scated and ready for home, we were not long in reaching Lenox, tired, but pleased with our day.

R. H. A.

THE sum of \$1,600 has been contributed for a monument to the late A. J. Downing. The commemorative shaft will be erected in the public grounds at Washington, which were laid out under Mr. Downing's direction.

Scrap-Book.

"A little humor, now and then,
Is relished by the best of men."

TAKING CARE OF THE BABIES.

WE hazard little in saying that there are many farmers who take much greater care of their domestic animals than they do of their own offspring. You will see their calves carefully watched, and every pains taken to give them a good start in the world, and secure good constitutions, while their children are allowed to "come up," or at best, they are given over to the tender mercies of some antiquated "nurse," who has a routine of whims as her guide-book in the management of children. We have for some time desired to take up this subject systematically, and have been reading to that end. We find in the last number of the Country Gentleman an article from a New-York Physician, which so nearly meets our views, that we gladly transfer it to our columns.

At this season of the year, when the weekly bills of mortality are calling attention to the alarming proportion of deaths of children under five years of age, our attention is naturally turned to their management, and it may be that some suggestions on this topic may be of interest to the public. If the loss were as great in any other branch of stock-raising, we should have inquired into the matter, and we should have ascertained certain general principles of management; but because children are endowed with incipient reasoning faculties, we seem to forget that they are animals, and as such amenable to physiological laws.

The source of by far the greatest amount of trouble during the first six months after birth, is *undue officiousness*—the desire to do something for the baby. If Providence has sent you such a stranger, don't kill it with kindness.

Don't feed the baby. No—not even a teaspoonful of cold water. If you must feed it any thing, this will do it the least hurt. But let it alone. It will nestle about and cry a little when it gets hungry. Perhaps it will be twelve hours first. What then? It won't starve.—When it manifests uneasiness let it "go to work at its trade." When a child cries, it means that it is in pain. They are never cross, unless made so by mismanagement. Healthy children are always good-natured. Don't keep a little dish of cracker and water on the stove, for it is as impossible to raise fine nurslings on any kind of pap, as it is to raise fine calves on hay tea. If you feed them *any thing* of the sort, it is as indigestible to them as sawdust, and of course they have a turn of colicky pain, and cry; and of course you give them elder-blow tea, or poeny-root tea, or soot tea, or anise-seed tea, and when this proves insufficient, you resort to paregoric, which binds up their bowels, and then you resort to castor-oil, and continue at the same time the cracker, until you find it necessary to resort to the doctor. If you live at a distance from a physician, or your husband thinks it not worth while to call one, you continue in this way, raising a scrawny, cross baby, that, as you say, "torments the life out of you," who, whatever his property expectations may be, is certainly entitled to a dyspepsia in reversion. But if from any chance the child must be fed—if the natural supply of nutriment is absent—I do not even say deficient, (for experience proves that the reasons must be very grave to justify a resort to artificial feeding) and a wet-nurse cannot be procured—the best practical substitute previous to the appearance of the first teeth, is new cow's milk, from half to two-thirds water, and sweetened with loaf

sugar. If the child throws it up, it is too strong of the milk or sugar, and must be further reduced with water. Brown sugar, or even molasses, may be used as a laxative, if they do not occasion pain, and the milk should be boiled. Even with the best of care it is a serious matter to raise a child "by hand." The mother's milk contains just the elements, and in just the right proportions, for the composition of the child, and there is nothing else that quite does.

As the period approaches at which the first teeth are to appear, the child "drools," and manifests a desire to put things into its mouth. This is not hunger, and it is entirely unnecessary to tie up a little bread and sugar in a rag, as is commonly done, and give it to suck. Indeed, all such supplementary food is injurious at any period of life, and the child should nurse or be fed at regular periods, these periods being more frequent as the child is younger. This itching of the gums is relieved by giving it some hard, smooth substance, as a cord, ring, or a silver dollar, to chew. The child will take any thing that it can into its mouth, and even swallow it, and mothers are apt to interpret this disposition into an appetite for the food of adults. Some of them have a way of cramming their children with food that they have masticated, plainly saying, that they would have had them born with teeth. As yet the child has but little smell or taste, and is of course disposed to swallow every thing that goes into its mouth.

The stomach, too, has begun to lose that peculiarity of form, by which it emptied almost as readily as from a tea-cup, whatever disturbed it, and these offensive matters begin to go off the "other way," forming most untractable bowel complaints.

The diet of the mother is a very important matter. Meat should not be eaten more than once a day, and with ladies who are not taking much exercise in the open air, even this is scarcely allowable. Spirituous liquors, although they increase the amount of its secretion, vitiate its quality, and may even produce cholera infantum with the child. A dinner of beefsteak will probably be followed by a cross fit with the baby. And generally speaking, the diet of nursing women is too high in quality. Entertaining these principles, it will not be expected that we should stop here to bestow any remark on those women that delegate this kind of care to a wet nurse, or even resort to artificial feeding in order to bestow their time on balls and routs.

WHAT IT COST TO STOP THE PAPER.—One of our subscribers stopped his paper for six months last year, because we advertised so much. It the mean time his farm was advertised for non-payment of taxes, and sold. On discovering the difficulty, it cost him one or two days' travel with horse and buggy, and ten per cent. of the taxes—to say nothing of the vexation, to redeem it. How much did he gain by stopping his paper? He came back and subscribed again.—*Ogdensburgh Sentinel.*

EFFECT OF CLEANLINESS.—Count Rumford, the celebrated practical philosopher, whose writings have been of greater value to mankind than the abstruse speculations of a host of metaphysicians, thus described the advantages of cleanliness:

"With what care and attention do the feathered race wash themselves and put their plumage in order; and how perfectly neat, clean and elegant do they ever appear. Among the beasts of the field, we find that those which are the most cleanly, are generally the most gay and cheerful; or are distinguished by a certain air of tranquility and contentment; and singing birds are always remarkable for the neatness of their plumage. So great is the effect of cleanliness upon man, that it extends even to his moral character. Virtue never dwelt long with filth; nor do I believe there ever was a person scrupulously attentive to cleanliness, who was a consummate villain."

FROM THE LOUISVILLE JOURNAL.

This is one of the most pleasant and ingenious things we ever saw. We think we admire the pyramid more in ascending than in descending it:

THE PYRAMID.

BY G. S. PERCIVAL.

[To be read ascendingly, descendingly and
condescendingly.]

! There
For aye
Commanding,
! 'Tis standing,
With godlike air
Sublimely fair!
Its fame desiring
Its height admiring,
Looks on it from afar
Lo! every smiling star,
To raise the pile to Heaven
These beauteous stones are given.
Each pray'r for truth's inspiring light,
Each manly struggle for the right,
Each aspiration for the holy,
Each kindly word to cheer the lowly,
Each strong temptation nobly overcome,
Each clamorous passion held in silence dumb,
As slow it riseth towards the upper Heaven,
Stone after stone unto the mass is given,
Its base upon the earth its apex is the skies,
The good man's character a pyramid doth rise

RUB OR RUST.

BY EBENEZER ELLIOT.

IDLER, why lie down to die?
Better rub than rust.
Hark! the lark sings in the sky—
"Die when die thou must!
Day is waking, leaves are shaking,
Better rub than rust."
In the grave there's sleep enough—
Better rub than rust.
Death perhaps is hunger-proof,
Die when die thou must;
Men are mowing, breezes blowing,
Better rub than rust.
He who will not work, shall want;
Naught for naught is just—
Won't do, must do, when he can't—
Better rub than rust.
Bees are flying, sloth is dying,
Better rub than rust.

CONSCIENCE.—Bishop Taylor has this striking image: Conscience is a clock, which in one man strikes aloud and gives warning; in another the hand points silently to the figure, but strikes not meantime; hours pass away and death hastens, and after death comes judgment! There is something unspeakably appalling in this image.

ARMS vs. LEGS.—An individual in San Francisco, descanting on what he would do where *he* an editor, said, "If I had a newspaper office, I would arm it." A friend standing by, quietly remarked, "Yes, and at the first symptom of difficulty you would *leg it.*"

EVERY school-boy knows that a kite would not fly until it has a string tying it down. It is just so in life. The man who is tied down by a half a dozen blooming responsibilities and their mother, will make a stronger and higher flight than the old bachelor, who having nothing to keep him steady, is always floundering in the mud. If you want to ascend in the world, tie yourself to somebody.

A TRUE picture of despair, is a pig reaching through a hole in the fence to get a cabbage, that lies only a few inches beyond his reach.

SPRINGFIELD CATTLE SHOW, OCT. 25-27.

The Local Executive Committee have just had a conference with the officers of the United States Agricultural Society, and have furnished us with the Official List below, which is amended in several particulars from the lists heretofore published in some other papers:

SWEEPSTAKES PREMIUM.

Best bull and 5 cows or heifers 1 year old and upwards, from any one herd, \$500

DURHAM CATTLE.

BULLS.

Best 3 year old and upwards, - \$300
Second best 3 year old and upwards, 200
Third best 3 year old and upwards, 100
Best 2 year old and under 3 years, 200
Second best 2 year old and under 3 years, 150
Third best 2 year old and under 3 years, 75
Best 1 year old and under 2 years, 150
Second best 1 year old and under 2 years, 100

COWS.

Best 3 year old and upwards, - 200
Second best 3 year old and upwards, 150
Third best 3 year old and upwards, 100
Best 2 year old and under 3 years, 150
Second best 2 year old and under 3 years, 100
Third best 2 year old and under 3 years, 50
Best 1 year old and under 2 years, 100
Second best 1 year old and under 2 years, 75

AYRSHIRES, DEVONS AND HEREFORDS.

BULLS.

Best 3 year old and upwards, - \$100
Second best 3 year old and upwards, 75
Best 2 year old and under 3 years, 80
Second best 2 year old and under 3 years, 60
Best 1 year old and under 2 years, 75

COWS.

Best 3 year old and upwards, - 100
Second best 3 year old and upwards, 75
Best 2 year old and under 3 years, 75
Second best 2 year old and under 3 years, 50
Best 1 year old and under 2 years, 60

JERSEY CATTLE.

BULLS.

Best 3 year old and upwards, - 100
Best 2 year old and under 3 years, 80
Best 1 year old and under 2 years, 75

COWS.

Best 3 year old and upwards, - 100
Best heifer 2 years old and under 3 years, 75
Best heifer 1 year old and under 2 years, 60

MISCELLANEOUS LIST.

Best yoke of Work Oxen, - \$50
Best fat Bullock, - 50
Best fat Cow, - 50
Best milk Cow, - 50
Best Steer, - 50
Best Bull Calf of any breed, - 50
Best Heifer Calf of any breed, - 50

M. P. WILDER, President.

W. S. KING, Secretary.

NOTICES TO SUBSCRIBERS.

PREPARED COVERS.—We have prepared for Vol. XI. and XII., a lot of uniform muslin covers, with gilt backs, &c., similar to the first ten volumes. These will be sent to subscribers for 25 cents each. The binding can easily be completed by any book-binder for 25 cents. Those sending their files to the office can have them bound for 50 cents per volume.

VOLUME XII. COMPLETE.—We can supply sets of Vol. XII. complete. Bound or unbound. Price bound, \$1 50; unbound, \$1 per volume.

SPECIMEN COPIES.—We will send a free specimen copy to any person whose name and address is forwarded to us. Our present readers will confer a favor by sending us the address of their agricultural friends and acquaintances in different parts of the country.

In forwarding names or subscriptions, please give the Post-office, County, and State. Let each be written out plainly.

Markets.

REMARKS.—Flour has fallen the past week from 50 to 87½ cents per bbl, and the tendency is still downward, with a dull market. The harvest is so abundant in Europe there is very little foreign demand, nor will there be till prices are still lower with us, unless something very

unexpected takes place. Flour in many parts of Europe is at this moment considerably cheaper than in the United States. Farmers will see now that we gave them good advice, in suggesting to them to sell their wheat weeks ago, when it was much higher than at present. One hundred thousand bushels of spring wheat have been contracted for at Chicago, for one dollar per bushel, to be delivered in all November. Corn is a trifle lower, with large quantities pressing upon the market. Beef a slight decline. No change in other provisions. Wool more inquiry, but no improvement in prices.

Cotton has fallen ¼ of a cent per lb. the past week. Rice and Sugar another small advance.

The Weather has been clear and fine, though rather cold the beginning of the past week. It is now quite warm again. The season is very fine for ripening all late crops. Grass is growing as rapidly as in May, and Butter and Cheese are likely to be plenty. Late Potatoes, Turnips, and other roots are now growing finely, and promise abundantly. On the whole, we do not stand in much dread of a famine this year, and panic makers will have to try their hand upon something more promising than a prospective starvation throughout the country.

PRODUCE MARKET.

Saturday, Sept. 16, 1854.

THE prices given in our reports from week to week, are the average wholesale prices obtained by producers, and not those at which produce is sold from the market. The variations in prices refer chiefly to the quality of the articles.

The market to-day is rather dull. Produce is plenty and money scarce. Good articles stand about the same, but inferior stuff is on the decline. Potatoes are not quite as high. The peach market is very dull. They are nearly out of season. Grapes come in in abundance. Some of the dealers, we understand, are doing a good business by passing off common grapes for Underhill grapes. The Dr. has credit, probably, for raising more grapes than he dreams of. We saw a good many cranberries, which are selling for \$6@8 per bbl., Melons are about done. Eggs quite up.

VEGETABLES.—Potatoes, Mercers, \$3@3 50 per bbl.; White, \$2 75@2 25; Sweet, Philadelphia, \$4; Virginia, \$3 50; Onions, red, \$1 75 per bbl.; white, \$250@3; Turnips, Russia, \$2 75; white, \$2 50; Beets, \$3@3 50 per hundred bunches; Carrots, same; Parsnips, \$1 50; Tomatoes, \$1 per basket; Marrow Squashes, \$1 50 per bbl.; Pumpkins, \$4@7 per hundred; Cabbage \$5@12; Citron Melons, \$3@4 per hundred.

FRUITS.—Apples, \$2@2 50 per bbl.; Pears, cooking, \$4; eating, \$6@8; Peaches, \$1 50@2 per basket; Grapes, Isabella, 6c.@10c. per bbl.; Cranberries, \$6@8 per bbl.; Butter, State, 21c.@25c. per lb.; Western, 18c.@19c.; Eggs, 20c.@21c. per doz.; Cheese, 10c.@11c. per ft.

NEW-YORK CATTLE MARKET.

Monday, Sept. 25, 1854.

THERE is a decided improvement in the appearance of the cattle to-day. In a few of the yards we saw some "relicts of the past," but taken as a whole, there has not been a better lot of cattle in the Washington Yards for a long time. Much is, no doubt, due to the delightful change in the weather, but it should also be taken into account, that the animals have been fed, and have not been left to the nourishment of dried up pastures. The best cattle in market to-day, were from Chester county, Pa., and owned by Joseph Williams. He had four or five droves, most of them being in excellent condition, and selling from 9@10½c. per lb. Daniel Barnes had also a good drove of 112, from Stark county, Ohio. There were many other very good cattle in market—so good that the brokers were quite willing to talk about them—a proof, generally, that they are worth talking about. The supply of cattle is not large, and the appearance was, when we came away, that none would be left over, as they were selling quite readily. Best quality beef is selling from 7@10½c. per lb. Inferior from 7½@9c. We observe that the sheep market is very fluctuating. Last week the sales were rapid and the supply poor. This week the market is overstocked and sales quite dull. The price has fallen five or six shillings per head. We observed a very superior drove of sheep at Brownings, owned by David Poucher, of Sodas, Wayne county, N. Y. They were a mixture of the Lincoln and Leicester breeds, sixteen in number. So fine a lot of sheep we have never seen in New-York market, and we doubt whether a superior can be pro-

duced in the State. The others bear no comparison with them.

The following are about the highest and lowest prices.

Beeves,	7½c. @ 10½c.
Cows and calves,	\$30 @ \$65
Veals,	4c. @ 6c.
Sheep,	\$3 @ \$8
Lambs,	\$2 @ \$5 50
Swine, Ohio, corn fed, 4½c. @ 4½c.	
New-York State Shoats, corn fed, 5c.	

Mr. Chamberlin reports beeves, 8c. @ 10½c.; cows and calves, \$20 @ \$50; calves, 4½c. @ 6½c.; sheep, \$2 50 @ \$6 50; lambs, \$2 @ \$4 50.

Mr. Browning reports beeves, 7½c. @ 10½c.; cows and calves, \$20 @ \$50; veals, 4½c. @ 6½c.; sheep, \$2 @ \$6; lambs, \$2 @ \$5.

Mr. O'Brien reports beeves 7c. @ 7½c.; cows and calves, \$25 @ \$40; veals, 4c. @ 5½c.

Washington Yards, Forty-fourth street.

A. M. ALLERTON, Proprietor.

RECEIVED DURING THE WEEK. IN MARKET TO-DAY.

Beeves,	2590	2292
Cows and Calves,	40	
Sheep and Lambs,	1866	
Swine,	887	256

Of these there came by the Hudson River R. R., 256; Boats, 200; Erie, R. R., 678; Harlem, R. R., 345. New-York State furnished 156 on foot; 174 by cars; Ohio, 353; Indiana, 81; Illinois, 431; Kentucky, 165; Pennsylvania, 566.

RECEIVED DURING THE WEEK.

	CHAMBERLIN'S.	BROWNING'S.	O'BRIEN'S.
	Robinson st.	Sixth st.	Sixth st.
Beeves,	304	577	218
Cows & calves,	109	35	94
Veals	165	72	63
Sheep,	4,228		
Lambs,	2,329	6,476	

Mr. Samuel McGraw, Sheep broker, at Browning's, reports the following sales of sheep and lambs, viz:

SHEEP.—57 sheep, \$387 50; 50 sheep, \$206 20; 57 sheep \$203 25; 26 sheep, \$89 75; 60 sheep, \$263 95; 392 sheep, \$91420 75; 95 sheep, \$397 75; 111 sheep, \$470 75; 392 sheep, \$1338 75; 129 sheep, \$377 12; 16 sheep, \$64; 205 sheep, \$563 75; 124 sheep, \$552 75; 54 sheep, \$149 37; 27 sheep, \$75 76; 22 sheep, \$109 50; 101 sheep, \$3 53. Total—1579, \$70 23 90; averaging \$3 20 per head.

Mr. James McOrty, broker at same yard, reports an advance in the market and the following sales.

SHEEP AND LAMBS.—104 lambs and sheep, \$410 75; 188 sheep and lambs, \$745 13; 56 lambs and sheep, \$244 25; 85 lambs and sheep, \$334 50; 71 sheep and lambs, \$220; 95 sheep and lambs, \$335 75; 113 lambs and sheep, 355 37; 76 sold, \$290 50; 175 sheep and lambs, \$592 25; 90 lambs, \$239.

Sales of Sheep and Lambs at Chamberlin's by James Mortimore.

Sheep.	Price per Head.	Price per lb. for mutton
318	\$4 37½	9
108	3 87½	8½ cts.
105	4 50	9
185	4 40	9

210	2 57	8½
177	3 37½	8½
220	3 50	8½
85	3 87½	8½
108	4 50	9
116	4 25	9
Lambs.		Price per lb. for Meat.
182	2 75	10½
70	3 25	11
45	4 00	12½
23	3 00	11

The market this week has been very fair and the prices good until Friday, when the large supply being visible, made the butchers rather backward in buying, unless for from 1 @ 1½c. per lb. less than the former part of the week. The week closes with a good supply on hand and the prospect

Mutton has been selling by the carcase in Washington market from 4 @ 8½c. per lb. Lambs from 7 @ 11½c., as in quality.

DEVON CALVES.

THREE DEVON BULL CALVES—PEDIGREES WILL BE given—for sale by Edward G. Faile, West Farms, Westchester County, N. Y.

SHORT-HORN CATTLE AND SHEEP FOR SALE.

THE FOLLOWING SHORT-HORN AND OTHER STOCK, (all pure bred animals), were sent out by Mr. Rotch, of Morris, Otsego Co., N. Y., to his farm, situate one mile from Albion, the county-seat of Edwards Co., Illinois, and are now for sale, as the farm is to be disposed of. For further particulars address Col. Hudson on the premises.

Cuba.—A red and white bull, calved April 17, 1853; got by Prophet, dam Coral, by Bertram 2d, (3144) gd Conquest, by Washington, (1566) gd Pansey, by Blaize, (76) gd Primrose, by Charles, (127) gd ggggd, by Blythe Comet, (75) ggggd, by Prince, (521) ggggd, by Patriot, (486).

Prophet is a grandson of Yorkshireman, (5700) who was bred by Mr. Thomas Bates; his dam Phoenix, entered in herd book, Vol. V., page 759, as produce from Princess, &c.

Tea Rose.—A roan cow, calved May 2, 1848, got by Westchester, dam White Rose, by Splendid, (5297) gd Yellow Rose, by Young Denton, (963) gd Arabella, by North Star, (460) gd Aurora, by Comet, (155) ggggd, by Henry, (301) ggggd, by Danby, (180).

Westchester was by Yorkshireman, (5700), by thus making Tea Rose a descendant on the bull's side, from the Kirkcaldy-ington herd.

Pratt's Rose.—A red heifer calf from Tea Rose, by Prophet. See pedigree of Tea Rose.

Phasant.—A red heifer calved in the spring of 1852, by Prophet, dam Phlox, by Yorkshireman, (5700) gd Phoenix, by Hero, (4020) gd Princess, by Washington, (1566) gd Pansey, by Blaize, (76) ggggd Primrose, by Charles, (127) ggggd, by Blythe Comet, (55) ggggd, by Prince, (521) ggggd, by Patriot, (486).

These numbers are from the English Herd-book, where the full pedigree of each animal may be found.

Besides the above, there are a few South-downs, and a few French merino sheep and lambs, all purely bred, Dorking fowls, &c.

FOURTEENTH ANNUAL CATTLE SHOW AND EXHIBITION

OF THE NEW-YORK STATE AGRICULTURAL SOCIETY,

HELD IN CONNECTION WITH THE AMERICAN INSTITUTE AND NEW-YORK HORTICULTURAL SOCIETY, AT HAMILTON SQUARE, IN THE CITY OF NEW-YORK, OCTOBER 3d, 4th, 5th, AND 6th, 1854.

THE ANNUAL EXHIBITION OF THE SOCIETY WILL be held as above in the City of New-York, from Oct. 3d, to 6th, on which occasion upwards of Eight Thousand Dollars are offered as premiums to be contended for with Cattle, Horses, Sheep, Swine, Poultry, Dairy Products, Farm Implements and Machinery, domestic and other Manufactures. Flowers, Fruits and articles in all the mechanical departments, the full particulars of which will be found in the List of premiums published. A large portion of the Premiums are open to competition by persons out of the State.

It is believed that this combined Exhibition will be the most extensive ever held in this country, and will afford to Exhibitors, advantages never before offered in every department of the Exhibition, combining the entire industrial interest of the farmers, manufacturers, mechanics, horticulturists and artisans of our country.

Persons desirous of examining the list of Premiums and Regulations, or of entering stock, in all articles designed for exhibition, will please apply to B. P. Johnson, Secretary, State Agricultural Rooms, Albany, at the Rooms of the American Institute, 351 Broadway, or James, Beebe & Co., 356 Broadway, New-York, where the Premium List and Regulations will be furnished, and every desired information in relation to the exhibition given.

Stalls and fodder, for stock, and erections for the other articles will be provided in season at the show grounds on their arrival in the City where they will be provided for and protected. The following Railroads have agreed to transport all stock and articles on exhibition FREE, requiring the freight to be advanced on delivery and repaid on return of the articles with evidence of being exhibited &c.: Hudson River, New-York and Erie, New-York City and Buffalo, Ithaca and Owego, Canandaigua and Elmira, New-York Central, Rome and Watertown, New-York and Harlem, Long Island, Troy and Boston, and it is presumed all the Railroads leading into New-York, will afford the like facilities.

Application to transport articles, should be made in season to the nearest Station Agent.

B. P. JOHNSON, Sec. WM. KELLY, Pres.
Aug., 1854. 49-53

AGRICULTURAL IMPLEMENTS.

AGRICULTURAL IMPLEMENTS.—THE SUBSCRIBER keeps constantly on hand, and offers for sale the following valuable implements:

Fan Mills of various kinds, for rice as well as wheat, rye, &c. Grain Drills, a machine which every large grain planter should possess. They are of the best patterns, embracing most valuable improvements.

Smut Machines, Pilkington's, the most approved for general use.

Hay and Cotton Presses—Bullock's progressive power-presses, combining improvements which make them by far the best in use.

Grain mills, corn and cob crushers, a very large assortment of the best and latest improved kinds.

Horse Powers of all kinds, guaranteed the best in the United States. These embrace—1st. The Chain Power, of my own manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, and economy. They are universally approved wherever they have been tried. 2d. The Bogardus power, for one to four horses. These are compact, and wholly of iron, and adapted to all kinds of work. 3d. Eddy's Circular Wrought Iron Power, large cog-wheels, one to six horses, a new and favorite power. 4th. Trimble's Iron-Sweep Power, for one to four horses. 5th. Warren's Iron-Sweep Power, for one or two horses.

RAIN MILLS, STEEL AND CAST IRON MILLS, AT \$6 to \$25, and Burr-Stone at \$50 to \$250, for Horse or Steam Power.

TILE MACHINES.—FOR MAKING DRAINING TILES OF all descriptions and sizes.

WATER RAMS, SUCTION, FORCE, AND ENDLESS-chain Pumps; Leather, Gutta Percha, India Rubber Hose, Lead Pipe, &c.

CALIFORNIA IMPLEMENTS OF ALL KINDS, MADE EXPRESSLY for the California and Oregon Markets.

DRAINING TILES OF ALL FORMS AND SIZES.

CLOVER AND TIMOTHY SEED HARVESTER.—A newly-patented machine, will harvest 10 or 12 acres per day with one horse.

HAY AND COTTON PRESSES.—BULLOCK'S PROGRESSIVE-IVE Power Presses, combining improvements which make them by far the best in use.

THRESHERS AND FANNING-MILLS COMBINED—OF Three Sizes and Prices, requiring from two to eight horses to drive them, with corresponding horse powers. These are the latest improved patterns in the United States. SOUTHERN PLOWS—Nos. 10 1/4, 11 1/4, 12 1/4, 13, 14, 15, 16, 17, 18, 19, 20, 21, A, 2, 30, 50, and all other sizes. CORN-SHELLERS, HAY, STRAW, AND STALK-CUTTERS Fanning-Mills, &c., of all sizes. R. L. ALLEN, 189 and 191 Water street.

HORSE POWERS THRESHERS AND SEPARATORS.—The Endless Chain or Railway Powers of our own manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, durability, and economy. They are universally approved wherever they have been tried.

2d. The Bogardus Power, for one to four horses. These are compact and wholly of iron, and adapted to all kinds of work. 3d. Eddy's Circular Wrought-Iron large Cog Wheels, for one to six horses. A new and favorite power.

4th. Trimble's Iron-Sweep Power, for one to four horses.

Threshers.—Improved Threshers upon the best principles, threshing clean with great rapidity, and scarce ever breaking the grain.

One-Horse Undershot.....\$25

Two-Horse do.....\$30 to \$35

One-Horse Overshot.....\$25

Two-Horse do.....\$33 to \$38

Separator, which greatly facilitates cleaning the grain and preparing it for the fanning mill.....\$7 to \$10

All the above-named machines are guaranteed the best in the United States. R. L. ALLEN, 189 and 191 Water st., N.Y.

PERUVIAN GUANO.—First quality of Fresh Peruvian Guano, just received in store. R. L. ALLEN, 189 and 191 Water st., N.Y.

DIRECTIONS FOR THE USE OF GUANO.—A full and minute description of the different crops and soils to which Peruvian Guano is adapted, with full directions for its application, a pamphlet of 96 pages, and can be sent through the mail. Price 25 cents. R. L. ALLEN, 187 and 191 Water st.

BOOKS FOR THE FARMERS. ALL SENT FREE OF POSTAGE.

Furnished by R. L. ALLEN, 189 and 191 Water street.

I. The Cow, Dairy Husbandry, and Cattle Breeding. Price 25 cents.

II. Every Lady her own Flower Gardener. Price 25 cents.

III. The American Kitchen Gardener. Price 25 cents.

IV. The American Rose Culturer. Price 25 cents.

V. Prize Essay on Manures. By S. L. Dana, price 25 cents.

VI. Skinner's Elements of Agriculture.—Price 25 cents.

VII. The Pests of the Farm, with Directions for Extirpation, Price 25 cents.

VIII. Horses—their Varieties, Breeding, Management, &c., Price 25 cents.

IX. The Hive and Honey Bee—their Diseases and Remedies, Price 25 cents.

X. The Hog—their Diseases and Management, Price 25 cents.

XI. The American Bird Fancier—Breeding, Raising, &c., Price 25 cents.

XII. Domestic Fowl and Ornamental Poultry. Price 25 cents.

XIII. Chemistry made Easy for the Use of Farmers, Price 25 cents.

XIV. The American Poultry Yard. The cheapest and best book published. Price \$1

XV. The American Field Book of Manures. Embracing all the Fertilizers known, with directions for use. By Browne. Price \$1 25.

XVI. Skinner's Kitchen Gardener. Price 75 cents.

XVII. Storckort's Chemical Field Lectures. Price \$1.

XVIII. Wilson on the Cultivation of Flax. Price 25 cents.

XIX. The Farmer's Cyclopaedia. By Blake. Price \$1 25.

XX. Allen's Rural Architecture. Price \$1 25.

XXI. Phelps' Bee Keeper's Chart. Illustrated. Price 25 cents.

XXII. Johnston's Lectures of Practical Agriculture. Paper, Price 50 cents.

XXIII. Johnston's Agricultural Chemistry. Price \$1 25.

XXIV. Johnston's Elements of Agricultural Chemistry and Geology. Price \$1.

XXV. Randall's Sheep Husbandry. Price \$1 25.

XXVI. Miner's American Bee Keeper's Manual. Price \$1.

XXVII. Dodd's American Cattle Doctor. Complete. Price \$1.

XXVIII. Fessenden's Complete Farmer and Gardener. 1 vol. Price \$1 25.

XXIX. Allen's Treatise on the Culture of the Grape. Price \$1.

XXX. Youatt on the Breeds and Management of Sheep.—Price 75 cents.

XXXI. Youatt on the Hog. Complete. Price 60 cents.

XXXII. Youatt and Martin on Cattle. By Stevens.—Price \$1.

XXXIII. The Shepherd's own Book. Edited by Youatt, Skinner and Randall. Price \$2.

XXXIV. Stephens' Book of the Farm; or Farmer's Guide.—Edited by Skinner. Price \$4.

XXXV. Allen's American Farm Book. Price \$1.

XXXVI. The American Florist's Guide. Price 75 cents.

XXXVII. The Cottage and Farm Bee-keeper. Price 50 cents.

XXXVIII. Hoare on the Culture of the Grape. Price 50 cents.

XXXIX. Country Dwellings; or the American Architect. Price \$6.

XL. Lindley's Guide to the Orchard. Price \$1 25.

XLI. Gunn's Domestic Medicine. A book for every married man and woman. Price \$3.

XLII. Nash's Progressive Farmer. A book for every body in the country. Price 50 cents.

XLIII. Allen's Diseases of Domestic Animals. Price 75 cents.

XLIV. Saxton's Rural Hand-books. 2 vols. Price \$2 50.

XLV. Beattie's Southern Agriculture. Price \$1.

XLVI. Smith's Landscape Gardening. Containing Hints on arranging Parks, Pleasure Grounds, &c., &c. Edited by Lewis F. Allen. Price \$1 25.

RECENTLY PUBLISHED.

XLVIII. The Farmer's Land Measurer; or Pocket Companion. Price 50 cents.

XLIX. Buist's American Flower Garden Directory. Price \$1 25.

L. The American Fruit Grower's Guide in Orchard and Garden. Being the most complete book on the subject ever published.

SUFFOLK PIGS FROM THE STOCK OF PRINCE ALBERT, which gained the gold medal at Smithfield Club, England, also the first prize at the exhibition of the Norfolk Agricultural Society, Massachusetts, 1853, two to three months old, supplied with food delivered on board Express cars or vessels, on receiving thirty dollars per pair. Or they will be sent to any part of the United States, upon receiving a certificate of deposit for forty dollars, from the Postmaster, that upon their reception, in good order, free of expense, he will pay.

Address JAMES MORTON, West Needham, Mass. Or GEORGE H. P. FLAGG, Boston, Massachusetts.

FLAX STRAW.

FLAX STRAW WANTED.—THE NEW-JERSEY FLAX Wool Company are prepared to purchase Flax Straw unrotted, either pulled or cradled, by the quantity put up as dried hay in bale; or it will be preferred if broken up and rendered portable. Address, post-paid, WM. JEPHSON TAYLOR, 44 Wall-st. 44-56

MACHINE WORKS.

M. & J. H. BUCK & CO.'S MACHINE WORKS, LEBA NON, N. H. Manufacturers of a great variety of wood working machinery, of the most approved style, simple construction, and effective and firm operation, to be found in the country; comprising complete sets for making Railroad cars, doors, sash and blind, ship-building, bedsteads, cabinet, and carpenter work, &c., &c. Also, some machines of peculiar merit, such as for single and double Tenoning, capable of making from one to four tenons at the same operation of any width, size, or length, on large or small timber, with revolving cylinder attached. Also, an improved timber Planing machine, with the addition of a side cutter, with which the top and edge of timber or plank is planed, whether square or bevel, at the same operation, and in the same time occupied in planing but one side on all other machines. They also manufacture circular, single, and gang saw-mills, flouring and corn mills, hand and power hoisting machines for storehouses, shafting, hangers, pulleys, and mill gearing of all patterns.

MARTIN BUCK, J. H. BUCK, F. A. CUSHMAN, WM. DUNCAN,

AGENTS.—R. L. Allen, 189 & 191 Water st.; S. B. Schenck, 163 Greenwich st.; Andrews & Jessup, 67 Pine st.; Lawrence Machine shop, 51 Broad st., and Lawrence, Mass.; Leonard & Wilson, 60 Beaver st.; Wm. F. Sumner, Crystal Palace. [36-17]

TREES AND PLANTS.—PARSONS & CO., FLUSHING, near New-York, offer for sale their usual assortment, with the addition of many rare novelties of Fruit Trees, for the Orchard and the Garden; Ornamental Trees, Shrubs, and Roses, for the Avenue, Lawn, or Cemetery; Vines for the Grapery, and Exotic Plants for Greenhouse culture. Catalogues can be obtained at No. 60 Cedar street, or will be sent by mail to all post-paying applicants enclosing a postage stamp. 23-71

PORTABLE FORGES AND BELLOWES.

QUEEN'S PATENT. THE BEST Forge in the market for Blacksmith's work, Boiler Makers, Mining, Quarrying, Shipping, Plantations, Contractors on Railroads and Public Works, Copper-smiths, Gas Fitters, &c., &c. Also an improved PORTABLE MELTING FURNACE for Jewellers, Dentists, Chemists, &c., both of which are constructed with sliding doors to protect the fire from wind and rain when used out of doors, and for perfect safety and free escape of smoke indoors. They are compact for shipping. Circulars, with particulars and prices, will be forwarded upon application. Cast Iron Columns for buildings constantly on hand. The above forge has been awarded three Silver Medals by the American Institute, New-York, and the highest premium (Diplomas and Bronze Medals) at all other Fairs wherever exhibited. FREDERICK P. FLAGLER, Sole Manufacturer, 210 Water st., N.Y. 31 57

WACHUSETT GARDEN AND NURSERIES.

NEW-BEDFORD, MASS., ANTHONY & MCAFEE, PROPRIETORS, Successors to Henry H. Crapo, would invite the attention of the public to their extensive stock of Fruit and Ornamental Trees, Flowering Shrubs, Rose Bushes, &c., Evergreens, Balsam Firs, American and Chinese Arbor Vite, Cedrus Deodara, Cryptomeria Japonica, Norway Spruce, Yew Trees, Tree Box, &c., an extensive assortment of Apple, Pear, Plum, Cherry, Peach and Apricot Trees.

The stock of Pear Trees is very large, both on Pear and Portugal Quince Stocks, embracing every thing worthy of cultivation. All our Pear Trees are propagated and grown by ourselves, and

WARRANTED TRUE TO NAME. The soil, climate, &c., of this locality being so favorable to the Pear, our trees are unrivalled for HEALTH, vigor of growth, &c., &c.

They are all free from that destructive malady THE PEAR BLIGHT, which has never existed in this locality.

Prices low, and a liberal discount to the trade. New-Bedford, Jan. 1st, 1854. 17-68

WHOLESALE FISH STORE.—500 BBLS. SALMON, 2000 bbls. Mackerel, first quality, 3000 Small Packages Mackerel, 200 bbls. New Shad, 500 half Shad, 1000 bbls. New Herring, 300 half New Herring, 1000 quintals New-Dried Cod fish, 500 Jars New Anchovies, 500 Kegs New Dutch Herring, 2000 Boxes New Smoked Herring, 3000 lbs. New Smoked Salmon, 500 Kitts New Soused Salmon, 500 Kegs New Spiced Herrings, Sword-Fish, Blue-Fish, Pickled Cod, Haddock, Halibut, White-Fish, Sturgeon, Trout, Dun Fish, &c.

For sale by NELSON WELLS & CO., 81 Dey street, between Washington and West, New-York.

MAY 13th, 1852. NELSON WELLS. 1-53 S. H. WOOD.

SEEDS.—TIMOTHY; RED AND WHITE CLOVER; BLUE Grass; Orchard Grass; Bay Grass; Red Top; Sugar Corn; Peas; Beans; Turnip; Cabbage; Beet; Lettuce; Onions; Radish; Squash; Osage Orange; Large Yellow Locust, and all other kinds of field and garden seeds. Also Rhubarb Roots; Asparagus Plants, &c. R. L. ALLEN, and 191 Water street.

WILLARD FELT, NO. 191 PEARL STREET, (NEAR Maiden Lane.) Manufacturer of Blank Books, and Importer and Dealer in Paper and Stationery of every description. Particular attention paid to orders 26-77

STOCK.

IMPROVED STOCK OF ALL KINDS.—HAVING HAD great experience in breeding and rearing fine stock for the past twenty years, I offer my services to my friends to procure it of the best and most reliable kinds. As much notice as convenient is at all times desirable previous to purchasing, as it takes time to make good selections. Early in August or September is the best time to purchase for the South.

Short Horn or Durham cattle, Devons, Herefords, Alderney or Jersey and Ayrshires. Long-wooled Sheep—the Cotswold, Oxford, Leicester, Bakewell, and Lincoln. Mutton Sheep—the Southdown. Fine-wooled Sheep—such as the Saxon, Epanish, and French Merino.

The public should be on their guard in purchasing improved stock, as many animals are palmed off upon the unsuspecting and ignorant, which are spurious. A. B. ALLEN, Nos. 189 and 191 Water.

Special Notices to Subscribers, Correspondents, &c.

Subscriptions can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September as a half yearly volume of 416 pages, with a complete index—begins on each of those dates.

Those wishing their papers changed from one office to another, should give the name, county, and State, of their old and new Post-office.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by Mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Clubs may add to their number at the same rate per copy as was paid by the original members.

The paper is stopped when the time for which it is paid expires. A notice or bill is usually sent in the last number.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then enclose them in the presence of the Post-master. Give the Post office, and the County and State. *Write these very plainly.*

Economical Arrangement to furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished with Harper's Magazine, one year for	\$4 00
" Putnam's do	4 00
" Knickerbocker do	4 00
" Eclectic do	6 00
" Little's Living Age do	6 50
" National Magazine do	3 50
" Dickens's Household Words	3 50

Address ALLEN & CO.,
189 Water street, New-York.

J. A. GRAY, Printer, 95 and 97 Cliff street, N.Y.

PUBLISHERS' ANNOUNCEMENT!

Thirteenth Volume of

THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

THE AMERICAN AGRICULTURIST,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

N. B. The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume for the bound work.

COMPREHENSIVE IN ITS CHARACTER,

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and uostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers only that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon *its own merits*; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammeled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the editorial supervision of Mr. A. B. ALLEN,—its principal editor for the first ten years—and Mr. ORANGE JUDD, A.M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical agriculture, and, in addition to these, a number of other eminent agricultural and horticultural writers.

All the editors are men practically experienced in their profession, each of whom can handle the Plow as well as the Pen.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers,	-	-	-	\$2.00 a year,	\$2.00
" Clubs of 3 do.	-	-	-	1.67 "	5.00
" 5 do.	-	-	-	1.60 "	8.00
" do. 10 do.	-	-	-	1.50 "	15.00
" do. 20 do.	-	-	-	1.25 "	25.00

The money always to accompany the names for which the paper is ordered.

The Post-Master, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Post-Master, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, *Weekly Tribune*, or *Weekly Times*, or any other paper or periodical in this city, not costing to exceed two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if enclosed and mailed in the presence of the Post-Master.

Communications for the paper should be addressed to the Editors; subscriptions, advertisements, and all matters relating to the business department, should be addressed to the Publishers,

ALLEN & CO.,

189 Water street, New-York

AMERICAN AGRICULTURIST.

Designed to improve the Farmer, the Planter, and the Gardener.

AGRICULTURE IS THE MOST HEALTHY, THE MOST USEFUL, AND THE MOST NOBLE EMPLOYMENT OF MAN.—WASHINGTON.

PUBLISHED WEEKLY BY ALLEN & CO., 189 WATER ST.

VOL. XIII.—NO. 4.]

NEW-YORK, WEDNESDAY, OCTOBER 4, 1854.

[NEW SERIES.—NO. 56.]

FOR PROSPECTUS, TERMS, &c.,

SEE LAST PAGE.

AGRICULTURAL SHOW.—It is now too late, if not needless, that we should say more in reference to this Exhibition. Doubtless every farmer in New-York State who could do so has ere this made arrangements to be among the army of visitors to Hamilton Square. There will also doubtless be present large delegations from Connecticut, New-Jersey, Pennsylvania, and other States. To promote the convenience of those who are not familiar with New-York city, we have again inserted a

NEW-YORK CITY DIRECTORY AND MAP,

which will be found on the 56th, 57th, and 58th pages. With this map, and the accompanying directions, a stranger can make his way through any part of the city without difficulty. We also refer our readers to our advertising columns, and especially to page 61 for Hotels, Lodgings, Eating Houses, &c.

PATENT CIDER MILLS.

THESE are convenient machines, better perhaps for limited use than almost any other patent of the kind, if people only knew how to manage them. The idea of a man's taking one into his wagon, and traveling over the country to do up the apple grinding and squeezing of any one farmer within a few hours, is all nonsense. The pomace, to yield good cider for any purpose, requires to be exposed to the air in a broad, shallow vat, from twenty-four to forty-eight hours, according to the weather, and turned two or three times with a wooden shovel, to absorb the oxygen of the atmosphere, which ripens, sweetens, and colors the liquor, giving it body. It should then be laid up, and pressed slowly, and for the best of cider, be twenty-four to forty-eight hours under the process. For vinegar, or apple butter, this course of proceeding is equally essential as when the cider is made for drinking. These articles require strong-bodied cider. The chief objection to these modern, fast mills is, the application of iron teeth or graters, in the grinding process. Iron vitiates apple juices, and hence is objectionable, if it remain long in contact with it. For large cider vats, the old-fashioned, wooden nut-mill, where it grinds the apple sufficiently fine, or better still, the revolving stone of four or five feet in diameter, moving in a circular vat or trough, and drawn by a horse, are the best cider mills ever invented. New things are not always the best, especially in cider making.

VIRGINIA STATE AGRICULTURAL SHOW.

LAST year we visited and reported upon the first exhibition of the Virginia State Agricultural Society, and were so well pleased that we designed to be present again this year, but we fear that ill health, and a press of duties in the office, will prevent our doing so. The Exhibition is to be held at Richmond, Oct. 30 to Nov. 3. There is a large number of premiums, many of them \$50 to \$100 each, and judging from what we have already seen, and what we learn by private letters, this show will be one of the best of the season.

FAIRFIELD COUNTY (CONN.) SHOW.

ONE of the best local or County Shows we have ever visited, was held from Tuesday to Friday of last week, at Stamford, Fairfield Co., Conn. We have not space to go into particulars, but must notice a few things. The town of Stamford alone, raised by subscription the amount of \$1,015. A new tent covering about 9,000 square feet, was purchased by the Society at a cost of some \$700, out of surplus funds from last year. About \$1,000 were given as premiums. Over \$2,000 was realized this year from subscriptions, memberships, and shilling tickets of admission.

The tent was well filled with agricultural products and specimens of mechanical skill. The ladies contributed largely. Of vegetables, JOHN W. HUBBARD exhibited 128 varieties, G. K. RIKER 94, and JAMES W. FAULKNER 79. There was a very large and beautiful display of American Porcelain, manufactured by the American Porcelain Company, of Green Point, L. I. Several swarms of bees, in hives filled with beautiful honey, attracted considerable attention. We pass over the fine carriages, agricultural implements, clothing, &c., &c.

Outside the tent, on a spacious field near by, was an extensive exhibition of animals, including sheep, swine, poultry, and some 200 horses. But the great feature of the Show was the exhibition of working and fat cattle and milch cows. Immense trains of oxen came in from different towns, one of which, from Greenwich, alone numbered 86 yoke. The fat cattle could scarcely be surpassed. We noticed two pairs of these, exhibited by Col. THOMAS A. MEAD, of Greenwich, one of which weighed 4,800 lbs., and the other 4,300 lbs. We did not remain to witness the plowing and spading matches on Friday, for which there were, up to Thursday evening, 15 entries for plowing and 13 for spading.

During the afternoon and evening of each day, meetings were held in the tent, during which speeches and brief addresses were made by several gentlemen, including Messrs. P. T.

BARNUM, Rev. E. H. CHAPIN, of New-York, GEORGE WARING, Dr. DADD, veterinary surgeon of Boston, and others. Mr. JUDD, of the *American Agriculturist*, was called out at different times to speak upon deep plowing, the inutility, as a general thing, of soil analyses, the advantages and pleasures of a knowledge of chemistry to ladies, and to present the claims of the Connecticut State Agricultural Society upon the farmers generally. He also gave a brief address to the children of the public and private schools, who, in company with their teachers, visited the tent in a body on Wednesday afternoon. They came both from Stamford and the neighboring towns. This was a very interesting feature of the exhibition, and worthy of imitation. Among the *live* stock, we think the show of the *human*, from fifteen years down to two years and younger, not the least important.

AGRICULTURAL IMPLEMENTS.

MOWERS, REAPERS, &c., AMONG FARMERS—
OTHER HINTS.

PERHAPS in no one of the mechanical arts has there been greater improvements within the past half century, than in that of the manufacture of agricultural implements. Within this time more has been done to perfect the plow, than was done before for two thousand years; while harrows, rollers, cultivators, shovels, spades, hoes, forks, and many other implements for the field and garden, have been improved in so superior a manner, as to have almost become new implements. But the greatest labor-saving machines recently brought into use—although not absolutely new inventions—are the mower, the horse-rake, and hay press; the reaper, thresher, winnower, and horse power. The saving in labor, at a time when most in demand, and at its highest rates—in the invention and improvement of harvest implements—is immense; but a still greater saving is in that of the hay and grain crops. By the use of these implements the farmer is enabled to cut his grass and grain at the proper time, secure them in the best condition, and get them to market in season. Previously there was so much loss in hay and grain for want of hands to secure them at the proper time and in good weather, that it was often equivalent to one-fourth, and in some instances, one-half of the harvest.

It gives us great pleasure to observe that intelligent farmers are becoming alive to their true interests, in availing themselves of the use of these new and improved implements; adding greatly thereby to the value of their property, and not a little to their comfort and happiness. Others not so well informed still remain in the background, and are consequently laboring un-

der all the old disadvantages in cultivating their land. This is owing doubtless more to the want of information than to any other cause; for surely no sensible man would stand long in his own light, if he knew how to obtain, and had proper confidence in such things as were required for his advantage.

Happily opportunities now present themselves to obtain this information in most of the great localities, in the establishment of agricultural warehouses, where these implements can easily be seen; but above all in the multiplicity of agricultural Exhibitions, which are now annually held in every county of some of the States. To these we would particularly direct the attention of farmers. Here they will see many of these machines in operation, and be able to learn from ocular demonstration what is most suitable for them to obtain, to cheapen and facilitate their operations on the farm.

When an implement is too costly for one farmer to purchase, it is very easy for him to unite with his neighbors, and thus obtain it for general benefit. One reaper or mower, for example, may be sufficient to do the work for a dozen or more farmers, and do it in season; for their crops of grain and grass usually mature at quite different periods. It is the same also with horsepowers and threshers, and occasionally the case with a gang of plows, a large iron roller, &c.

We respectfully suggest to the officers of the County Agricultural Societies, to take these things into consideration, as it would be very easy for them to procure a model set of implements for general use. The money would be well laid out for these in most instances, if only kept on hand in some central place, for the mere inspection of the farmer, and as a guide to his future purchases. *

COTTON IN ALGERIA.

NEARLY a column of the *Moniteur* is devoted to the public sale on the 26th ult., at Havre, of a quantity of cotton from Algeria. It affirms that competent judges—Swiss, German and Manchester spinners, pronounced the article excellent, and enunciated the wish that Algeria might soon become an important competitor of the United States, and “thus rescue European industry from the exactions, every year more and more marked, of the American planters.” The cotton was eagerly bought at good prices. Most of it will be manufactured for the Universal Exhibition in the Champs Elysees.

We rejoice in learning that this fine country is producing good cotton; but we think the tone of the *Moniteur* is very reprehensible in the manner of announcing it. American planters make no “exactions.” They raise their cotton openly and above board; and when it is ready for market, they take of course the best price they can get for it. And this price is not so much fixed, let it be remembered, by the planter as by the English, French and German manufacturers. They pay what it is worth to them and no more, and simply because they cannot buy any where else so good a quality at so low a price. This is the amount of their exaction.

To triumph over our passions, is of all conquests the most glorious.—*Seneca.*

THE BEST SOIL FOR FRUIT TREES.

AFTER almost a half century of experience in raising fruit, we are decidedly of opinion, as a general rule, that the best soil on which to raise fruit, is that just cleared of a forest. The surface should be rolling or descending, and moderately dry and rich. Such ground needs little or no preparation; the roots of the forest trees as they decay, keep it loose and mellow, and afford the exact food necessary for a rapid and healthy growth of the fruit trees; and the soil abounds plentifully in those elements which are requisite to form the most perfect fruit. Another consideration, and a very important one is, that fruit trees grown on recently-cleared forest land, are much less diseased than those grown on old land, and the fruit is not near so liable to be attacked by insects.

Any one going from an old settled country to a new one, will not fail to observe the remarkable difference between the trees and fruit of the one and the other. How much thrifter they are in the latter than in the former, and how much larger, fairer and more perfect the fruit.

We would advise those contemplating setting out new orchards, if they have no wood land to clear for this purpose, to set apart as much as they desire for fruit, and let it grow up with young forest or other trees as rapidly as possible. Even a few years' growth will answer a good purpose, provided they are cut down and allowed to lie on the land; and when dry, burnt off where they are, and the ashes permitted to remain. This is undoubtedly one of the best preparations and *manures*—if we may so use the term—that can be obtained.

In growing peaches, &c., we have found—other things being equal—that new orchards usually did best planted on old orchard ground, the trees set as near as possible to the decaying stumps. Previous to planting, however, the soil should be broken up at least two feet deep, if possible, and ashes and such other fertilizers added as are necessary to insure a good growth.

Granite soils are among the best for fruit, as this rock abounds in feldspar and mica, both of which contain potash—feldspar more than mica. As these rocks disintegrate and enter into the composition of the soil, they supply one of the most necessary elements for the formation of good trees and fruit. We will also add that some of the best orchards which we have seen, were on alluvial (loamy) soils, lying upon limestone rocks which came up near the surface.

THE CROPS.

It is greatly to the interest of farmers to be told the truth as near as it can be ascertained in regard to the crops. This we always endeavor to do to the best of our ability. To flatter them with the idea that crops are short when they are not, and hold out the delusive prospect of continued high prices is extremely wrong.

Those who have read our articles on this subject for weeks past, know well that our opinion was, that crops were generally a full average or more, with the exception of corn and potatoes; and that we maintained the former was not near so deficient as many imagined, and the latter had suffered little from the rot, and the late rains would probably make the yield of potatoes quite

as large as that of last year, deducting what was then destroyed by the rot.

It affords us pleasure to find the following candid and well-considered article in the Cincinnati Gazette, on the subject of the crops of the Western Middle States. We recommend its attentive perusal to all interested on the subject. Prices have fallen somewhat since the article was written for the Gazette, but we let them stand as the writer put them down.

The principal products of the middle Western States are corn, wheat, oats, tobacco, hogs, cattle, sheep, and wool. Of these there is an admitted increase in oats, hogs, sheep, and wool; wheat is an average crop, and cattle are fully as numerous as last year. Tobacco is probably short, and corn is certainly deficient from one-half to one-fourth. Now of all the staple products named, corn and tobacco are the only ones short. Potatoes are also short, but on the other side there is an unusually abundant crop of hay.

Taking Missouri, Illinois, Indiana, Ohio, Michigan, Wisconsin, Iowa, Kentucky and Tennessee, the aggregate products of leading articles in 1850 were as follows:

Sheep.....	head.....	9,652,900
Wheat.....	bush.....	47,598,000
Corn.....	do.....	329,185,000
Oats.....	do.....	58,200,000
Wool.....	lbs.....	18,989,000
Tobacco.....	do.....	49,608,000
Hogs.....	head.....	14,526,000
Potatoes.....	bush.....	15,697,000

Corn, it is seen, is the largest crop, and therefore it is the most important so far as regards domestic consumption; but for foreign export, wheat is the most valuable. Since the census of 1850, from which the above figures were taken, was compiled, there have been four crops of corn including that now standing, and each of these, with the exception of the latter, increased over that which preceded, and it is well known that the crop of 1853 was in the aggregate the largest gathered. *Of this there is a large surplus still on hand—say ten per cent. of the whole.* Add to this the product of the increased breadth of the land planted, say ten per cent., and we have twenty per cent. to offset an estimated deficiency of say thirty-three per cent., leaving an actual deficiency of only about thirteen per cent. in supplies for the ensuing year.

Corn is used chiefly for feeding cattle, and there are therefore substitutes for it. Hogs consume a large quantity, and for this must can be substituted to a great extent; and the fact that there is *an unusually large crop of mast* in the country this season, is, therefore worthy of *special notice.* As a substitute in feeding cattle, there are oats, of which there is an *excessively heavy crop.* Putting all these facts together, and we find nothing serious connected with the partial failure of the corn crop.

Of wheat, we believe there is a full average. Oats, as already remarked, are largely in excess. Wool has increased, and so have sheep and hogs. Blending these several products into one grand aggregate, and the result will show an *excess* rather than a *deficiency* as compared with last year. In hogs, the increase is immensely large over either of the last three years. Tobacco and potatoes are deficient in quantity, as also some minor products; but there are others, not specified, which show an increase. So much for quantity.

With regard to prices, it is evident that farmers are gaining largely over other seasons. Last year, it is very well known, was a season of very high prices, but current rates for most products, are above the average for that season. The following is a comparison of present prices and the averages for previous years, for a few articles:

	1851-2.	1852-3.	1853-4.	Present prices.
Corn per bush.....	20	42	45	65

Oats.....	—	38	45
Wheat.....	60	75	125
Flour per bbl.	315	380	650
Hogs per 100 lbs.			
net.....	470	631½	447
			500

Potatoes, which usually range from 30 to 50 cents per bushel, are now selling at \$1 to \$1 20. Beef cattle range from \$5 50 to \$7 per 100 lbs. nett. Sheep are selling at \$2 20 to \$3 per head. Hay \$15 to \$18 per ton. Wool is below last year's prices, and this is about the only article that is low. We are aware that high prices are not favorable to the interests of the country at large, unless the demand is from abroad; but we have presented sufficient facts, both as regards quantity and value, to show most conclusively that those who have been engaged in cultivating the soil, are being amply paid, and thus we have prosperity at the base of all our interests.

CONNECTICUT STATE AGRICULTURAL SHOW.

THIS first exhibition of the Connecticut State Agricultural Society, will open at New-Haven, on Tuesday next, (Oct. 10,) and continue until Friday afternoon. All possible efforts have been made by the indefatigable officers of the Society, to perfect every arrangement necessary to make the exhibition one worthy of the State, and they will doubtless succeed. The convenience of access from this city and State, as well as from New-Jersey, and the neighboring New-England States, will induce many visitors to attend from beyond the borders of Connecticut. The mechanics and traders of this city will find this Show a good opportunity to exhibit, and thus advertise their wares, and we hope the opportunity will be embraced. Any persons desiring further information can address the Corresponding Secretary, HENRY A. DYER, Esq., at the New-Haven Hotel, New-Haven.

The following are some of the arrangements by the Executive Committee:

Persons desiring to exhibit are earnestly requested to make entries of such stock or other articles as they wish to enter for premiums, on or before Monday, the 9th. Entries may be made at the store of Munson & Johnson, 49 State street, or at the business office on the grounds, in New-Haven, and the store of F. A. Brown, 182 Main street, Hartford, or by letter addressed Henry A. Dyer, New-Haven Hotel, New-Haven.

On Tuesday, the 10th, the Judges will enter upon their examination. The grounds will be open on Tuesday to members of the Society.

On Wednesday, 11th, the exhibition will be open to the public, and continue open three days.

On Wednesday the trial of working-oxen will take place at 8 o'clock, P. M., with a loaded cart, on the grounds.

Thursday morning, at 9 o'clock, will commence the exhibition of horses within the grounds; a fine half-mile track has been prepared, and every convenience for the proper display of this department has been arranged.

On Thursday afternoon, at 2 o'clock, will take place the plowing-match, on the town farm near the enclosed grounds.

On Friday, at 11 o'clock, A. M., will be delivered the annual address, on the grounds. The reports of Judges and awards of premiums will be read at 2 o'clock, on the same day, at the same place, after which it is expected that persons having any articles on exhibition will take charge of the same.

THE "MAST."—It is an extraordinary fact that though the dry character of the season has cut off the late crops there is a most astonishing mast. The oak trees loaded with acorns,

and some of them, we are told will yield ten bushels. These acorns, we are informed by those who ought to know, for the purpose of fattening hogs, are equal to corn, particularly is it the case with the acorns from the white oak. Where our farmers live in the neighborhood of forests they will be able to make nearly their usual quantity of pork, especially if they have sufficient corn to feed their hogs a few weeks. Mast fed pork is not, however, in as high esteem as that which is corn fed; but a good deal of the former will be brought to market the coming fall.—*Springfield (Ill.) Journal.*

TO FARMERS.

It is desirable, for the public benefit, that some distinct and absolutely convincing information be obtained, and made generally known, with regard to *hired agricultural laborers* in the United States. For this purpose, replies to the inquiries made in this circular are requested from any persons willing to give them, from all parts of the United States. A digest of the replies will be prepared and made public. Address

F. L. OLMSTED, Southside, Staten Island, N. Y.

I. Are the majority of hired agricultural laborers in your vicinity native or foreign born? (If foreign, please state of what nation.)

II. (a) About what has been the average rate of wages, during the last five years, for able-bodied men of moderate capacity, able to plow and mow—board found by employer? (b) When hired by the day in the summer months? (c) When hired by the month in the summer months? (d) When hired by the day in harvest season only? (e) When hired by the month in harvest season only? (f) When hired for the whole year?

III. What are the usual wages of raw hands, or recent emigrants unaccustomed to American implements and methods of labor, hired by the year, and board found by the employer? (a) speaking the English language? (b) not speaking English?

IV. Do the majority of farmers (proprietors of land, the chief value of which depends upon its agricultural productions) employ hired laborers at all in your part of the country?

V. Could more laborers find employment steadily and permanently at the rate of wages you have mentioned?

VI. (1.) Is it a *frequent, occasional, or extremely rare* occurrence for men who have been employed as hired hands upon farms within your observation, to come upon the public for support of life, or to be dependent in any way upon charity? (2.) Does this ever happen to men of sound body and not of intemperate habits?

VII. Is it a general occurrence within your knowledge that men who have been hired laborers upon farms before they were twenty-five years old have become independent proprietors, or acquired property sufficient to be free from the necessity of personal labor before they were fifty?

VIII. Are there many instances in your part of the country of men who have acquired wealth and positions of influence and honor, who have been previously employed as hired agricultural laborers?

IX. Are the majority of agricultural laborers frugal (laying up or employing as permanent capital, one-half their earning-) and ambitious, having the purpose to own land, or otherwise live independently?

X. Do the majority of them take their meals at the same table with their employers?

XI. Are they supplied with as much food as they wish to eat?

XII. (1) Do they generally have meat in any form once every day? (2) Do they generally have fresh meat once or oftener, each week?

XIII. About what is the cost, per week, of laboring-men's board?

XIV. Are they generally decently and comfortably clothed?

You will confer a favor by adding any other information or suggestion you think proper with regard to the demand and supply of labor, or the condition and character of laborers.

Information of a similar character is also desired with regard to female domestics.

SHEEP BREEDING.

WE cut the following from the Ohio Cultivator, and recommend particularly attention to the writer's objections to horns. Were we keeping Merinos or Saxons, we would soon breed off their horns; which we consider as objectionable in these as in South-down or Long-wools. The horns could be easily got rid of in a few generations, by commencing with the male lambs, and searing with a red hot iron the first horny bulge which appears on the head. This is done without pain to the lamb, and prevents the future growth of the horn. Breed then from these bucks, and so continue a few generations, when nature will finally get tired of producing horns to be seared off with a red hot iron.

Now is the time for flock-masters to look well to their ewes, selecting such as possess those characteristics which they desire to perpetuate, and rejecting those that are fit for nothing but the butcher. Sufficient attention is seldom given to this point, for though it is perfectly true that the male, in all animals, is of more importance than the female, yet for the production of perfect animals, it is absolutely necessary that both male and female be well bred, and, if not individually perfect in every point, the conformation of the *two* should be such as, when combined, form the animal desired. Good breeders understand this matter well, and assort their flock into several lots, procuring a buck for each lot with those points strongly developed in which the ewes are most deficient. But a vast proportion of farmers who keep more or less sheep, neglect this matter altogether. They often procure a buck, which, however useful he might be for other flock, is totally unfit for that which he is intended to serve. Again, in a large flock of ordinary sheep, there are often two or more kinds of ewes with characteristics entirely different from each other; hence, a buck that might be beneficial to the one would be altogether unsuited to the other, and more likely propagate imperfections than to neutralize them; yet how common is it to let the whole flock run together, and have the indiscriminate use of the same bucks. With judicious selection any of our ordinary heterogeneous flocks might, in a few years, be vastly improved without any more expense than is incurred by the present heedless, careless, and unprofitable system of breeding.

The present price of mutton has led many, in this vicinity, at least, to cross their common Merino sheep, with a Leicester or Southdown buck, for the purpose of obtaining good sized lambs for the butcher. We believe good mutton will always command a good price, higher than at present, and that this system of crossing fine-wooled with mutton sheep, will be the most profitable species of sheep husbandry.—We do not like to recommend any one to breed from such a cross, yet we are not sure but a little South-down blood would improve the size, constitution, and fattening qualities of our *common sheep*, without materially injuring the quality of wool.

The time to place the bucks with the ewe depends upon the location, the breed, and the object of the breeder. As a general thing, it is not desirable to have lambs before there is some grass for the mother, and as ewes go from 22 to 28 weeks, it is easy to calculate in any individual case. In Western New-York, the first of November is considered best. At this season grass is scarce and innutritious, and it is par-

ticularly desirable that ewes be well kept while the buck is with them; it will be advantageous to give them a little clover, hay, oats, peas, oil-cake, and to keep them at night in dry, warm sheds. It is well to give the buck a little extra grain or oil-cake separate from the ewes. Care and attention to the flock at this season, and during the winter, will be amply rewarded by an increased number of large and healthy lambs, and by more wool of a superior quality. Remember that warmth is equivalent to food, and that salt and water are essential to health, while regularity in feeding is very desirable.

Another writer, in the same paper, has well expressed an opinion we have long entertained, in reference to horns on sheep. We should extend the inquiry to all animals. Horns on the living are good for nothing but to wound and destroy. We, hence, go for *short-horns*, and eventually, for an improved breed with no horns at all. For wild animals, they are useful for defence; on domesticated, they are good for nothing. The writer referred to says:

There are two reasons which induce me to offer a few remarks to the farmer on the subject of polled sheep. One is, I believe a decided advantage may result to the wool-growing community from a consideration of the subject. The other is, I am now compelled to buy horned rams for a cross of blood, because I cannot get such polled ones as I desire, that are not nearly allied to my own stock.

I believe that nearly all middle and long-wooled sheep are polled, while the males of the finer-wooled varieties are usually horned.

I have for many years regarded horns on sheep in a domesticated state, as not only a useless, but a troublesome and expensive appendage; and in 1845, fortunately getting hold of a very superior polled ram, I commenced to try to breed a flock which should be hornless. I proceeded by not only selecting polled rams, but so far as practicable, perfect polled ewes also; and here let me remark, a ewe that appears to the casual observer to be without horns, is not always a perfect poll. There must be a cavity, instead of a fullness, where the horns usually attaches, or she cannot be depended upon to produce polled lambs with certainty, although the sire be polled.

The result of my eight years' labor is, I do not now have but one horned ram lamb in about ten or twelve; and I do not believe that I have sacrificed one iota in form or constitution, or in quality or quantity of wool.

Some of my objections to horns are briefly as follows:

1. The substance that goes to make horns, is the same that enters into the composition of wool.

2. If rams are polled, you may let all the pure-blooded ones run *entire*, to the age of one or two years, and then, any that are rejected as rams, will make as good wethers as if gelded while lambs.

3. Where horned rams run in a flock in summer, they are sure to fight, and if they do not kill each other outright, lose the skin about the horns, become fly-blown, and without constant care, more or less of them die.

A gentleman, who has been engaged in wool growing over twenty years, and who keeps near one thousand sheep, told me he annually lost enough rams from these causes to pay all his taxes.

4. Horned rams frequently strike ewes in the side, bruising them, loosening their wool, and occasionally causing them to cast their lambs.

5. You can shelter and feed about double as many polled as horned rams in a given space.

In conclusion, I would say I am always open to conviction. Has any one a reason why sheep in a domesticated state should have horns?"

two years old, brought \$1,000; one eighteen months old, \$3,500 and another, \$1,900, besides others at prices ranging from \$625 down to 300. Cows sold at \$1,425, \$1,300, \$1,000, down to \$205 each.

CAPITAL IN FARMING.

The merchant who, having occasion for a capital of ten thousand dollars in his business, should reduce it one half for fear of losing it, would be deemed unfit for his employment. If his capital, under his own care, paid twelve per cent., while in the bank it paid but six, he would hardly be thought sane, if he should change it. If, with his capital and labor, in the first case, he could make two thousand dollars annually; in the latter, he could make but one thousand,—a sum which would barely pay his family expenses and leave him nothing for the enlargement of his business.

Yet the folly, which is so transparent in the case of the merchant, is hardly noticed in the farmer. He flatters himself that, because he has made his income meet his expenses, he has lost nothing. He has conducted his operations upon a very prudent scale, because he has incurred no debt and all his investments are perfectly safe in the soil; though that soil has not paid him two per cent. above working expenses.

In nothing are our farmers more deficient, save in knowledge, than in the use of capital in their business. In very many cases they have not half capital enough, and in many more the capital is invested in the wrong place. A farmer with five or ten thousand dollars, is much more likely to invest the whole of it in acres, than in the materials to work his acres with, profitably. The old adage has been handed down, that "the soil will not run away," and he has implicit faith in its truth. This course is like that of the merchant, who should invest all his capital in a warehouse, much too large for his business, while he hired but a few hundred for his stock in trade. More than half the property of most of our farmers is in the shape of unproductive capital. The unused acres do not pay the taxes on them; and yet they would think it in the straight road to ruin to sell an acre, and invest its price in labor or manure, which would bring them in a large return, in less than six months.

Any man competent to manage a farm can make better use of his capital than to loan it at six or seven per cent. If all the wants of his farm are not fully met, and he lacks capital, he can afford to hire it at those rates, until they are met. It will be an injury to him not to use capital enough, just as serious as it is to the merchant, or to the mechanic. If he understands his business he is just as safe in hiring capital as any other business man.

It is good economy to use capital freely to stock a farm to the extent of its capacity. If you have pasturage for twenty cows, and milk but fifteen, you lose the profit of five. If the profits on a cow are ten dollars a year, you sink fifty dollars as palpably as if you threw it into the dock. You need all the stock your farm will support, in order to make manure, and to enlarge its capacity for future working. There are few farms that, with a judicious management, may not be made increasingly productive and profitable for some years to come.

The quality of stock, too, is to be regarded in the use of capital. It is much better economy to pay the value of a good milker, than to buy a poor cow at any price. Some are such miserable milkers, or the quality is so poor, that they will give you no profit.

The quality of seed for your crops is as well worth looking to as the quality of live stock. Hybrids and foulseed are not worth buying at any price. Clean grass seed, clean oats, wheat, and rye, sound, well-ripened corn adapted to your climate, are safe investments.

The farmers are not so deficient in these matters as they are in the employment of labor. It

takes money to pay *the hired man*, and money is not always to be had. "It will not do to hire too much help," is another of the old saws that tradition has handed down to us, in which there is supposed to be embodied a large share of the wisdom of antiquity. "It will not do to hire *too little* labor," is a saying quite as pithy and worthy of attention. A railroad contractor, who needed a hundred hands to finish his section in three months, would be a fool to employ twenty-five for a year, if his own time in directing their operations was worthy any thing. He could direct the labors of a small one. A farmer, who attends to his business in person, can lay out the work of ten men almost as easily as of two. If there is a profit on the labor of one man, there is ten times as much on the labor of ten men. Yet most of our farmers overlook this, and vainly endeavor to make their business profitable by employing one man to a hundred acres of land.

What would be thought of a merchant who had business for five clerks, and should try to get along with one? Would he not very soon have occasion to complain of hard times? Yet this is about the scale on which multitudes employ farm labor. The result is that few acres are tilled, and these are not half worked with the plow, harrow, cultivator or hoe. Agriculture is a poorly-rewarded business, and he is a happy son, who escapes from the drudgery of the New-England farm to the workshop or the counting-room.

Good tools is another safe investment for the farmer. Every one of our readers who works an acre of soil should not fail to visit some one of the Agricultural Fairs this fall, for the purpose of seeing the improvement in these implements. In this item alone, it will pay the expenses of a trip to Boston or New-York, Providence or Worcester, as the case may be. The best plow will save a great deal in horse or ox flesh, in the course of a season, and do its work far better, and secure better crops. It will not do for a farmer now, to overlook the cultivators and seed-sowers, the harrows, and other labor-saving implements, that offer their aid. Let him study their character and uses, and introduce them upon his farm without delay. Many of them will pay for themselves in a single season.

But, in nothing upon the farm, will capital pay a larger interest than when invested in manures, or in the material for their manufacture. "Fertilizers" is the great want of our hard-cropped New-England farm. The daughters of the horse-leech are not half so importunate in their cry of "give, give," as our hungry soils.

This is the cry of our mowing fields, that do not yield a ton to the acre. You may safely give them manure until they yield three tons. Here is an acre and three-quarters in sight from our window that has but nine tons of hay this summer, and it has not been plowed these twenty years. It is liberally dosed with stable manure, liquid and solid, every spring; and it pays back for all that is given. We tried an experiment with guano and super-phosphate of lime on mowing land, and, in the increasing yield of hay, got back the capital and more than ten per cent. profit.

This is the cry of our pastures. By the application of guano and super-phosphate of lime, they may easily be made to yield twice their amount of feed, and you may safely double your stock upon the same number of acres. On pastures at a distance from the farm, these are far the most economical dressings.

Every acre under the plow calls for more manure. No farmer should be satisfied till he gets at least his eighty bushels of shelled corn to the acre. Manure and good tillage will bring every cultivated acre to this degree of fruitfulness. By all means, employ capital enough to make the most of your stock in the manufacturing of manures upon your own premises. Secure labor enough to open that muck mine this fall, and, compost a few hundred loads with a quarter of its bulk of stable manure. Whoever does this, and carefully notes the results, we are

OHIO CATTLE SALE.—Thirty pure Short-horned cattle, the property of the Clark County Importing Company, were sold at auction at Springfield, Ohio, on the 6th instant. A bull,

confident will need no further exhortation from any quarter, to use more capital in farming.—W. C., in *Norwich Examiner*.

For the American Agriculturist.

HIDE FLESHING IS A MANURE.

ANIMAL manure is not appreciated according to its merits. Those who have tested it pronounce it superior to stable manure. Last year I buried at the foot of some grape vines, a quantity of fleshings of hides—which I obtained at a tannery—causing them to grow amazingly; far more than I had anticipated. They did not yield any fruit in consequence of their being lately set out. I also mixed some of the fleshings in the mold of the strawberry beds, and the fruit they bore was exceedingly large and plenty, so much so that it caused many remarks, particularly in regard to their size. This last spring I dug a number of holes, of some six or eight inches in depth, put in a shovel full of this animal manure, covered it with earth, and planted cucumbers and watermelons on top, which came up in nearly half the time that the others did not so planted, and looked more dark and rank. From what little experience I have had with animal manure, and also from what I have learned in regard to it, I would advise all farmers who can obtain a dead dog, calf, cow or horse, to bury a portion of their carcasses at the foot of their fruit vines, or trees. In so doing they will ascertain what its true merits are. Doubtless many of them have observed how flourishing and thrifty the grass and weeds will grow where the body of a horse or cow has, or is, decomposing. Test it for yourselves. E.

GATHERING INDIAN CORN.

MESSRS. EDITORS:—In your 27th No. of the new series, a correspondent from Virginia wishes to know among his numerous inquiries, how we Northerners harvest Indian corn so as to make the most of the stalks for fodder. I am aware of the difficulty that one will have to encounter to answer the question propounded, satisfactorily. There are many circumstances that would render a particular mode of harvesting Indian corn necessary in the northeastern States, that would not apply with equal force in Virginia. For instance, it is necessary in short seasons to so prepare the stalks that an early autumn frost will not injure either them or the corn, and it is also necessary that every farmer who keeps stock should provide sufficient fodder for his cattle to eat during the long cold winters. To do this, often occupies the farmers much of the best of the summer months. Neither of these circumstances have much bearing on a Virginia farmer. These two considerations have caused our northeastern farmers much anxiety; so much so, that many of the more observing have noted facts connected with the modes of harvesting corn, but they have not come to the same conclusion, although each feels sure that his adopted mode is better than any other.

Between the years of 1830 and 1847, I had opportunities of witnessing the result of numberless experiments in several of the Eastern States. Many were so conducted as to leave but little room for doubt as to their utility. My own experience, assisted with the above named facts, forbids the idea of a first-rate crop of corn, and a first-rate quality of fodder at the same time, although each may be fair or tolerably good. The reason is, that one is produced at the expense of the other. But if I wanted to make the most I could of both corn and fodder, and cultivated corn much north of New-York city, I would pursue a course nearly as follows:

First I would so manure and till the ground that nothing but the season should prevent my getting upwards of sixty bushels of shelled corn to the acre. Next I would let it stand, stalks

and all, until most of the ears were hard, and a few of the early ones quite ripe. The most expeditious way of shocking is, to let two men work in company, each with an instrument called a corn cutter. (Grain sickles are very much in use among the eastern farmers.) They each take two rows, and begin by cutting the first two hills of the inner rows. They clasp all the stalks in one hand while they cut them with the other. The clip should be struck in a drawing manner, not over four inches from the ground, at the same time bending the stalks slightly toward the body, as this assists the operation of the cutter. Then he should pass to the next hill, and so manage as to let his first cut hill lean against the stalks of the second, and at the same time pass the arm in a back-handed manner, so as to draw the uncut with the cut stalks under the arm, and at the same time strike as before, which gives him two hills, and his partner having two hills of stalks, each should raise his cut stalks and move them into the space ahead of where the second hills stood. Let the lower ends spread so as to brace each other, as they are let lean together at the top. They should then step back, and in like manner cut the first two hills of their outside rows, and set the stalks against the first set up, and then each cuts two hills more from each row and brings back to the shock, and sets them up so as to strengthen the shock. One now selects a band from some one of the barren stalks, while the other gathers the tops together as near the top as is possible to hold the stalks up, and then the band is fastened. Care should be taken to so place the lower ends of the stalks that a free circulation of air might pass through the stalks, and thus dry them. This gives sixteen hills to a shock, and the shock stands in the center space of the sixteen hills. It should so stand until the fall rains commence, when, in dry weather, enough should be taken under cover to keep the hands at work husking the corn through the wet days. The fodder should be so kept as not to get entirely dry, nor allowed to mold, as either is an injury. Many pile it up mixing their wheat straw with it and thus improve both.

I have seen corn harvested in a great many different ways in the Eastern States, and the fodder cured in different ways, too, but when both are an object, the above is the most expeditious as well as economical. The entire stalks are very good fodder when thus cured; and as they are not a quarter so large nor half so hard either, they dry much quicker, and therefore in all respects, easier to manage than the stalks of such corn as I have seen growing in Virginia. There are many methods in practice among the northern farmers; too many to detail.

Morristown, N. J.

J. H. D.

For the American Agriculturist.

DEEP PLOWING AND MANURE.

As I now look over a portion of the Mohawk flats and on the sides of the contiguous hills, I can see that vegetation is making rapid progress. The luxuriant grass and towering pines that grow there, are indebted to the earth for their sustenance. Deprive them of mold, how soon they die; but enrich the earth, and how astonishingly fast they grow. As the earth supports nearly all plants, how exceedingly judicious we should be in the management of our land. There is nothing that presents a subject of such vast importance to the human race as this; it can be classed with those that are the most difficult that can be discussed. As plants are perpetually confined to the same portion of earth, by being destitute of the faculty of locomotion, they are compelled to seek for that proper aliment indispensable to their growth, in that ground in which they chance to be located. Consequently how requisite it is for the ground to be loose, so that the roots can freely extend, for the purpose of supporting the plant by extracting the nourishing juices of the soil. This

condition of the land is indispensable to profitable farming. Deep plowing is advantageous to that land where the top soil is too compact or clayey—immediately subjacent there is a layer of sand or other light soil; for, by allowing the plow to run deep, the soils are in a measure mixed together, thus rendering one loose and the other more compact. It is also useful to the soil which possesses a uniform character to a considerable depth, to turn up a portion of it which has been made fertile by the nutritious substances, that have been carried down by rain and melted snow.

Farmers are generally laboring under one great hallucination by being destitute of the knowledge of the nature of their land. To obtain this knowledge we must resort to experiments or chemical analyses. I prefer the former; still I value the latter, for it tends to suggest proper experiments. Arable lands are generally composed of lime, alumina, silica, magnesia, oxyde of iron, and saline substances. According to the various proportion of these ingredients arises the diversity of soils. When these ingredients are rightly proportioned, the relative degree of fertility depends on the quantity of vegetable and animal substances that are mixed with them. As a general thing, there is an insufficiency of these two manures in our land. Consequently the effect of barn-yard manure is exceedingly propitious, nevertheless many of our farmers are so consummately negligent, or inadvertent, as to allow it to be thrown from their stables in places exposed to the drenching rains of spring, and it receives frequently all the summer showers previous to its being applied to the land, thus losing nearly one-half of its intrinsic value, much to the detriment of the husbandman. It is universally admitted that continued cropping impoverishes the soil, particularly when it is not abundantly manured, for each crop diminishes the quantity of vegetable and animal matter, and, if long continued, completely exhausts it.

A FARMER.

THE WHITE DAISY.

Of all the pests that afflict the farmer, none I deal with better deserves the appellation, *intolerable*, than the White Daisy. The seed is long, slender, brown, and the rapidity with which it spreads demands of the farmer the most untiring diligence in its extermination. The moving of hay in winter, has seeded the road-sides of this town, and they now present, for miles, a bordering of daisies. From a few seeds sown when laying land down to grass, we have whole acres now thickly in blossom.

The rapidity with which the daisy increases, may be seen from the following. I to-day pulled in my meadow a stool probably three years old, from which had grown 26 stalks, bearing fifty-one blossoms. I counted 300 seeds in one blossom. Another stool has sixty stalks, and at above rate over one hundred blossoms. Putting the number of seeds per blossom at 200, we have for the last stool 20,000 seeds; and for the first 10,200. From a little plot of ground, about four feet by five, I pulled 650 stalks, giving at above rates, 1,000 blossoms—200,000 seeds.

Need more convincing proofs be added, to prove to the most negligent farmer the necessity of being wide awake in the work of eradicating these pests?—and yet we see farmers resting in quiet ease, year after year, while they are gaining a foothold, and increasing in a ratio of unexploded rapidity.

Remarks by the Editor.—We find the above communication in the Rural New-Yorker, published at Rochester, and commend it to farmers in Pennsylvania. Throughout this whole region the Daisy appears to be on the increase, and unless a general effort is made to eradicate it, it must go on spreading, and injuring the land and the crops. The best mode to exterminate this vile plant, is thorough cultivation before the ripening of the seed. When this is inconveni-

ent, going over the field, fence-corners, and wherever they abound, cutting off the flowers or tops with a scythe, will do the work if pursued two or three years carefully. We never, in all our observations, saw a farm so thoroughly free of weeds as the Highland Farm of the late George Sheaff, Esq., in Montgomery county, and the measure he adopted was to top all troublesome weeds before the seeds matured. Some few, as dock, will have to be taken by the roots.—*Germantown Telegraph.*

TREATMENT OF BROOD MARES.

In the Patent Office Agricultural Report of 1852 and 1853, there is a communication from Mr. J. L. Balthorpe, of Salem, Fauquier, Co., Va., from which we make the following extracts:

The cost of rearing a colt until three years old.—A good colt at weaning—say four months—is worth twenty-eight dollars; first year's keeping, twelve dollars; second year, fifteen dollars; next twelve months, fifteen; which will bring the colt to three years at a cost of seventy dollars. Average value at that age, ninety dollars.

Treatment of brood Mares.—Having owned a stallion for several years, I have observed that mares are much surer to prove in foal when not suffered to run on red clover, or any sappy grass; if the season is wet, it is best to keep them on dry food, until the time the horse's service is past. There is no objection to their being used, but they should always be used with a great deal of care, never overdone with heat or fatigue. When they have gone some eight or nine months, they should be kept apart from other horses, or at least see that that they are not kicked or jammed by them; and when they are within a few weeks of foaling, it is well to turn them on a meadow or grass lot that is clear of ditches or abrupt streams, as mares are naturally inclined to foal near a stream of water; and I have more than once known colts to be lost by being dropped in, or so near a branch, that they have fallen in before they were fully able to walk.

POSTERIOR INVENTIVE GENIUS.—Mr. John M. Ware, of Seabrook, N. H., has recently obtained a patent for holding cow's tails still during the operation of milking. The machine is fastened to one of the animal's hamstrings, and the tail is compressed. Mr. Ware politely styles his discovery the Milker's Protector. His claim is as follows: "I claim the Milker's Protector, constructed as specified, viz.: a combination of ham-strings and tail nippers, applied together and made to operate as described." This is, in one sense, a step backward in science.

THE RICE CROP.—We are assured on authority entitled to great confidence, that the loss of the rice crop on the Savannah and Ogeechee rivers, by the storm of the 8th inst., will be fully three-fourths; on the Altamaha about one-third; and on the Satilla nothing. On the rivers between Savannah and Charleston, the probable loss may be estimated about half.—*Savannah Georgian.*

PULSE OF VARIOUS ANIMALS.—The pulse of several of our domestic animals, as given by Vatl, in his Veterinary Pathology, is nearly as follows: Horse, from 32 to 38 pulsations per minute; ox or cow, 25 to 42; ass, 48 to 54; sheep, 70 to 79; goat, 72 to 76; dog, 99 to 100; cat, 110 to 120; rabbit, 120; guinea pig, 140; duck, 135; hen, 140.

THE CORN CROP.—The Worcester Spy says that the corn crop in Central Massachusetts, will be nearly or quite an average one. Potatoes will be quite light.

A FAMILY OF SIX.

THE Dayton, Ohio, Gazette—on the authority of "an eye witness, a lady of character," of that city, "who saw and counted the children, and had the mother's word that they were all hers, at a single birth"—gives an account of six babies that lately passed in charge of their mother, a German woman, through that place, to visit their paternal parent in that vicinity, who had been taken sick at a place where he had been employed at work.

"She had with her in a wagon, snugly propped in a wine basket, the six children. They were not much bigger than apple dumplings, but seemed to be wide awake and kicking. They were six months old, all boys, and all as near of a size as possible, except the runt of the party, which is described as being the smallest mortal, of its age, ever seen."

The same paper goes on to say that while there are many well-attested cases of five children, there is but one case recorded of six at a birth, and about this there is much doubt. It happened in the day of Dr. Pare, an eminent French surgeon and writer of the year 1590. The mother, who was the wife of Lord Malde-mere, died after delivery, and but one of the children lived, succeeding to his father's title and estates.

There is a legend that a Guelph ancestress to the present Queen of England had twelve children at one birth, but, although credited by the faithful, this is, of course, not generally believed.

This German woman, with her six simultaneous infants, should visit the "baby show" which was last year appointed to come off at Springfield the present fall. She would, undoubtedly, take the highest prize if quantity entitle her to it. * * * * *

In Cuba the goats are employed as wet-nurses for infants, evincing much maternal care and affection for the "wee ones" entrusted to their charge—running to them when they cry, leaping upon the bed to give them sustenance, and freely using their horns upon any one that molests them. If the same custom were adopted in some of our American cities, instead of using the milk of diseased and drunken cows, fed on the refuse slops of distilleries, the bills of mortality would show less deaths among our younger population. Lest there should be some difficulty in getting the requisite number of new milch goats, it would, perhaps, be safer for them to remain in the more healthy locality of their birth, where pure milk is to be obtained, till after they are weaned. Till then we hope the Dayton Gazette will have an eye to this remarkable brood, while we congratulate the parents upon their promising prospects of having a family.

Napoleon, in reply to Madame de Stael, said that she was the greatest woman who was the mother of the most children, and he would probably have conferred on this mother, special honors, and upon the father the order of Legion of Honor. Sir Isaac Newton, at his birth, was so small as to be placed in a pint cup, head and shoulders; and there is no knowing what these little ones may become.—*N. Y. Times.*

We can make a better suggestion than goat's milk. Send down East for one of that man's famous Devon cows, which he says, makes a pound of butter from every four quarts of milk. If the babies could drink such rich milk as this, we have no doubt it would expand their puny proportions so rapidly that they would grow up to be the Brobdinags instead of Liliputians of the land.

THE WHEEL ANIMALCULE.—Ehrenberg, from actual observation, found that the rotifera laid four eggs a day—that the young, when two days old, followed the same law as their parents; consequently, a single one in ten days had a family of 1,000,000, in eleven days 4,000,000,

of an active, happy, and energetic race—ceaseless in search of prey, and a famous feast for a larger animal. The rotifera delight in the sunshine, and when the bright luminary is hidden behind the clouds, the animals sink down to the bottom of the water, and there remain. When their haunts are becoming much evaporated, they rise to the top, and give a bright red tint to it; but when caught and placed in a jar, their beautiful color fades in a few days. Locomotion is performed by swimming, the rotary action of the crowns of cilia impelling it forwards; in other instances it bends its body, then moves its tail up towards the head, which it can do from having two processes that act as feet, near to the tail; it then jerks its head to a further distance, again draws up its tail and so proceeds on its journey. Another peculiarity they possess of drawing in the head and tail until nearly globular, from remaining in this condition fixed by the sucker; at other times they become a complete ball, and can be rolled about by any agitation in the water.—*The Microscope.*

MACHINERY vs. FINGERS.—There is no danger that fingers will ever prove superfluous, or stout bodies seem unnecessary. Fingers will always be handy to reckon on, and muscular power will assist in making the effective gestures at a stump speech. But for the old uses, they are certainly to be in less demand hereafter. We have preached, exhorted, written editorials against the habit our girls have fallen into, of neglecting their knitting and sewing, to spin street-yarn and read novels. It has not proved of much use. So stockings are knit by looms now, and the sewing-machines are constructed to sew better, stronger, more evenly, and much steadier, than even our model daughters could. Our mail carriers loitered to tell stories by the way. Our post-boys stopped to trade horses on their route. So the telegraph was invented, and the lightning, which has no voice, except a kind of thundered Dutch, has the contract; and now a man of sedentary habits, at each end of a wire that may be any thing but endless, will do the work of hundreds of steady post-boys, and as many \$200 horses. Jonathan is hard to suit. He grudges the time of his boy—who ought to be at school—that has to feed the machine which does a hundred men's work. We went a day or two since to see Wilkinson's "Endless Register"—a printing press that feeds itself, cuts the sheets as they roll, lays them straight when printed, and carries them away. The next step will be to build an automaton type setter—that will follow copy to a dot. Then a Society for the Diffusion of Useful Knowledge must be sure to keep on hand a supply of cheap books, for the use of the poor lad, who has the dull job of winding up the Automaton Type Setter, and seeing that the printing press does not strike off extras unordered, that the boy may improve his mind during the long leisure of his appointed ten hours labor.—*N. Y. Times.*

S. M. BAKER, a Pickaway farmer, has owned during the past year, upwards of three thousand cattle; his capital actively employed in this business being something over \$150,000.—*Cincinnati Commercial.*

ENGLAND LEARNING FROM AMERICA.—A correspondent of the Boston Chronicle says that the Massachusetts Arms Company, at Chicopee Falls, are now constructing for the British government a complete set of machinery for doing gun work. The machines are modelled from those at the arsenal in Springfield, which every one who has visited there has seen to their astonishment and admiration.

THE number of hogs assessed in Kentucky this year is 1,515,690, being an increase over last year of 185,307 head.

Horticultural Department.

TEA.

THE tea plant is a pretty shrub, growing from two to five feet high, though unmolested, it is said to attain the height of thirty feet. It is cropped down every season, so that the new shoots may produce a great quantity of leaves. It is planted in rows like hedges, and in hills like corn. The blossoms look and smell like those of the apple tree. Each shrub produces from five to ten ounces. All the varieties are comprised under two kinds, green and black tea, which differ from each other only as they are gathered early or late in the season. Tea gathered early is better, the young leaves having a stronger and richer flavor. The great number of varieties arises mostly from differences in manufacture or preparation—a few only from mixing and scenting. In America, we are apt to suppose Hyson, Green, Black, Souchong, &c., so many distinct kinds, whereas there are only two kinds, Green and Black.

Nongyong receives its name from the place where it grows. Bohea, so called because it is raised on two hills of that name. Being gathered after the rains, and latest, it is the poorest kind of tea. The time of gathering Green tea is in March, April, or May, and that for Black tea is in June, July, or August.

Good tea is raised in Java, Sumatra and Hindostan, as well as in China. In point of soil and temperature, it would probably flourish as well in the United States, but it can never be cultivated with profit till the price of labor is greatly reduced.

SEEDLING PELARGONIUMS.

ANY of our readers who have the curiosity can call and examine the colored plates of the beautiful flowers described here. We cannot give them in our publication, and common ink engravings would convey no idea of their resplendent coloring. The largest of these specimens are two and a half inches across the petals. They are the most magnificent specimens we have seen within our recollection.

We present our readers this month with a double plate, representing some of the new varieties of our three largest raisers, Messrs. Foster, Hoyle & Beck, and which are to be sent out in the autumn of the present year. In spite of some severe remarks from the editor of the *Gardeners' Chronicle*, this flower has lost none of its popularity, and we doubt if it was ever so largely or so well cultivated as it is at the present time. Indeed, we have heard that several leading nurserymen were unable to supply the demand for the best varieties during the past season; and from the inquiries for lists of the superior sorts addressed to ourselves, we are quite satisfied that raisers of seedlings have only to go on and prosper. One thing we would earnestly impress upon them, and that is, to use every means in their power to increase the varieties of color, a thing much required in a first-rate collection. It should always be borne in mind that contrast is necessary to produce effect, and that brilliancy loses half its claims to our admiration if it has nothing to relieve and set it off. We know from experience how difficult it is to obtain some colors in combination with good habit of plant and bloom. Year after year we have had intensely bright color—rich purples, the deepest maroons, &c.—and yet accompanied by faults of such a charac-

ter that we could not propagate—could only seed from them, hoping in time to get all we required. We are always encouraged when we meet with desirable color alone, because it tells what is in store for him who does not allow himself to be disheartened, but perseveringly proceeds with a determination to succeed. We would add that, with every care, it is impossible for the artist to give the exact colors of nature. In the present instance the drawings were made from the plants, and we trust our readers will see the latter all frequently exhibited in the winning collections of next season.

In another page Mr. Beck has supplied a short account of the flowers raised by him, and now in the hands of Dobson and Son.

As regards the two varieties figured in Plate 92, they are both free bloomers of good habit. Both flowers took first-class certificates at the National Floricultural Society, on which occasion the following description was taken of them:

"Phaeton: A rich orange scarlet, stout, smooth, and of good form; also a free bloomer."

"Wonderful: This is a large flower, of the finest form, with smooth stout petals. The top petals are dark maroon, shaded off to the margin with orange and rose. The lower ones are deep pink. Large white centre."—*London Florist and Fruitist*.

CARRYING FRUIT TO MARKET.

BUT few days pass at this season of the year, during which may not be witnessed at any of our market-towns, the effect of carelessness in carrying fruit to market. It is well known to all salesmen that, be their wares what they may, the better their appearance, the better will they sell. This fact seems to be entirely overlooked by farmers when carrying their produce, and more especially fruit, to market.

For instance, a farmer having early apples for sale, will shake them from the tree, pick them up, bruised and all, throw them into the box of a lumber-waggon, and drive them eight or ten miles at a snail's pace, and over a rough road. Upon arriving at his destination he finds them bruised, discolored, and withal, looking far more fit for consumption by swine than for human use. The next effort is to sell them, and in this branch of the operation the results of his heedlessness are soon made manifest. It is only after a great waste of time and words that he succeeds in disposing of them, and then but for a mere trifle. It is no marvel that he goes home in a state of mind no ways enviable, finding fault with every body, and every thing, apple-buyers and apples in particular, and ending with a resolution to let the trees take care of themselves in future.

Had this man (who by the way is but a fair specimen of the majority) picked his apples carefully, put them in baskets or barrels, and driven slowly to market, a quick sale and high price would have rewarded him in full for his care and attention. Nor would these be the only benefits arising from such a course, the purchaser would be well pleased with his bargain, and a great saving would be made in the time and temper of the farmer. Finally, and best of all, he would return to his home with a firm determination to take the best of care of his trees.—*Dollar Newspaper*.

FRENCH GARDEN IMPLEMENTS—STONE—LABOR.

I SOMETIMES wonder that any thing grows in France, the tools used in gardening and in agriculture are so uncouth and unhandy. The hoe, an instrument of constant use, has a handle but two feet long, so that the hoer is obliged to bend into the very earth, in order to reach the object of his care. He thus has his back continually horizontal—a position as laborious and painful as it is degrading, for it gives to a man the appearance of a beast of the field, crawling on all fours. The French spade is even worse.

The handle is straight, like the American hoe; it is not furnished with a hand-piece at the end, which at home is thought to increase its efficiency two-fold. This tool is a monstrous misapplication of strength to labor, and, as might be supposed, performs very small days' works. In fact, the spade and the shovel are both one, whereas they ought to be as distinct as poker and tongs. The rake, an ornamental instrument at best, is furnished with nails in the place of teeth; but as it is often double, being a rake on both sides, it is a tolerably vigorous utensil. The watering-pot, on the other hand, is a superior article. It is constructed on mechanical principles. The two handles—the carrying and the watering handles—form but one handle, passing along the top to the side. The gardener thus slides his hand from the one position to the other, and may hold a watering-pot in each. The wheelbarrow is an ill-built affair, and usually creaks. The mortar used in the construction of stone walls is the best in the world. In two hours it is harder than the stones it cements, and never, at any age, does it crumble to pieces. It is expensive, and even the wealthiest proprietors resort to the following expedient to diminish their consumption of it. At every twenty feet of the wall to be built, a fragment of it—say a portion two feet wide—is made with mortar, the rest is cemented with mud—the commonest mud, made upon the spot, with any earth that happens to be at hand. The whole wall is then faced with mortar, thus assuming a similar appearance in its whole length. The result is a wall that will last for centuries, there being no frosts powerful enough to upheave or disjoint it.

I said the mortar was stronger than the stone. No one who has ever seen French building stone, in the neighborhood of Paris, can form even a remote idea of what it is. The masons snip it, shape it, edge it, as if each lump were a pine-apple cheese. I have seen the adze penetrate a block as it would have penetrated a ripe water-melon. This quality, which adds to the facility with which it is adapted, is in no way disadvantageous. The stone will bear any weight, and never splits or chips of its own accord. With time its color changes from a rich cream color to a dingy brown, but a scrape every five years restores it. Its softness is in fact as great an advantage as malleability is to a metal; for while it is as easily fashioned as cheese, it is as durable as granite.

I told you that I once hired an old woman to weed a gravel path and strawberry bed. I am happy to state that this venerable creature is now well provided for. She and her good man are engaged as husbandmen upon a neighboring farm. They work twelve hours a day, steadily, and she performs the same labors, and quite as much labor as he. She digs, weeds, plants, "snatches" potatoes, trains grape-vines, mounts drays, ascends ladders, gets into trenches, sinks wells, like the vilest male of them all. I sat the other day upon a hay-cock of her making. She is richly bronzed, and her limbs—which she exposes with an agricultural freedom—are gnarled and knotted to a degree quite unusual with the sex. The two are boarded and lodged by their employer, and the wages they get are proportionately reduced. Still, the smallness of the figure will astonish you as it did me. They earn, together, \$180 a year—being thirty cents a day for him, and nineteen cents a day for her. They lay by \$100 a year, and when they are too old to work, will be able to keep them out of the poor-house and avoid the hospital, even though saddled with sickness in addition to poverty.—*DICK TINTO, in N. Y. Times*.

THE *Sky Larks* imported from England to the State of Delaware, have greatly multiplied, we learn, and are daily heard over a track of six miles in extent.

American Agriculturist.

New-York, Wednesday, October 4, 1854.

GUIDE TO NEW-YORK CITY.

TALK ABOUT NEW-YORK CITY, AND THE
GREAT AGRICULTURAL SHOW.

WITH A MAP OF THE CITY.

Minute Directions to Strangers as to Points of Arrival—Conveyances in the City, with regular fares—Omnibusses—City Rail-Roads—Carriages—Baggage Expresses—How to get to the Show Grounds—European, and other Hotels—Boarding-Houses—How to visit the Crystal Palace, Greenwood Cemetery, Navy Yard, &c., &c.

On the opposite page we have given a condensed map of the business portion of New-York City. A study of this would be interesting at any time, for there are more people on the small plot represented by this map, than there are in each of half of the smaller States in the Union. Indeed, leave out the States of New-York, Pennsylvania, Ohio, Virginia, Tennessee, Massachusetts, Indiana, Kentucky, Georgia, North Carolina and Illinois, and there is no state to compete, as to the number of inhabitants, with this little plot of ground two by four miles. But we give this map, and a few directions, now chiefly with reference to the great Agricultural Show, which commences here on Tuesday next, (Oct. 3.) In a former number (vol. XII, page 218,) we gave some directions to "Green visitors in New-York," and to save repetition we advise those who are "green" to turn back and read them before coming to the Show.

In New-York most of the streets have their names posted upon each corner, so that a stranger need be in no fear of losing the name of the street; for he is generally in sight of a guide-board. Now by taking a map in his hand he can trace out his course to almost any point he may desire.

Before describing the map, we wish every reader to mark particularly the reference spaces or squares. Across the map from left to right are spaces divided off by horizontal lines. These spaces are numbered with figures 1, 2, 3, &c., or 1*, 2*, 3*, &c. There are other divisions extending from the top to the bottom of the map. These are marked with the letters of the alphabet, A, B, C, &c. Now it is easy to point out any place on the map by simply giving the figure for the cross divisions, and the letter for the perpendicular divisions. Thus 5.E, points out the square where the 5th division or row of squares crosses the E division. Looking for 5. E, you will find Washington Square marked on the map. In the square 10.C, you will see the word "PARK" written. 3*.H, points out the Crystal Palace; 12.D, the location of the *American Agriculturist* office; 13.A, the Battery, &c. In another place we give an alphabetical list of some of the principal points of interest, including hotels, &c.

GENERAL DESCRIPTION OF THE CITY.

New-York is situated on an island about 14 miles long, formed by the Hudson river on the

west, the East river (an extension of Long Island Sound) on the east, and the Harlem river on the north. About 4½ miles in length of the Southern part of the island are represented on the map. As will be seen, the Hudson and East rivers, run together at the Southern extremity, forming the New-York Bay, which reaches out to the ocean at Sandy Hook, some 20 miles from the Battery or lower end of the city. The northern half of the island is narrow, somewhat hilly, and in several places is covered with rocks and trees. From the line of squares marked 3* to the Battery, (13.A,) there is a dense mass of buildings, broken only by streets and an occasional public square, or a vacant lot. The arrow upon the left of the map (in 2.A) points to the north, and will show the direction of the streets. It will be seen that Broadway runs nearly from southwest to northeast, between the Battery and Fourth street, which is a distance of 2½ miles.

POINTS OF ARRIVAL IN THE CITY.

FROM THE WEST.

Those coming by the Camden and Amboy, and by the New-Jersey Central railroads, land at the piers just west of the Battery, 13.A.

Those from the New-Jersey, the Morristown, and the Patterson railroads, land near the foot of Courtlandt street, 11.A.

Those coming by the Hudson River boats, land at different points in 11.A, 10.A, and 9.A.

Those from the Erie railroad, land at the foot of Duane street, 9.A.

FROM THE NORTH.

Those by the Hudson River railroad leave the cars in Chamber street, near the southeast corner of the square 9.B. They can also leave the cars at the corner of 31st street and 11th avenue in 3*.C.

Those coming by the Harlem railroad, leave the cars at the northeast corner of the Park, 10. D, or at 27th street in the 4th avenue, 1.H. They can also leave at several points between. During the Show, passengers by the Harlem road can leave the cars at 66th street, within a few feet of the Show Grounds.

FROM THE EAST.

Those coming by the New-York and New-Haven railroad, leave the cars at the corner of Canal street and Broadway, 8.D. They can also leave at 32d street in 4th avenue, in the lower right hand corner of 1*.H.

Those coming by the New-Haven or Connecticut river steamboats, land at the foot of Peck Slip, 12.E. The 2d avenue railroad, will take them from this point to 66th street, within one square of the Show Grounds.

Those coming by the Long Island railroad, leave the cars in Brooklyn, at the ferry, which takes them over to the east side of the Battery, about the center of 14.B.

Passengers by steamboat from Norwich, Stonington, and Fall River, are landed on the west side of the city, in 12.A.

We have given the landing places of passengers from the routes from a distance. There are a large number of local steamboats, but those coming by these are generally acquainted with the city.

With the above directions, and by referring to the guide upon the margin of the map, strangers can usually find their way to any part of

the city. We will, however, describe some of the ways of

TAKING CARE OF BAGGAGE.

BAGGAGE EXPRESSES.—On most of the railroads a baggage express agent passes through the cars before they reach the city, and takes the baggage checks from such passengers as desire. If you give him your check he will deliver your baggage any where in the city, charging 25 cents for each trunk or bundle. After giving him your check you need take no further trouble about your baggage, but to look for it in the course of an hour or so at the place you have directed it to be sent. None but reliable men are admitted upon the cars on this business.

MEANS OF CONVEYANCE WITHIN THE CITY.

There are two principal starting points from which a person can take a public conveyance to almost any part of the city. These are the South Ferry just east of the Battery, 14.B, and the lower end of the Park, 11.C.

OMNIBUSSES.

From the South Ferry, several lines of omnibusses start up Broadway, Bowery, and the different Avenues, (which are wide, straight streets, running in a north and south direction through the entire upper part of the city. They begin with 1st Avenue near the east side, and number to the west, where we see the Tenth Avenue beginning in 2.B.) The route of each omnibus is plainly written upon the outside. The fare is six cents for any distance, long or short, within the city, to be paid to the driver before leaving the omnibus. Two or three lines charge less than six cents; these have the rates, 3 or 4 cents, put upon a card always plainly to be seen. The omnibusses take up and set down passengers at any point on their route, which they never leave. There are several lines of omnibusses starting from Fulton Ferry, 12.D, and from other points.

CARRIAGES OTHER THAN OMNIBUSSES.

At every landing place there are always a number of carriages, which will take you to any point in the city. The charge on these fixed by law is, for one passenger, one mile or less, 50 cents; for two passengers 75c., and 37½ for each additional passenger. For more than one mile and less than two, the charge is 75c. for one passenger, and 37½c. for each additional person. Each passenger is entitled to carry one trunk or valise, and the charge is 6c. for each additional piece. It is usually better to arrange the price before entering one of these carriages.

CITY RAILROADS.

There are five railroads running north and south through the city. The cars are drawn by horses, and they take and leave passengers any where on their route. The fare in these cars is five cents for any distance within the city.

SECOND AVENUE RAILROAD.

The 2d Avenue Railroad commences at Peck Slip, 12.E, (at the line marked in the map E, R, S, B) and extends through Pearl and Chatham streets, through the Bowery to Grand street, (in upper part of 9.E,) thence a short distance east through Grand street to Allen street, up Allen and 1st Avenue to 20th street, then into 2d Avenue and up 2d Avenue to Yorkville, about 86th street. These cars pass within one block of the Show Grounds, on 66th street.

Union, 3.F
St. John's, 8.C
Thompkin's, 6.I

Entered, according to Act of Congress, in the year 1848, by HOLBROOK AND BARTLETT, in the Clerk's Office of the District Court of the Southern District of New York.

THIRD AVENUE RAILROAD.

The 3d Avenue Railroad extends from the lower end of the Park, 11.C, through Oatham, street, up Bowery, into 3d Avenue, at 6.F, and up this avenue to 86th street. These cars pass along the east side of the SHOW GROUNDS.

FOURTH AVENUE RAILROAD.

The 4th Avenue Railroad also begins at the lower end of the Park, 11.C, and extends up center street to Broome, 8.E, through Broome into Bowery, up Bowery to Union Square or Place, 3.G, and thence up 4th Avenue to 27th street, in 1.H. The horse cars do not go farther

up, but during the Show, persons can take the long cars on the track at the northeast corner of the Park, and be landed at the Show Grounds. These long cars are drawn by steam above 27th street, and the fare will probably be a trifle higher than in the horse cars on the other roads. It will not exceed 12½ cents.

SIXTH AVENUE RAILROAD.

The 6th Avenue Railroad has two lower branches, the one leading from the corner of Canal street and Broadway, in 8.D, and the other from Barclay street, just west of the Park, 10.B. The two branches meet in Canal street, and the track continues through several short streets till it enters the Sixth Avenue in 5.D, and up this to the Crystal Palace in 3*.H, which is as far up as the cars yet run on this road.

EIGHT AVENUE RAILROAD.

The cars on the 8th Avenue Railroad (which are painted red) start at the same point and run over the same track as the (white) Sixth Avenue cars, but branch off to the west and go up through the 8th Avenue, which begins in 2.D.

HOW TO REACH THE SHOW GROUNDS.

To REACH THE SHOW GROUNDS from any landing place, it is only necessary to strike somewhere upon the track of second, or third Avenue railroads, or the long cars standing upon the 4th Avenue at the northeast corner of the Park. From most landing points it will be best to go directly to the Park. A number of the hotels are near the Park, and as before stated, the 3d and 4th Avenue railroad cars leave this point. By going a little way up Chatham street to Pearl street, (in the lower right hand corner of 10.D,) you can take the 2d Avenue cars.

HOTELS, EATING-HOUSES, AND BOARDING PLACES.

Upon the left side of the map we have given the names and locations of some of the principal Hotels. There are, however, a great number of others not there named. You will find plenty of "runners" who will with great vehemence urge the claims of this and that hotel, but it is safer to *pay no attention* to any of these, for, ten to one, the most miserable liquor shops will have the most vociferous "runners."

EUROPEAN HOTELS.

At the *European Hotels* you can secure a room for a day or week, for which the usual charge is 50 cents per day. Connected with these is an eating house, where you can get whatever you like, paying a small sum for each article called for. The price is always given on a printed "bill of fare" which lies upon each table. In this way you can get a plate of steak including potatoes and bread, for 6 or 12 cents, a cup of tea or coffee for 3 or 6 cents, and other articles at a proportional rate. Most of these Hotels are designed for gentlemen only. You can take ladies with you to Savery's Temperance House, which is on Beekman street, adjoining the office of the New-York Times. On the map you will find its location near the center of 11.C, just above the word "Ann." The Eagle Hotel is only kept as a lodging house, containing a great number of small rooms, which are let for 25 to 50 cents per night.

The other Hotels not included in the European, charge so much per day for rooms and meals; usually no deduction is made for absence from meals. The Astor House, St. Nicholas, Metropolitan, New-York, and Prescott Hotels, charge \$2.50 per day we believe. The others charge \$2—some of them less. See *Advertisements on page 61*.

Very good meals or lunches can be obtained cheaply at numerous eating houses, where a

printed "bill of fare" gives you the price of any dish you may desire to call for.

There are a great number of *Boarding Houses* all over the city, where you can get lodging and board for 75 cents to \$1.25 a day. For the locations of these we must refer you to the advertising columns of the different newspapers.

CRYSTAL PALACE.

You will of course visit the CRYSTAL PALACE one day at least. It can be reached by the Sixth avenue railroad for 5 cents, and by omnibuses from every part of the city, for 6 cents. All lines of omnibusses running to the Palace are so marked, and you have only to get into one of them going north, and state to the driver where you wish to be left.

OTHER PLACES OF INTEREST.

While in the city you may wish to visit other places of interest, besides the Show and Crystal Palace.

We have marked the location of several of these on the margin of the map, and you can easily find them without further directions.

GREENWOOD CEMETERY.

To reach GREENWOOD CEMETERY cross the Fulton Ferry, 12.D, for 2 cents, and you will find at the Brooklyn landing, (13.F,) a car marked "Greenwood Cemetery via Court street." Step into this and you will be taken to the gate of the Cemetery, 4 miles distant, for 4 cents. This is a pleasant trip which takes you through the south part of Brooklyn, and along the New-York Bay. Before starting, however, go to the cemetery office, No. 53 Broadway, (12.B,) or call upon any undertaker, and you can get a *free ticket* of admission to the grounds. Many strangers neglect this, and lose their journey to Greenwood. The precaution of requiring tickets is necessary to keep out gangs of loafers and rowdies.

NAVY YARD.

The NAVY YARD, (13, 14.J,) will well repay a visit, and is always open to visitors. To reach it cross the Fulton Ferry, and take a car running through "Sands street," and the Conductor will direct you to the Navy Yards. Public works being the property of the citizens, are generally open to the inspection of the *owners*.

DOWN THE BAY.

To see the shipping, &c., those having two hours of spare time, should go down to the east end of the Battery, 14.B, and take a trip on the Staten Island steamboat. This will give a five miles' sail down the bay, and one which it is well worth while to make. The fare is only 6 cents each way. You can go and return on the same boat. We have not room for further particulars.

For the American Agriculturist.

RECIPES.

ONE of the best housekeepers in Morristown, N. J., sends us the following:

MOUNT SAVAGE BREAD.—Take one large tablespoon of yeast, put it to soak in a half pint of warm water at four o'clock P. M., the day before you bake. When soft, mix it with wheat flour to the consistence of a thick batter. Let it stand until light. Take half a dozen medium sized potatoes, boil and rub them through a colander. Take one quart of warm water and mix your sponge, adding the potatoes, and some salt, making a thick batter. Let it stand over night.

In the morning add one egg well beaten, one and a half large spoons of pulverized white sugar, and a piece of butter the size of a black walnut. Knead it well and let it rise. When light, mould it and let it rise again; repeat the same two or three times, the oftener the better. Bake in sheet-iron pans, 10 by 14 inches, and 3 inches deep, making six loaves in each pan. When you take it from the oven, rub the top of the loaves with butter in a cloth.

MOUNT SAVAGE YEAST.—Take a double handful of hops, boil in two quarts of water. Strain it upon some wheat flour sufficient to make a thick batter so that it will rise.

When light knead in corn meal enough to make it stiff as dough; let it rise, then mould it twice. Then break it up fine and let it dry, rubbing it daily as it grows dry, till it is nearly as fine as corn meal. Keep in a dry place, and where it will not freeze. Do not put in any salt.

Scrap-Book.

"A little humor, now and then,
Is relished by the best of men."

THE BARGAIN FOR A WIFE.

A YOUNG Norfolk farmer, on beginning life with a limited capital, found that two things were wanted to do justice to a large farm which he rented on a long lease; namely, a wife to rule the house at home, and an additional thousand pounds to invest upon the land. Like a sagacious man, he conceived that the two might be found combined, and he began to look about for a cheerful lass with a dowry to the desired amount. Accident threw him one day into company with the parson of a neighboring parish, with whom, as he rode home, while returning from market, they fell into conversation. Encouraged by the divine, the youth unburdened himself of his cares and plans, and mentioned the desire he had for marrying as soon as he could find an agreeable lass with a moderate dowry.

"I tell you what," said the parson, "I've got three daughters, and very nice girls they are, I assure you. Suppose you come and dine with me next market day—you will meet them at the table; and if any of them should prove to be the "inevitable she" that you are in search of, I shall not be backward to do my part as far as I can."

"Agreed," said the youth. "I'll come, as sure as you're alive, if you'll say nothing about it to the ladies."

"That shall be a bargain. On Saturday next then, we shall have you at dinner, at five." And here their roads diverging, the two gentlemen separated.

At the appointed hour on the following Saturday, the young farmer, in handsome trim, descended from his galloway at the parson's door. Dinner was served in a few minutes after, and the young ladies, with their mother, graced the table with their presence. All three fully justified the ecomiums of their father; but the youngest—a rosy faced, roguish, cheerful lass, just escaped from her teens—alone made a vivid impression upon the young farmer. The repast progressed agreeably, and when ended, the ladies withdrew, leaving the gentlemen to chat over their wine.

"Well," said the host, "what do you think of my girls?"

"I think them all charming," said the youth; "but the youngest—you call her Nelly—really is most bewitching, and clever too; and if I am to have the honor of being allied to you, you must give me her."

"That is against all rule," returned the host; "to take the youngest first; but, of course, I cannot control your choice. What dowry do you expect?"

"My capital," said the wooer, "is three

thousand pounds, and I want a thousand more—and I must have it."

"I will give you a thousand with the eldest girl."

"No; the charming Nelly and the thousand, or I am off."

"That cannot be; five hundred with Nelly if you like. The others are not half so handsome and must have a fortune, or I shall never get them off."

"No; my resolution is fixed, replied the young gentleman; and I shall never alter my mind."

"Nor I mine," said the parson, "and the affair is at an end; but we will be good friends, notwithstanding."

The conversation, which each speaker supposed to be strictly private, now fell into another channel. The ladies returned with the tea-urn, and chatted unreservedly with the farmer. Evening came on, and towards sunset, the girls having strolled into the garden, the youth rose to take his leave. He found his nag in the stable, and having bid farewell to his host, took his way through the shrubbery that led to the road. He was about alighting to open the gate, when the rosy-faced Nelly darted forward to save him the trouble. As she lifted the latch, she archly looked up in his face and said—

"Can't you take my father's money?"

"Yes, by Jove, I will, if you wish it."

"Then come over to the church to-morrow morning, and tell him so after service," and she vanished like an elfin sprite among the shrubbery.

Musing on the proverb which says, "walls have ears," the young farmer rode home. He did not fail—how could he?—of attending at the church the next morning, and after the sermon, declared to the parson his altered resolution. He married the fair Nelly three months afterwards; and she brought him in due course of years a row of goodly sons, than whom there are few at the present hour wiser in their generation, or more worthy, or more wealthy, in the whole of broad England.—*Chambers' Journal*.

MASON AND DIXON'S LINE.

ONE calling himself a "Boy subscriber to the American Agriculturist," wishes us to tell him what is meant by Mason and Dixon's Line, as he can find nothing about it in his geography.

It usually means the boundary between the free and slave States. It formerly only referred to a boundary line between Pennsylvania and Delaware. There was for a long time a dispute about some lands claimed by these States. A few years before the Revolutionary War, the king of England appointed two surveyors, or commissioners, to settle the dividing line. Their names were Mason and Dixon, and the line agreed upon by them was called "Mason and Dixon's line." This term has now come to be applied, as above stated, to the entire division line between the States holding slaves and those not holding them.

THAT IS A BOY I CAN TRUST.

I ONCE visited a large public school. At recess a little fellow came up and spoke to the master; and as he turned to go down the platform the master said, "That is a boy I can trust—he never failed me." I followed him with my eye, and looked at him when he took his seat after recess. He had an open, manly face. I thought a good deal about the master's remark. What a character had that little boy earned! He had already got what would be worth more to him than a fortune. It would be a passport into the best store in the city and what is better, into the confidence and respect of the whole community.

I wonder if the boys know how soon they are rated with older people. Every body in the neighborhood is known, and opinions are formed of each individual. All have characters, either favorable or unfavorable. That boy, of whom the master can say, "I can trust him—he never failed me," will never want employment. The fidelity, promptness, and industry, which he shows in school, are in demand everywhere, and are prized every where. He who is faithful in little will be faithful also in much. Be sure, boys, that you earn a good reputation at school. Remember you are just where God has placed you, and your duties are not so much given you by your teachers, or your parents, as by God himself.—*Maine Temp. Journal*.

BROWN BREAD TOAST.

THE following passage concludes the poem recently delivered by Curtis, at the commencement of Brown University.

The Muse begins to feel she is a bore,
And yet one line she craves, but one word more.
He is the test whose virtues she has told,
The man whose memory will not grow old.
'Twas ever held since first the world began,
'Tis of great need to be a well-bred man;
The word includes—if you will not refuse,
A generous charity—just what you choose.
But how to be well-bred—what shall you do,
To have it known a well-bred man means you!
Much observation only can decide,—
Go search the world and seek on every side,
I, for my part, have but my word to say.
I, uncollegiate, till this very day,
Could never call my Alma Mater brown;
Yet a brown toast will give you, sitting down,
And wish to state it gently, without noise,
I find the best bred men were BROWN-BREAD BOYS.

"GRANDFATHER," said a saucy little representative of "Young America" the other day, "how old are you?" The old gentleman, who had been a soldier, and was much under the ordinary size, took the child between his knees, and said: "My dear boy, I am ninety-five years old; but why do you ask?" The little fellow, with the importance of a Napoleon, replied, "Well, it appears to me that you are remarkably small of your age."

IGNORANCE is an expensive luxury. The want of a little gumption costs many a life of comfort, convenience and similar fine things. Mr. Short don't know but every body is as honest as other folks, and so gets taken in every time he goes out. Miss Simple, too, has a universal confidence in every thing and body, and pays for the privilege by being a universal victim.

THERE are, at the present time, in this country, not less than fifty persons incarcerated on the charge and under sentence of death for murder, caused by that body-and-soul destroyer, Rum. Is not this an awful subject for reflection? Rum! War has been a pigmy destroyer compared with it.

"BOB, who was the first man?" asked one juvenile of another, the other day. "Why, Adam, to be sure," was the answer. "Well, who was the first woman, then?" "Why, Adam's mother, of course."

"MITH THIMMOTH," said a lisping little fellow of five, "I'm alwath real glad when you come a vihting to our houth." "Are you, my little dear—you are fond of me, then?" "No, that ain't it, Mith Thimmoth; but 'cauth then we alwath have two kindh of pieth."

THERE is in this life no blessing like affection—it soothes, it hallows, alleviates, subdues.

A FELLOW who had been hooked by an unruly cow limped in his gait. A woman remarked that he appeared to be intoxicated. "Yes," replied her beau, "he has been taking a couple of 'horns.'"

A GENTLEMAN meeting one of his friends who was insolvent, expressed great concern for his embarrassment. "You are mistaken, my dear sir," was the reply; "it is not I, 'tis my creditors who are embarrassed." Appropriate to the times.

"Is that the second bell?" inquired a gentleman of a sable porter at a country boarding-house, the other day. "No sar!" exclaimed the darkey, "dat am the secon' ringin' of de fust bell—we has but one bell in dis house."

HARD ON THE WOMEN.—The inability of a wife to make bread has been declared sufficient ground for a divorce, by the Jones County Agricultural Society of Iowa.

VEILS INJURIOUS.—A celebrated writer on the sight, says that wearing veils permanently weakens many naturally good eyes, on account of the endeavors of the eye to adjust itself to the ceaseless vibration of that too common article of dress.

"I'm going to the post-office, Bob, shall I inquire for you?"

"Well, yes, if you have a mind to, but I don't think you will find me there."

"WHY does father call mother, honey?" asked a boy of his elder brother.

"Can't think, 'cept it's cause she wears a large comb in her head."

A COUNTRY individual who was caught in the water-wheel of a saw-mill, says he intends to apply for a pension, as he is a survivor of the Revolution.

"I go through my work," as the needle said to the idle boy. "But not till your hard pushed," as the idle boy said to the needle.

"SAL," said lisping Bill, "if you don't love me, thay tho; and if you do love me and don't like to thay tho, squeeth my handth."

"COME here, my dear, I want to ask you all about your sister. Now, tell me truly, has she got a beau?" "No, it's the mumps she's got," the doctor says so.

A LITTLE girl meeting a countryman with a load of slaughtered swine, dropped a courtesy. The rustic laughed, without returning the civility. "What," said he, "do you courtesy to dead hogs?" "No, sir," replied the little miss, "I courtesied to the live one!" The hog-man sloped with a pig's foot in his chops.

WHAT men want is not talent, it is purpose; in other words, not the power to achieve, but the will to labor.

POLITICS is the art of being wise for others; policy, the art of being wise for one's self.

If a pair of glasses are spectacles, is one a spectacle? And if so, is it not a bad show for a sight?

THE Yankee who was "lying at the point of death," whittled it off with his jack-knife, and is now recovering.

VARIETIES.—When is iron the most ironical? When it's a railing.

BEAUTIFUL EXTRACT.—Helping a young lady out of a mud puddle.

GREECE NEWLY DEFINED.—Since Greece has been backing up Russia, it has been called the "Russian Bear's Greece."—*Punch*.

A CURIOSITY.—The man who is not "as much in favor of temperance as any body."

A MAN had better be poisoned in his blood than in his principles.

Markets.

REMARKS.—As we anticipated, Flour has again given way, and the fall has been very heavy the past week, say from \$1 25 to \$1 50 per bbl.; making the decline of the past fortnight, from \$2 to \$2 12½. This is the greatest fall in Flour within so short a time, that we now recollect ever before witnessing in this market. Wheat and Rye have had a corresponding tumble,

while Oats and Corn have each fallen only about 3 cents per bushel. Potatoes have also given away some. Pork and Beef are 50 to 62½ cts. per bbl. lower. Clover seed 1 to 1½ cts. per lb. less, while Timothy has improved a trifle. Wool, we regret to state has, fallen some the past week, but so much has been sold at this decline it is hoped now it will go no lower.

Cotton has advanced one-eighth of a cent per lb. since our last. About the same in Rice, and all Southern products are in active demand.

The Weather has been warm for the season with one good night's rain. All fall crops are growing finely.

PRODUCE MARKET.

Saturday, Sept. 30, 1854.

THE prices given in our reports from week to week, are the average wholesale prices obtained by producers, and not those at which produce is sold from the market. The variations in prices refer chiefly to the quality of the articles.

The weather this morning is clear and cool, and the market brisk. There is but little change in produce generally. Potatoes remain about the same—a little on the decline if any thing. Tomatoes are very high, selling at \$1 50 to \$1 75 per basket. Cabbage has fallen to \$4 to \$6 per hundred. Cranberries are also lower, and quite plenty. The butter market, too, is rather dull. Butter sells from 2s. to 3s. 3 lb.; and eggs from 1s. to 2s. 3 doz., less than last week.

VEGETABLES.—Potatoes, Mercers, \$3 to \$3 25 per bbl.; white, \$2 75 to \$3; Sweet, Philadelphia, \$3 50; Virginia, \$3 25; Beets, \$3 to \$3 50 per hundred bunches; Carrots, \$3 to \$3 25; Parsnips, \$3 50; Tomatoes, \$1 50 to \$1 75 per hundred bunches; Marrow Squashes, \$1 75 to \$2 per bbl.; Cabbage \$4 to \$6 per hundred; Pumpkins, \$4 to \$6 50 per hundred; Citron Melons, \$75c to \$1 per doz.

FRUITS.—Apples, \$2 50 per bbl.; Pears, cooking, \$4; eating, \$8 to \$10 per bbl.; Peaches, nearly out of season; Grapes, 4c to 10c per lb.; Cranberries, \$6 to \$7 per bbl. Butter, 20c to 22c per lb.; Eggs, 18c to 19c per doz.; Cheese, 10c to 11c per lb.

NEW-YORK CATTLE MARKET.

Monday, Oct. 2, 1854.

OWING to the issue of our paper this week one day earlier, so as to have our City Guide reach subscribers coming to the Show, we are unable to give full particulars of the cattle market. When we came away from Washington Market this forenoon, the appearance was that the prices would average about the same as last week. The supply of cattle, however, is larger—probably 2,500 or 2,600 against 2,292 of the previous week. There is no doubt that all will be needed to supply the demand, which is always greater at this season of the year—especially on so fair a day as this, which makes as great a difference in the sales of animals, as in their appearance. Still, the cattle to-day are inferior in quality to those of last week—though in the main better than the average for a month past. A superior drove came in from Chester Co., Pa., owned by Joseph Williams. This gentleman, of whom we made mention last week, deserves credit for the excellent stock with which he honors the markets. Superior quality beef is selling to-day from 9c. to 10½c. Inferior from 7½c. to 9c.

The sheep market as given in our last report, continues dull, though is evidently improving.

Another week of cool weather will no doubt make it much better.

Beef is selling at Chamberlin's, Robinson street, from 8c. to 10½c. per lb.

Cows and calves,	\$20 to \$50
Sheep,	\$2 50 to \$6
Lambs,	\$1 75 to \$4
Veals,	5c. to 8c.

ATTENTION, FARMERS!—ONE OF THE BEST WORKS on Practical and Scientific farming yet issued, is

NORTON'S ELEMENTS OF SCIENTIFIC AGRICULTURE.

It is simple, plain, and practical in its teachings, and while leading the reader to a knowledge of the scientific principles applicable to common farming operations, it does not confuse by a needless use of technical terms.

This work received the highest premium and the strong commendation of the New-York State Agricultural Society. Price 60 cents, sent by mail free of postage.

Published by CLARK, AUSTIN, & SMITH, 3 Park Row, New-York.

P. C. (not P. T.) BARNUM & CO., PROPRIETORS,
WILL BE OPEN,
FREE OF CHARGE,

to an admiring public, during all the FAIR WEEK, (as well as at all other times.)

This is one of the most COMPLETE and EXTENSIVE CLOTHING ESTABLISHMENTS on the WESTERN CONTINENT.

Every article fitted to clothe and ornament the "human form divine," from a huge surtout to an infant's jacket, is here found in great variety, and at all prices, from the lowest known upwards.

Let it be DISTINCTLY UNDERSTOOD that every article SOLD at this establishment is of the VERY BEST QUALITY AND MAKE, and in the MOST FASHIONABLE STYLE.

The spacious Halls and numberless salesman's counters now occupy a surface of

30,000 SQUARE FEET,
and in a few weeks this space will be DOUBLED.

Every person coming to NEW-YORK is invited to call and SEE for themselves.

Look in, and BUY ONLY when satisfied, that it is for your INTEREST to do so. No over-urging or false representations will be allowed, it being the determination of the Proprietors to continue to stand before the public—as they have stood for 17 years past—as HONEST, UPRIGHT dealers.

PERFECT AND DURABLE GOODS.
SMALL PROFITS AND LARGE SALES
IS THEIR UNDEVIATING MOTTO,
by adhering to which they have reached on eminence hitherto unattained by any other similar establishment.

The SALES ROOMS are located on the WEST side of
CHATHAM SQUARE.

HELVETIA AND LAFAYETTE GOLD MINING COMPANY, located at Grass Valley, California—organized July 7, 1852—is now in the full tide of successful operation; its veins are opened, being worked and highly productive; its mill is of great power, complete in all respects, and now working with the most satisfactory results, and its prospects for future success, founded upon actual experience, are of an unusually flattering nature. There was taken out previous to Dec. 20, 1852, upwards of \$169,000, and the yield of the mine is steadily increasing with each successive report.

It is by far the most successful mining company in California, and its Directors confidently anticipate quarterly dividends of not less than 10 per cent, commencing in October next. Dividends payable quarterly in October, January, April and July, at the Office of the Company in Grass Valley, and at the agency office in New-York.

A few shares, and copies of the charter and by-laws, together with other particulars, may be obtained upon application to 2-15 DANIEL ADELL, Agent, 107 Fulton-street, N. Y.

WHEELER AND WILSON MANUFACTURING COMPANY'S IMPROVED SEWING MACHINES, manufactured at Watertown, Conn. Office and Warerooms, at 343 Broadway, N. Y.

These Machines have been in successful operation, in the hands of manufacturers and families, for the past two years, and in every case have given universal satisfaction. The Proprietors are now prepared to offer them to the public, with that increased confidence in their merits which the united testimony of their numerous customers has strengthened and confirmed.

These Machines are entirely different from any other, the principles on which they are made being exclusively our own.

Among the advantages of this Machine over any others are the following:

1. The simplicity of its construction, and the ease with which it can be kept in the most perfect order.
2. The perfect manner with which the operator is enabled to stitch and sew the various kinds of work, from the finest linen to the coarsest cloth.
3. It particularly equals in the rapidity with which work can be executed; in that respect it has no equal.

The little power required to propel them, enabling even those of the most delicate constitution to use them without injury to their health.

We are now manufacturing a larger sized Machine, more particularly adapted to the sewing of leather, canvass bags, and the heavier kinds of cloth.

An examination of our Machines is respectfully solicited at our Office, 343 Broadway. 37-55

A NEW FERTILIZER.

THE LODI MANUFACTURING COMPANY, (who have been manufacturing Poudrette for the last 14 years,) have, by a recently-discovered process, been enabled so completely to disinfect Night Soil, as to present to the Agricultural World, that long sought after and greatly to be desired article.

PURE NIGHT SOIL, DISINFECTED AND DRIED.

This article differs from Poudrette, and every other article of manure made from human excrement, from the fact that it contains no mixture of foreign substance whatever, (except 5 per cent. of calcined gypsum, which is used to retain any fugitive ammonia,) the sulphuretted hydrogen which is the offensive gas escaping from Night Soil, is taken from it by a peculiar process. It is, also, entirely separated from rubbish not smaller than a pin's head, and so concentrated, that its bulk is decreased one-half by manufacture, yet, at the same time, none of its virtues are allowed to escape. The Lodi Manufacturing Company have selected the Chinese words designating desiccated night soil as the name for this article, viz. —

TA-FEU.

and offer it for sale under the following guarantees:

1st.—That it is free from unpleasant odor, and contains 95 per cent. of night soil concentrated, and 5 per cent. of calcined gypsum, and nothing else.

2d.—That it cannot be surpassed by any other manure in the world, either in fertilizing power or in cheapness.

3d.—That it is equal to Guano, in the proportion of 4 pounds of Ta-fen to 3 pounds of Guano. That it is equal to any superphosphate of lime now in market pound for pound on any crop, and is one-third cheaper than Guano, and twice as cheap as superphosphate.

4th.—It contains every kind of good necessary to the growth of plants, and is perfectly soluble in water, making, therefore, a splendid top-dressing on grass and grain.

It is perfectly dry, and can be bagged or barreled, and sent to any part of the United States. Price \$30 per ton of 2,240 lbs. for any quantity over 10 tons; under that, \$25. No charge will be made for cartage or package.

Persons wishing to try it, can send us any amount, from \$3 upwards, and the exact number of pounds will be forwarded, with directions for use.

We recommend it strongly on cabbage plants, turnips, wheat, grain and grass, either sowed or harrowed in, or as a top-dressing, after the grain is up. On cabbages and turnips it has already been tried with astonishing results, having doubled the size of cabbage plants in a week.

From 300 to 500 lbs. per acre will be a first-rate dressing for grass in the fall, and for grain followed by grass; a table-spoonful is more than sufficient for a cabbage plant.

All communications must be addressed to the LODI MANUFACTURING COMPANY, 74 Cortlandt St. New-York. 49-54

FOR SALE AT THE SOUTH NORWALK NUBSFRY A fine stock of the NEW-ROCHELLE (OR LAWTON) BLACKBERRY PLANTS, at six Dollars per dozen; also the White Fruited Variety at 3 dollars per dozen; also the new pure Red Antwerp Raspberry. GEO. SEYMOUR & CO., South Newark, Conn. 51-76

LAWTON BLACKBERRY PLANTS.

FOR SALE THIRTY OFFSHOOTS WITH PLENTY OF roots, to be taken from plants which are in full bearing, with the true variety of Mammoth fruit, in packages of not less than half a dozen, or by the hundred. Apply at the office of WM. LAWTON, 54 Wall-st, New-York. 52

NEW-ROCHELLE BLACKBERRIES.—MY STOCK OF plants for the coming spring is already sold out. For the satisfaction of those who wish to know the price at which I sell them, I state that it is twenty-five dollars per hundred, and not twenty-five nor fifteen cents, as it has been incorrectly printed in the newspapers. ISAAC ROOSEVELT, Pelham, Westchester Co., N. Y. 52-55

SUPERIOR SEED WHEAT.—A LARGE ASSORTMENT of the best varieties of improved seed wheat; among which are the Red Mediterranean, White Mediterranean, Soule's and Blue stem, Seed Rye of the best winter variety. For sale by R. L. ALLEN, 189 & 191 Water-st. 52-5f

Cotswold Rams, and 3 Buck Lambs. Apply to JOHN F. CLEW, Hyde Park N. Y.; Or, 90 Maiden Lane. 50-53

THE HORSE, THE HORSE, NOBLEST OF DOMESTIC ANIMALS.

AND THE ONE MOST FREQUENTLY ILL-TREATED, neglected, and abused. We have just published a book so valuable to every man who owns a Horse, that no one should willingly be without it. It is entitled,

THE MODERN HORSE DOCTOR.

and is from the pen of that celebrated English Veterinary Surgeon, Dr. GEO. H. DADD, well known for many years in this Country, as one of the most successful scientific and popular writers and lecturers in this branch of medical and surgical science. The book which he now offers to the public is the result of many years' study and practiced experience which few have had.

From the numerous and strong commendations, of distinguished men and the newspaper press, we select the following: Extracts from a letter from Hon. John H. Clifford, Ex-Governor of Mass.

New-Bedford, May 11, 1854.

Dr. Dadd,—Dear Sir,—I hope your new work on the noble creature that man has ever been permitted to hold in subjection (the Horse) will meet with that success, which all your efforts in this direction so well deserve.

Your obedient servant, JOHN H. CLIFFORD.

From Hon. Marshall P. Wilder, Boston, May 13, 1854.

Dr. Dadd,—My Dear Sir,—I am greatly obliged to you for the valuable treatise, the results of your own investigations, which you have recently issued, hoping that it may meet with the patronage of a discriminating community. I remain yours with great regard, M. REHALL P. WILDER.

The "Modern Horse Doctor," by Dr. G. H. Dadd, is a manual of genuine science, and ought to be owned and studied on the score of humanity, as well as interest, by every man who owns a horse.—Boston Congregationalist.

Dr. Dadd has had great experience in the cure of sick horses, and explains the secret of his success in this vol.—N. Y. Tribune.

The author of this work is well known as a most skilful veterinary surgeon. His book is based on the soundest common sense, and as a hand-book for practical use, we know of nothing to compare with it.—Yankee Blade.

We know Dr. Dadd well, and are satisfied that he possesses most important qualifications for preparing such a book as this.—New-England Farmer.

Messrs. Jewett & Co. have just published a very valuable work by Mr. Dadd, a well-known veterinary surgeon, on the causes, nature and treatment of disease, and lameness in horses.—Farmer's Cabinet.

This is one of the most valuable treatises on the subject, ever published; and no owner of that noblest of the animal race, the horse, should be without it. Especially should it be in the hands of every hotel and livery-stable keeper. To many a man would it be worth hundreds of dollars every year.—Ind. Democrat, Concord.

By far the most learned and copious work on the horse and his diseases, we have ever seen.—N. Y. Evangelist.

One of the greatest and most commendable qualities of this work, is, it is practical and plain to the comprehension of those farmers and others for whom it is mainly designed. The course of treatment favors generally a more sanitary and rational system of medication than that recommended in any previously existing works on farriery. No farmer or owner of a horse should be without this book. Stable keepers, stage proprietors and hackmen we believe would derive profit by having at least one copy hung up in their stables for use and reference by their stable men.—Daily News, Philadelphia.

There is more common sense in this book than any of the kind we have ever seen, and farmers and owners of horses would find it a matter of economy to possess themselves of it. It will be of more service than the counsel of a score of ordinary doctors.—Albany Courier.

We deem this decidedly the best and most reliable work on the "Cause, Nature, and Treatment of Disease and Lameness in Horses," ever published.—Nantucket Inquirer.

What we have read of this book induces us to regard it as a very sensible and valuable work; and we learn that those much more competent to judge of its value, have given it their unqualified approval.—Ev. Traveler, Boston.

This book supplies a great desideratum which Skinner's admirable treatise on the Horse did not fill. Every man who has his own veterinary surgeon, or who wishes with much greater safety to his noble animal, than by trusting him to the treatment of the empirical itinerants who infest the country. It is well illustrated, and should be purchased by every man who owns a horse.—Ev. Mirror, N. Y.

This is a book that should be forthwith put into the hands of all who own or drive horses, whether for the dray or gig, for the plow, omnibus or road, for hard service or pleasure.—McMakin's Courier, Philadelphia.

A good, clearly-written book, which should be in the hands of every man who has a horse whose ills his affection or his purse make it worth while to cure.—Bangor Mercury.

It is a valuable book to those who have the care of horses.—Hartford Herald.

This is a scientific, thorough and complete treatise upon the diseases to which one of the noblest of animals is subject, and the remedies which they severally require.—Troy Daily Budget.

It is not worthy to have a horse in his care, who will not use such a work to qualify himself for his duties to this animal.—Commonwealth, Boston.

Published by JOHN P. JEWETT & CO., Boston, JEWETT, PROCTOR & WORTHINGTON, Cleveland, Ohio. For sale by all Booksellers. 60-63.

DEVON CALVES.

THREE DEVON BULL CALVES—PEDIGREES WILL BE given—for sale, by Edward G. Faile, West Farms, Westchester County, N. Y. 50-53

SHORT-HORN CATTLE AND SHEEP FOR SALE.

THE FOLLOWING SHORT-HORN AND OTHER STOCK. (All pure bred animals) were sent out by Mr. Rotch, of Otsego Co., N. Y., to his farm, situate one mile from the county-seat of Edwards Co., Illinois, and are now there, as the farm is to be disposed of. For further particulars address Col. Hudson on the premises.

Cuba.—A red and white bull, calved April 17, 1853; got by Prophet, dam Coral, by Burtam 2d, (3144) gd Conquest, by Washington, (1566) ggd Pansey, by Blaize, (76) ggd Primrose, by Charles, (127) ggd, by Blyth Comet, (75) ggd, by Prince, (521) ggd, by Patriot, (486).

Prophet is a grandson of Yorkshiraman, (5700), who was bred by Mr. Thomas Bates; his dam Phoenix, entered in herd book, Vol. V., page 799, as produce from Prince's, &c.

Tea Rose.—A roan cow, calved May 2, 1848, got by Westchester, dam White Rose, by Spots, (5207) gd Yellow Rose, by Young Denton, (963) ggd Arabella, by North Star, (460) ggd Aurora, by Comet, (455) ggd, by Henry, (301) ggd, by Danby, (190).

Westchester was by Yorkshiraman, (5700), by thus making Tea Rose a descendant on the bull's side, from the Kirkleavington herd.

Prairie Rose.—A red heifer calf from Tea Rose, by Prophet. See pedigree of Tea Rose.

Pheasant.—A red heifer calved in the spring of 1852, by Prophet, dam Phlox, by Yorkshiraman, (5700) gd Phoenix, by Hero, (4020) ggd Princess, by Washington, (1566) ggd Pansey, by Blaize, (76) ggd Primrose, by Charles, (127) ggd, by Blyth Comet, (75) ggd, by Prince, (521) ggd, by Patriot, (486).

The numbers refer to the English Herd-book, where the full pedigree of each animal may be found. Besides the above, there are a few South-downs, and a few French merino sheep and lambs, all purely bred, Dorking fowls, &c. 50-51

FOURTEENTH ANNUAL CATTLE SHOW AND EXHIBITION

OF THE NEW-YORK STATE AGRICULTURAL SOCIETY, HELD IN CONNECTION WITH THE AMERICAN INSTITUTE AND NEW-YORK HORTICULTURAL SOCIETY, AT HAMILTON SQUARE, IN THE CITY OF NEW-YORK, OCTOBER 3d, 4th, 5th, and 6th, 1854.

THE ANNUAL EXHIBITION OF THE SOCIETY WILL be held as above in the City of New-York, from Oct. 3d, to 6th, on which occasion upwards of *Eight Thousand Dollars* are offered as premiums to be contended for with Cattle, Horses, Sheep, Swine, Poultry, Dairy Products, Farm Implements and Machinery, domestic and other Manufactures, Flowers, Fruits and articles in all the mechanical departments, the full particulars of which will be found in the List of premiums published. A large portion of the Premiums are open to competition by persons out of the State.

It is believed that this combined Exhibition will be the most extensive ever held in this country, and will afford to exhibitors, the advantages never before offered in every department of the Exhibition, combining the entire industrial interest of the farmers, manufacturers, mechanics, horticulturists and artisans of our country.

Persons desirous of examining the list of Premiums and Regulations, or of entering stock, implements, or other articles for exhibition will please apply to B. P. Johnson, Secretary, State Agricultural Rooms, Albany, at the Rooms of the American Institute, 351 Broadway, New-York, where the Premium List and Regulations will be furnished, and every desired information in relation to the exhibition given.

Stalls and fodder, for stock, and erections for the other articles will be provided in season so that all articles designed for Exhibition can be taken to the show grounds on their arrival in the City where they will be provided for and protected. The following Railroads have agreed to transport all stock and articles on exhibition free, requiring the freight to be advanced on delivery and repaid on return of the articles with evidence of being exhibited &c.: Hudson River, New-York and Erie, New-York City and Buffalo, Ithaca and Owego, Canandaigua and Elmira, New-York Central, Rome and Watertown, New-York and Harlem, Long Island, Troy and Boston, and it is presumed all the Railroads leading into New-York will afford the like facilities.

Application to transport articles, should be made in season to the nearest Station Agent.

B. P. JOHNSON, Sec. WM. KELLY, Pres. Aug., 1854. 49-53

AGRICULTURAL IMPLEMENTS.

AGRICULTURAL IMPLEMENTS.—THE SUBSCRIBER keeps constantly on hand, and offers for sale the following valuable implements:

Fan Mills of various kinds, for rice as well as wheat, rye, &c. Grain Drills, a machine which every large grain planter should possess. They are of the best patterns, embracing most valuable improvements.

Smut Machines, Pilkington's, the most approved for general use.

Hay and Cotton Presses—Bullock's progressive power-presses, combining improvements which make them by far the best in use.

Grain mills, corn and cob crushers, a very large assortment of the best and latest improved kinds.

Horse Powers of all kinds, guaranteed the best in the United States. These embrace—1st. The Chain Power, of my own manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, and economy. They are universally approved wherever they have been tried. 2d. The Bogardus power, for one to four horses. These are compact, and wholly of iron, and adapted to all kinds of work. 3d. Eddy's Circular Wrought Iron Power, large cog-wheels, one to six horses, a new and favorite power. 4th. Trimble's Iron-Sweep Power, for one to four horses. 5th. Warren's Iron-Sweep Power, for one to two horses.

GRAIN MILLS, STEEL AND CAST IRON MILLS, AT \$6 to \$25, and Burr-Stone at \$50 to \$250, for Horse or Steam Power.

TILE MACHINES.—FOR MAKING DRAINING TILES OF all descriptions and sizes.

WATER RAMS, SUCTION, FORCE, AND ENDLESS- chain Pumps; Leather, Gutta Percha, India Rubber Hose, Lead Pipe, &c.

CALIFORNIA IMPLEMENTS OF ALL KINDS, MADE EX- pressly for the California and Oregon Markets.

DRAINING TILES OF ALL FORMS AND SIZES.

CLOVER AND TIMOTHY SEED HARVESTER.—A newly- patented machine, will harvest 10 or 12 acres per day with one horse.

WILLARD FELT, NO. 191 PEARL STREET, (NEAR

Malden Lane) Manufacturer of Blank Books, and Importer and Dealer in Paper and Stationery of every description. Particular attention paid to orders. 26-77

STOCK.

IMPROVED STOCK OF ALL KINDS.—HAVING HAD great experience in breeding and rearing fine stock for the past twenty years, I offer my services to my friends to procure it of the best and most reliable kinds. As much notice as convenient is at all times desirable previous to purchasing, as it takes time to make good selections. Early in August or September is the best time to purchase for the South.

Short Horn or Durham cattle, Devons, Herefords, Alderney or Jersey and Ayrshires. Long-wooled Sheep—the Cotswold, Oxford, Leicester, Bakewell, and Lincoln. Mutton Sheep—the Southdown. Fine-wooled Sheep—such as the Saxon, Spanish, and French Merino.

The public should be on their guard in purchasing improved stock, as many animals are palmed off upon the unsuspecting and ignorant, who are so duped.

A. B. ALLEN, Nos. 189 and 191 Water.

Special Notices to Subscribers, Correspondents, &c.

Subscriptions can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September as a half yearly volume of 416 pages, with a complete index—begins on each of those dates.

Those wishing their papers changed from one office to another, should give the name, county, and State, of their old and new Post-office.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by Mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Clubs may add to their number at the same rate per copy as was paid by the original members.

The paper is stopped when the time for which it is paid expires. A notice or bill is usually sent in the last number.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then enclose them in the presence of the Post-master. Give the Post office, and the County and State. Write these very plainly.

Economical Arrangement to furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished with Harper's Magazine, one year for	\$4 00
" Putnam's do do	4 00

PUBLISHERS' ANNOUNCEMENT!

Thirteenth Volume of THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

THE AMERICAN AGRICULTURIST,

A weekly Periodical of 16 large quarto pages; making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

N. B. The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume for the bound work.

COMPREHENSIVE IN ITS CHARACTER,

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the actual transactions which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers constantly and reliably advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "farmer's column," so popularly known in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent farmers of this country in their continued effort to furnish a weekly paper of high and reliable character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers only that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon its own merits; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is untrammelled by any collateral business connections whatever; nor is it the organ of any clique, or the puffing machine of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the editorial supervision of Mr. A. B. ALLEN,—its principal editor for the first ten years—and Mr. ORANGE JUDN, A.M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical agriculture, and, in addition to these, a number of other eminent agricultural and horticultural writers.

All the editors are men practically experienced in their profession, each of whom can handle the Plow as well as the Pen.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers,	-	-	-	\$2.00 a year, \$2.00
" Clubs of 3 do.	-	-	-	1.67 " 5.00
" do. 5 do.	-	-	-	1.60 " 8.00
" do. 10 do.	-	-	-	1.50 " 15.00
" do. 20 do.	-	-	-	1.25 " 25.00

The money always to accompany the names for which the paper is ordered.

The Post-Master, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Post-Master, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, Weekly Tribune, or Weekly Times, or any other paper or periodical in this city, not costing to exceed two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if enclosed and mailed in the presence of the Post-Master.

Communications for the paper should be addressed to the Editors; subscriptions, advertisements, and all matters relating to the business department, should be addressed to the Publishers,

ALLEN & CO.,

AMERICAN AGRICULTURIST.

Designed to improve the Farmer, the Planter, and the Gardener.

AGRICULTURE IS THE MOST HEALTHY, THE MOST USEFUL, AND THE MOST NOBLE EMPLOYMENT OF MAN.—WASHINGTON.

PUBLISHED WEEKLY BY ALLEN & CO., 189 WATER ST.

VOL. XIII.—NO. 4.]

NEW-YORK, WEDNESDAY, OCTOBER 11, 1854.

[NEW SERIES.—NO. 57.

FOR PROSPECTUS, TERMS, &c.,
SEE LAST PAGE.

FOURTEENTH ANNUAL EXHIBITION OF THE NEW-YORK STATE AGRICULTURAL SOCIETY.

THIS was held at Hamilton-square, in the City of New-York, on the 3d, 4th, 5th and 6th of October. The American Institute united with the State Society in its Agricultural department, and the New-York Horticultural Society in that of horticulture; combining thus three exhibitions in one, making it in some respects the best that has ever been held in the State.

The grounds were spacious, and the arrangement a model, such as we hope the Society will mainly copy in all its future exhibitions. For the plan, and carrying it into effect, with all the attending details, the Society is indebted to the Building Committee, Messrs. FAILE, BELL and MORRIS. To understand the plan, it is necessary to inspect the handsome lithograph of it, which will undoubtedly be found in the forthcoming volume of the Transactions of the Society. We earnestly invite the officers of all other Societies in the United States to give it a careful inspection. We speak of the general arrangement only, and not of the exact number of feet and inches that the stalls, pens, show and exercising rings, and halls and tents occupied.

The horse stalls, and sheep and pig pens, projected on three sides from the high board fence which surrounded the Show Grounds; the horse stalls having doors with padlocks on them, for the safety of the animals at night. About one-third of the grounds were devoted to the cattle stalls, which were erected with tight boarded roofs, and placed in parallel lines, so wide apart that crowds could pass easily between them without being incommoded, and take a leisurely inspection of the animals both before and behind.

Contiguous to the horse stalls was an oblong riding and driving ring, 180 by 300 feet, and two leading rings, each 110 by 180 feet, for the display of the horses. There were also rings of a suitable size for the examination of the cattle by the judges. The halls for the mechanics, agricultural implements, vegetables, fruits, flowers, seeds, &c., were ample and commodious.

HORSES.

The show in horses was large, and highly meritorious in the classes exhibited. The entries were 205; consisting almost exclusively of blood and trotting stock, and single or matched roadsters. We doubt if any

show has exhibited better or more numerous specimens in these classes. We noticed those superb imported horses Trustee and Monarch, which have already won such deserved distinction among American breeders. Monarch we recognized as an almost faultless specimen of the thoroughbred, that we saw in the stables of his former owner and importer, Col. Wade Hampton, of South Carolina, some eight years ago. He has the appearance and sprightliness of a colt, though some 20 years old. He now belongs to Col. Morris, of Fordham, the present owner of Fashion and her colt, both of which were in fine condition, and on the show grounds.

We were sorry to notice an almost entire absence of the cart-horse—the horse of all work—brood mares and colts. But the truth is, that few horses are reared within 100 miles of this city; and though a larger number of these animals are used within these limits than on any other equal space in the United States, there is not the interest in exhibiting there would be if bred in this vicinity.

ADAMS's Express exhibited three large and very fine bay horses, harnessed tandem, before a huge wagon. With heavy bearskins over their colars, and stout, heavy, silver-plated harness, they made as brave a show as a company of grenadiers.

MULES.

But whatever deficiency there may have been in work horses, it was more than compensated for in the mules. We much doubt if such a selection of mules was ever before brought together. Nearly 50 were on the ground, mostly in well-matched pairs, and every one far above the ordinary style of mule in size and appearance. Many of these were over 16 hands high—some over 17 hands. One team of six pairs, belonging to Mr. BUCKALEW, were driven at a rapid trot over the intricate tracks of the show-grounds, with as much ease and precision as a pair of well-broke horses. Mr. B. had an equal number of others on exhibition, single and matched. Mr. BISHOP also showed a team of six finely-matched mules, one pair beautifully striped and mottled, the produce of an Arabian horse on a jenny. Mr. JACKSON showed four splendid fellows; and two or three other parties as many more. We trust this exhibition will do more to introduce, (for general work at the North,) this useful, but hitherto despised animal, than any step heretofore taken. We should consider this single result far more than equivalent to the aggregate of this show.

CATTLE.

There were 351 entries. This is not so large a number as are often brought together when the show takes place in the great stock region of the western part of this State; but the *quality* of the animals present were far superior to any exhibition ever held in the State of New York.

Short Horns.—In this department Messrs. MORRIS and BECAR made a large and splendid show; the most famous of which were the handsome Romeo, Balco, Swedish Girl, Catherine Hays, Songstress, Romelia, Bloom. Beauty, Suffolk Maid, Lady Elgin, and Maid of Oxford; most of which, if not all, were imported by themselves. Mr. LORILLARD SPENCER was there with his superb imported bull Augustus, the cows Esterville 3d, and Phoebe 7th. Mr. STEVENS' imported bull, Wolviston, attracted great attention from discriminating judges; for high breeding, quality, depth, breadth, and average fineness and justness of proportion, he is almost unrivaled. But we fear it will take the public some time to learn the true value of such an animal, as great size and a certain airy show are most highly valued by the mass; and yet we should judge Wolviston would weigh about 2,000 lbs., although not yet full grown. This is certainly a good size for an animal in fair working condition. Col. SHERWOOD had three fine young animals present, La Fayette, Red Jacket, and Princess 7th. All these were choice, but more particularly the last.

Mr. KELLY, the President of the Society, showed 14 head, among which were Prince Albert, Phoebe 2d, Red Lady, Bloomer, and Marchioness. His cows are large and fine, and great milkers. Mr. SLATE had a very fine imported heifer, that has just dropped her first calf. She is a highly promising milker. Messrs. HUNGERFORD and BRODIE had two fine imported cows, and some other Short Horns.

Of the foreign stock Mr. HAINES's superb bull Astoria, made much the best show; while Vane Tempest 2d, and young Nymph were highly attractive.

Many of the animals of all kinds had no owner's name on their tickets, otherwise we should have noted more. We beg such to accept this as our apology for not mentioning them.

Devons.—This was a choice display, indeed. The principal exhibitors were Mr. EDWARD G. FAILE, with Wellington, Exeter, Tecumseh, Jenny, Bowley, Victoria, and others. Messrs. WAINRIGHT with May Boy,

Massasoit, Kate Kearney, Helena 2d, and Nora. Mr. MORRIS with Frank Quartly, Birth Day, Edith, Virtue, and Fuschia. Mr. STEVENS with Candy, Washington, and some fine cows. Mr. DE FOREST with a two year old bull, and others.

Ayrshires.—Mr. WATSON was the largest exhibitor of these. He had 13 head present. Messrs. HUNGEREORD and BRODIE had 9 head. Mr. PRENTICE 3, and Mr. VAN BERGEN and others, a number. Several of these were fine animals.

Alderneys.—Mr. J. P. NORTON, of Conn., exhibited a pair of heifers and a young bull of the true high bred stamp, and with such characteristics as we most admire in an Alderney. Mr. COLT, of New-Jersey, showed a young bull, and a very superior cow, fine, deep, and of great butter quality.

Grade Short Horns.—Of these there was a superb exhibition, especially of great milkers. Mr. ROBERT R. MORRIS showed 16 cows, some of which would give from 27 to 32 quarts of milk per day, and were models as to milking form, and make 12 to 15 lbs. of butter per week. Mr. J. BATHGATE showed 8 superb cows, while many others were on the ground whose owners' names we did not find.

Fat Cattle.—Mr. J. B. REED exhibited a grade short-horn ox, which he informed us weighed, when he took him off the boat, 3,995 lbs. He is reasonably fine for his size, and of fair quality. Messrs. O. & G. SHELTON, of Cayuga County, had ten yoke of pure and high bred fat steers, which made a beautiful show as they were driven round. There were quite a number of other excellent fat cattle, but so penned up, when we made the rounds, we could not get at them for examination.

SHEEP.

There were 425 entries of all breeds, which, on the whole, made quite a favorable display.

Long Wool Sheep.—Messrs. HALLOCK and SHERMAN, were on hand with their two famous imported rams, one of the ewes and a superb lamb. Mr. R. A. ALEXANDER, of Kentucky, had a grand buck, just arrived from England. He is one of the largest and best ever brought to this country. His head is particularly fine for such a great sheep. There were some very good ones from Canada also, and elsewhere.

South Downs.—Messrs. MORRIS and BECAR, as usual, were in great force in this department, with their famous imported Webb buck, and a good lot of younger ones, and a flock of ewes. Mr. HAIGHT had some quite nice ones. Mr. WAIT, also, and others.

Fine Wool Sheep.—Of these there were more present than we had anticipated, comprising Mr. CHAMBERLIN's choice imported ileisian sheep, great French Merinos, and other Saxon and Merinos home bred, hardy, fine and good.

CASHMERE GOATS.

Dr. DAVIS, of South Carolina, exhibited a pair of these highly valuable animals, which he selected himself when traveling in Asia, and imported into this country. He has succeeded well in breeding them pure here, and

also with crossing them on the native goats of the country. Their wool is worth at least \$8 per lb. We think untold wealth will yet be realized in the United States, from these highly valuable and easily raised animals.

SWINE.

In this department there was a choice show of 141. Mr. MORRIS exhibited the Essex, Suffolk, and Berkshire; Messrs. WAINRIGHT the two former; Col. SHERWOOD, a beautiful pair of Suffolks; Mr. WILSON a choice Suffolk boar, others pigs, in considerable numbers; and Mr. BRODIE a pair of superior Yorkshires. These two last animals were undoubtedly a Suffolk cross, as they were nearly as fine as this breed, but of greater size. We should think they would weigh from 550 to 600 lbs. each. Mr. LOVE had some still larger and quite fine.

In concluding our observations on stock, we wish to state, that the exhibition in Short-Horns and South-down sheep would have been still better, had Mr. THORNE, of Dutchess County, come out with his stock; but most of it has been so recently imported, he thought advisable to defer sending any thing to a State Cattle Show, till his animals had got over the fatigues of their voyage, and produced some young things here to be exhibited with them.

POULTRY, DOGS, RABBITS, &c.

A few years ago, the fowls present, would have been considered a splendid show; but after the Exhibitions of the National Poultry Society, at Barnum's Museum, in this city, last winter, and that at Albany, the collection here looked rather small. There were, however, some fine birds present, and a good many novelties from the puny Bantam up to the tall Shanghai.

Mr. SAMUEL FAILE and Mr. VAN RENSELLAER, made a good exhibition of the large Madagascar, or Leopard rabbits. Some of these could not be excelled.

We noticed a few Scotch terrier and shepherd dogs on the ground.

The arrangement for the exhibition of all these animals was good. They had plenty of room and were well covered.

HORTICULTURAL DEPARTMENT.

The Vegetables were displayed in a large tent, 60 by 90 feet, near the large halls. We noticed here a fine lot of WOOD's seedling potatoes, said to have yielded 350 bushels to the acre. Mr. HAMILTON MORRISON, of Montgomery, Orange County, exhibited thirty varieties of potatoes, all correctly labeled. We noticed among them the nutmegs, a variety of the first quality, and very hardy. Another contributor displayed several varieties, raised this season from the seed. Many of these were as large as a hen's egg, showing that it is entirely practicable, and not a very long process, to reproduce this bulb from the seed balls.

Mr. J. C. BRENNAN, near 61st-street, had a fine display of vegetables, with his gardener in attendance, to answer inquiries. Here was a hill of well grown sweet potatoes, vines and all. There were more than a peck of them. There were two varieties of okra; a vegetable we believe of African origin, and still confined mainly to the gardens of amateur cultivators. Stewed in the same

manner as spring beans, it makes a very delicious dish. It is worthy of much extensive cultivation. Mr. BRENNAN also showed the Japan pea, and a splendid cotton plant in full flower. We noticed, also, in his collection, the asparagus bean, which yields pods a yard long. It is cut up in pieces of six inches in length, and cooked like asparagus, which it is thought to resemble.

Mr. JAMES HALLOCK, of Whitestown, Oneida County, exhibited samples of the Boston marrow squash, an article that we are rejoiced to see emigrating westward. It is a squash of standard excellence; sells by the quantity in the Eastern markets, from \$35 to \$40 per ton. In good soil, well cultivated, it will produce fifteen tons to the acre. There is no apology for any man who takes an agricultural paper, to raise pumpkins or crooknecks thereafter. He also exhibited fine Carter potatoes. We learned from him that there would be two-thirds of a crop of corn in his vicinity; that the potato crop was pretty good. We heard of no considerable rot among them in all our inquiries.

Mr. D. B. BUCKLEY, of Williamstown, Massachusetts, exhibited fine potatoes, and a large variety of seeds. He is one of our most successful cultivators, and has never been troubled with the rot among his potatoes. His remedy is ashes, applied at three different times during the season.

The Fruits were exhibited in Floral Hall, a tent 80 by 140 feet. It was beautifully trimmed with evergreens and flowers, and under the direction of Mr. PETER B. MEAD, of the New-York Horticultural Society, and Mr. JAMES VICK, Jr. superintendent of the fruit department. As this spot was the center of attraction for the ladies, ample provision was made for their comfort, in a side hall, 20 by 30 feet, adjoining the ice cream stand.

The Flower stands were well filled; and the whole air was fragrant with the breath of roses, reminding one of June.

We noticed quite a large collection of rare hot house plants, from Mr. RICHARDSON, of Westchester County, among them was the Norfolk Island pine, from the South Seas. The foliage is very beautiful; and the limbs, in clusters of six, come out regularly at intervals of about eighteen inches.

Mr. A. P. CUMMINGS, our neighbor of the New-York *Observer*, contributed some fine specimens of rare and well grown plants; among which was, the Camphor tree, East India ginger plant, the allspice tree, club moss, hares foot fern &c.

The highest award of the State Society, a silver cup, was given to the above, as the best collection of house plants in pots.

Mr. D. BOLL of this city received the first premium for the finest roses. He also had a good collection of seedling dahlias. Messrs. THOMAS HOGG and SON of Yorkville, received the first award for the best collection of hot house plants; and Messrs. ELWANGER and BARRY of Rochester the second. Mrs. Wm. NEWCOMB of Pittstown, Rensselaer Co., as usual stood first in the exhibition of German asters, pansies and phloxes; Mrs. JAMES

T. VAN NAMEE of Pittstown of verbenas; Mr. GEO. W. THATCHER of Sunnyside of dahlias.

Mr. H. A. GRAEF of Brooklyn, for the best floral design or ornament; and Mr. WM. S. PARKE of the same city, and JAMES WEIR for the best bouquets.

There were many fine dishes of fruits on exhibition, among which stood prominent the 200 varieties of Messrs. C. M. HOVEY & Co., of Boston, 190 of which were named varieties of pears from their specimen trees.

Messrs. ELWANGER and BARRY, exhibited about an equal number of better grown specimens of pears from their trees; and we were glad to see that Mr. BARRY, the Editor of the *Horticulturist*, had carried out his own suggestion, in a late number of his Magazine, and had marked the name on each pear by writing upon their skin with ink. This adds very much to the interest and utility of these exhibitions. Both of the above collections received the award of a silver cup to each, of the value of \$15.00.

Among the pears a fine dish of the Barlett attracted unusual attention; and we are sure that those who saw those fine large specimens of Doyenne Bossock and Beurre Clai-gneau, will readily recognize them elsewhere. These are among the most promising new pears; and if the quality is at all in keeping with the exterior they must be acquisitions.

There was perhaps the choicest collection of apples ever yet exhibited, although not in so great numbers as we have before seen. Many of the dishes and some collections were fully equal to any thing upon the tables at the show of the Massachusetts Horticultural Society at Boston. Mr. J. W. BAILEY of Plattsburgh, won the silver cup for the greatest number and best specimens of apples. Messrs. A. FROST & Co., of Rochester, the second; Messrs. ELWANGER & BARRY took the first premium on plums; Mr. H. G. DICKENSON of Lyons on peaches; Mr. FROST of Rochester, on quinces; Dr. UNDERHILL Croton Point, on native grapes, and the same to Mr. THEODORE FOWLER of Fishkill. The second best was awarded to Mr. SAUL MERRITT, Dutchess Co. That on best foreign grapes was given to Mr. JAMES POTTER Princeton, N. J., and best one variety to his Black Hamburg. Messrs. HOVEY had fine specimens of the Concord grape on exhibition; and the most experienced pomologists after trial pronounced it a decided "acquisition." Mr. S. S. PENNINGTON, of Whiteside, Illinois, received the first premium of a silver cup of the value of \$15, for the best specimens and greatest variety of apples on the foreign list. They were remarkably fine specimens; and being from the West, were particularly welcome to the examination of pomologists.

On the whole we were highly gratified with this department of the great New-York State exhibition, and think it must have answered every reasonable expectation of the friends of this Society. It cannot fail to scatter seeds of horticultural knowledge far and wide, which will mature hereafter in many a beautiful harvest.

IMPLEMENTS.

Of strictly Farm Implements, the number was large and highly meritorious, though nothing specially new and important. We have never seen better machines at any exhibition. The reapers and mowers were there in greater perfection than we have before noticed, and we were gratified to witness a rapidly advancing improvement in these invaluable machines. Of general manufactures and implements there were few, and unimportant in character.

The Annual Speech, by Hon. JOHN P. HALE, of New Hampshire, was an able and off-hand effort, and calculated to do much to aid in forwarding the great cause he so eloquently advocated. His audience was large, intelligent, and attentive throughout.

The character of the spectators struck us as being the most intelligent and respectable we ever before saw assembled in so large numbers. We did not observe a rowdy, or boorish, or drunken man on or around the premises during the "four days" exhibition; and the police, so generously tendered by the Mayor, had an easier duty than arranging the ingress or egress of a popular concert. Large numbers of the intelligent farmers—those who make it an amusement as well as a profession, among us and around us—were there, and highly gratified by the display.

The first and most of the second day of the opening of the exhibition was rainy, and few consequently attended. The last two days were very fine, and the number of visitors respectable. Owing to the distance of the show grounds from the settled part of the city, and the great lack of sufficient conveyance to them, nothing like as many persons were present as there would have been, could the exhibition been held in a place like Madison-square. As it was, about \$10,000 were taken; located lower down, we have no doubt the receipts would have been from \$25,000 to \$30,000.

As our journal is national rather than sectional, and as a few only are interested in a long list of premiums, we do not publish them. They will be found at length in the *Tribune* and other daily papers of this city; and will also be published in the next volume of the Transactions of the New-York State Agricultural Society. To those interested in these matters, we would refer them to the above sources for information.

For the American Agriculturist.

SHOW OF MIDDLESEX COUNTY, CONN. EFFECT OF EXCESSIVE CAUTION, ETC.

MIDDLETOWN, Conn., October 4, 1854.

THE annual festival of the Middlesex County Agricultural Society was celebrated in this place last week. The exhibition of manufactured articles was not equal to former years, but the collection of fruits was very fine for this place.

The live stock exhibited the second day was fine, even for Middlesex County. One yoke of working oxen from Portland weighed 5,054 pounds!

A man lost his life here a few days since by accidental poisoning. He had procured two phials of medicine, each containing tincture of aconite—one to be taken internally and containing but little of the poison, the

other containing more, to be applied externally. The phials were properly labeled, and the man properly cautioned both by the physician and by the druggist who put up the prescription—but to no purpose. After using the medicine several days, he unfortunately made the fatal mistake, and in an hour after he was a dead man.

Query?—When a person undertakes to guard against a particular mistake, the danger of which he is forewarned, does not his excessive caution sometimes render him even more liable to the very mistake, than if only using ordinary care? JAY JAY.

GOING TO THE FAIR.

BY MRS. FRANCES D. GAGE.

BEN FISHER had finished his harvesting,
And he stood by the orchard gate,
One foot on the rail and one on the ground,
As he called to his good wife—Kate.
There were stains of toil on his manly hand,
The dust of the field on his hat,
But a twinkle of pleasure was in his eye
As he looked on his stock so fat.

"Here, give me the baby, dear Kate, you are tired,
I fear you have too much care,
You must rest and pick up a little, I think,
Before we go to the fair.
I'd hate to be taking fat oxen, you know,
Fat hogs, and fat sheep, and fat cow,
With a wife at my elbows as poor as a crow,
And care-wrinkles shading her brow.

"Can't go," did you say? "Can't afford the expense?"

I know, Kate, our crops ain't the best,
But we've labored together to keep things along,
And together we'll now take a rest.
The orchard is bare, but old Brindle is prime,
And Lily and Fan are a show,
Your butter and cheese can't be beat in the State,
So up to the fair we will go.

"You've ne'er seen a city, and Cleveland is fine,
Ne'er seen the blue billowy Lake,
Ne'er rode in a rail car, nor been in a throng,
So, Kate, this journey we'll take,
And garner new feelings, new thoughts and new ways,

If we find those that suit as we roam,
And garner up strength with our head, heart and hands,
For the love and the duties of home.

"I sometimes have thought, Kate, as I plodded along,

For months, o'er the same weary ground,
That a fellow who had such a really hard time,
In Ohio nowhere could be found.

But when I've been called from my home for awhile,

And seen how the rest get along,
I've come back to my toil with a light, cheerful heart,

And 'there's no place like home,' was my song.

"I wonder that mothers don't wholly despair,
Who ne'er from their cares get away,
But walk the same tread-wheel of duty for years,
Scarce stopping to rest night or day.

I don't wonder they grow discontented sometimes,
That their feelings grow raspy and cold,
For toil never-ending, and labor uncheered,
Makes women—and men sometimes scold."

Kate looked up with a smile, and said, "Ben, we'll go;

There may be better oxen than ours,
Horses swifter on foot, and finer by far,
Better butter and cheese, fruit and flowers,
But there's one thing I claim I know can't be beat
In the whole Yankee nation to-day,
I'd not swap him, I know, for a kingdom to boot—
That's my 'gude man;' and Kate ran away.

[Ohio Cultivator.]

THE only way to keep sweet corn of any variety for winter use, is to partially cook and then dry it; or put it in a close jar, or other tight vessel. Corn nicely kept in this way, is very good, as we had abundantly tested, years before the Stowell corn was ever heard of.

KEEPING WINTER APPLES.

A great many persons lose their winter apples, not because they will not keep, but because they do not know how to keep them. We commend the following to the attention of all. Recollect that too much importance cannot be attached to keeping apples in a cool place, but where they will not freeze.

The keeping of apples and other fruits depend very much upon the care with which they are gathered, and the place in which they are deposited: hence a few hints on the subject will not be valueless to the orchardist and gardener.

Late autumn and winter apples belong to that class of fruits which are gathered before maturity, and ripened in the fruit room or cellar; and they should be picked when they have received from the tree all the valuable elements the season will allow it to give them. English gardeners have a rule that no fruit should be suffered to remain on the trees after they cease to vegetate, and this is in general a good one. The apples above spoken of, as well as pears of the same class, may remain ungathered until there is danger of injury from frost, as the sun and air, and the still remaining vigor of the tree seems necessary to their perfection and maturity.

Apples designed for long preservation should as far as practicable be picked by hand, carefully and separately, and when they are not wet by dew or rain. They should be handled so as not to bruise them in the least, as carefully almost as eggs or glassware. Lay them gently upon the floor of a cool dry room, a foot deep, to sweat and season for two or three weeks; and then, on a clear dry day, sort and pack the apples in clean dry barrels, filling them so full that the apples cannot move after being headed in. The very best, which will keep longest, may be wrapped up separately in soft paper before packing, or they may be placed in layers with dry chaff around and between them.

Most cellars and ground floors are too damp for the perfect keeping of apples through the winter and spring, and also of too variable a temperature—the latter should not vary much from forty degrees. If an upper room can be so prepared as to retain about the same degree of heat, dryness, and darkness, it is a very desirable locality for the preservation of fruit, not only apples, but pears, grapes, &c. To the preservation of the two last named, considerable attention has recently been given.—*New-Yorker*.

ABOUT CRANBERRIES.

To Keep Cranberries.—Gather them when quite dry, cork them closely in dry bottles, and place in a cool, dry cellar. They will also keep in bottles or in casks of water, the latter being the mode practiced in the north of Europe and in this country in which it is sent a long distance without injury; the fruit is put in a perfect state into tight barrels filled with water and headed up.

Cranberry Jelly.—Make a very strong isinglass jelly; when cold, mix it with a double quantity of cranberry juice, pressed and strained; sweeten and boil it up, and make it into the desired shape, by straining into the proper vessels; use good white sugar, or the jelly will not be clear.

Cranberry and Rice Jelly.—Boil and press the fruit, strain the juice, and by degrees mix it with as much ground rice as will, when boiled, thicken to a jelly; boil it gently, stirring it, and sweeten to your taste; put it into a basin or form, and serve with cream or milk.—*Germantown Tel.*

GATHERING HOPS.—Hops should be picked when they are full grown and begin to be fragrant; by no means let them remain long-

er, as a strong wind or rain will injure them greatly. Spread them away to dry.

**CURING HAMS.*—The following are the recipes for curing hams, which received the first and second prizes at the late annual show of the Maryland State Agricultural Society:

To every 115 lbs. of Hams take 3 ozs. saltpetre, 1½ do. saleratus, 3¼ lbs. alum salt, 6 gals. of pure water, 2 lbs. of ground spice. When the meat is perfectly cold, pour in the above combination until the meat is entirely covered, let it remain 6½ weeks, then remove and hang it up with the hock down; when dry smoke it well with green hickory wood, take the advantage of a clear and dry day for smoking, and on the occasion of wet weather, open the smoke house door, to prevent skippers, &c. Should bag about the middle of February.—*Ex.*

For 1,000 lbs. of hock meat, half a bushel of fine salt, half a gallon of molasses, three lbs. of brown sugar, two and a half of saltpetre ground very fine. Mix all the ingredients together in a large washing tub, and rub the meat therewith until the whole quantity be absorbed. The meat must be taken out of the cask once a week and rubbed with the pickle it makes. The first two times you take it out add at each time a plate full of alum; it ought to remain in pickle five or six weeks, according to the size of the meat. *Chickopee Journal.* WM. H. HARRIOT.

For the American Agriculturist.

THE CORN CROP AND FAMINE.

To one who has not been an observer, and knows nothing of the chicanery resorted to by interested persons, as prompted by interest to produce high or low prices, the articles in many of the papers of the day, relative to the present drouth and corn crop, would lead him to suppose us on the very threshold of an alarming and distressing famine. The farmer who has a surplus to sell—though there will be but few of that class this year—is interested in producing the impression on the public mind, that the damage to the crop is far greater than it really is. The speculator is first interested in buying low, and, picturing to himself higher profits than ever before realized, continues to buy largely at high prices, gets up a perfect panic as to supply and demand, and at the close of the season wonders where all this supply comes from or how produced with such a drouth, sees prices fall, his hopes disappointed, and thousands that he fancied as starving surrounded with plenty. I do not pretend to say what will be the result of the corn speculation the present season, or what will be the price; but all know that supply and demand control the price of every commodity, and before anything like an approximate price could be given by any one, it would first be necessary to know the demand for speculation, as this controls prices as much, and frequently more, than the demand for consumption. But while it is a fact that the corn crop in many portions of the Union has been seriously damaged, in no one section of the country, of any considerable extent, has there been a universal failure. In almost every portion of the Union the so-called bottom lands have yielded their accustomed crops, while only a portion of the uplands have very seriously suffered, and a still smaller portion have failed entirely. This I know to be the case in this country, while some of the river bottoms, and low lands generally, as the farmers themselves say, have produced the best crops ever known.

Though the corn crop is far below the average, the wheat and oat crop in almost every section of the country was a good one.

If one farm, one neighborhood, one County, or even one or more States, should have entirely failed, this would be no occasion for alarm. Adjoining lands will furnish ample surplus to supply the wants of their neighbors. As to a famine, such a thing we never had in the United States, and probably never shall have, possessed as we are with such a variety of soil and climate—the one soil never failing from either drouth or rains without benefitting another—as in the case of our up and low lands.

The breadth of land in the cultivation of corn the present year is greatly beyond any former one. This has been caused in the old States by last year's high prices stimulating farmers, and in the new States by immigration; whence a large portion of soil is put under cultivation for the first time, which never suffers so much from drouth as to seriously injure the crops. And this increase of the new land opened for cultivation must continue for many years to come, until the greater portion of the vast and fertile lands of the North-western States and territories shall have been brought under cultivation. Many of these will be the most productive in the Union, as I have no doubt many of the lands of Illinois and Iowa would stand a succession of corn crops for one hundred years, without requiring any improvement or showing any very perceptible diminution of crops. When all these lands shall have been taken possession of, our population may be as dense as some of the thickly-peopled States of Europe, and even then it would require a greater famine than ever scourged any part of the habitable globe, to bring about a famine so alarming as some would have us believe the present shortness of the corn crop will produce. A. SUBSCRIBER.

SHEEP BREEDING.

BREEDERS of sheep—no matter of what variety—should be cautious in selecting their bucks, and look, not only at the good qualities of the individual, but also to his adaptation to the ewes, choosing an animal that will amend any imperfections in wool or carcass which may be observable in the females. The requirements of their flock of ewes should be particularly noticed, and a careful separation of them made, so as to ascertain more accurately their precise defects, and to point out with greater certainty the peculiar kind of buck necessary to rectify these defects. This should be done before procuring the buck—not to buy first, and then try and suit the ewes to him afterward.

Never Purchase a buck from an unknown flock. An inferior buck from a flock of well-known repute will produce better stock than an accidental good one from an inferior flock. By all means keep to a "good strain;" adhere to flocks of well-known and deserved celebrity; you are far more certain as to the result. It is always better for a breeder to hire a buck than to buy one. Bucks "now-a-days" are so highly kept, so pampered, that the vast number of them are defective stock-getters. A yearling buck is generally supposed to be fully equal to serve 75 to 80 ewes; but a two year old buck should not have more than 70 to 75.

In making choice of a buck to suit the ewe flock, regard should be had to every requirement. Neither wool nor mutton ought to take precedence, both must be held of equal value. If any quality is to be discontinued, or of necessity given up for the time, let it be beauty, or symmetry, or some minor point. These are truly good in their place, but for these never give up the main qualifications—a good fleece, a fat back, and a full symmetrical proportion of great substance. As far as possible, put a short-legged buck to a long-legged ewe; a full-chested buck to a narrow

ched ewe; a heavy-wooled buck to a light-wooled ewe; and so on as judgment dictates, endeavoring to obtain from the male what is wanting in the female.

In breeding what are termed "half breeds" or "grades," great care should be taken to obtain bucks from good flocks, or the end will be defeated. The very best bucks should be used, possessing every good qualification of wool, mutton, and symmetry. It is quite a mistake to suppose that any bucks will do for half breeds. No such thing. If half-bred sheep are to retain favor with the grazier, they must be bred with every care and attention to the many qualifications. Many breeders use buck lambs for this purpose; this is wrong; *no breeder can tell what a lamb is to make in his future life.*

In all cases use the best buck, or the best kind of a buck you can obtain, and *be not too nice about the price.* I have known many flocks to make from seventy-five cents to a dollar and a half per head more than others of the like size, solely from better and more correct breeding; and the difference is far greater as they grow up and are fattened.

[London Farmer's Magazine.]

FINE WOOLED SHEEP IN SOUTH CAROLINA.

—The Charleston *Mercury* says the experiment of rearing fine breeds of sheep for wool, in the upper part of South Carolina, promises to be completely successful.

HUSK BEDS.—No one who has not tried them, knows the value of husk beds. Straw and mattresses would be entirely done away with, if husk beds were once tried. They are not only more pliable than mattresses, but more durable. The first cost is trifling to have husks nice and clean; they may be split after the manner of splitting straw for braiding. The finer they are split the softer will be the bed, although they are not likely to last as long as when they are put in whole. Three barrels full, well stowed in, will fill a good sized tick, that is after they have been split. The bed will always be light, the husks do not become matted down like feathers, and they are certainly more healthy to sleep on.

Feather beds ought to be done away with, especially in warm weather. For spring, summer, and fall, husk beds ought to be "all the go," and such undoubtedly will be the case, when they are brought into use. There is no better time to procure husks than when the corn is harvested, and the husks will be much nicer and cleaner when the corn is cut up at the bottom and put in stacks. They do not become so dry and weather-beaten. It is calculated that a good husk bed will last from twenty-five to thirty years. Every farmer's daughter can supply herself with beds (against the time of need) at a trifling expense, which is quite an inducement, now-a-days.

PROFITS OF SHADE TREES.—Let a farmer plant out by the road side 100 trees, at a cost of \$50, (and this is a liberal estimate,) in ten years' time that farm will sell for \$500 more than it would without them; and I venture the assertion, the owner would not have them removed for that sum.

Whatever adds to the value of real estate, and has an *increasing value*, must be profitable. It cannot be otherwise. Now, if shade trees do this, the question is settled. Will any sane man contend that the shade trees in Cleveland, Rochester and New-Haven, or any other city where numerous planted, have not done much to add to the value of real estate in those places? What is true of the city would be equally true of the country.

POTATOES AND APPLES.—Potatoes are very abundant in our market at the present time. The wholesale prices for the former at Quincy Market are, for peach blow and whites, 60 to 70 cents a bushel; for Chenangoes, \$1 10 to \$1 20 a bushel; for white blue-noses, \$2 50 to \$3 a barrel. Good eating apples are not so plenty as they were some days since. They are sold from \$1 75 to \$2 a barrel. Winter apples, especially Baldwins, are abundant at \$1 50 a barrel. Squashes (marrow) are plenty at \$1 50 to \$1 75 per hundred pounds, according to quality.—*Boston Traveller.*

"THE LITTLE BUSY BEE."

The honey-bee belongs to the class of insects which live in a perfect community—indeed, bees can flourish only when associated in large numbers as a colony. In a solitary state, a single bee would be almost as helpless as a new-born child, and would be unable to endure even the ordinary chill of an autumnal night.

If a family of bees is examined before it sends off a new colony in the spring, three different kinds of bees will be found in the hive. 1. One bee of peculiar shape, commonly called the queen bee. 2. A number of large bees, called drones. 3. Many thousands of a smaller kind, called workers, and similar to those which are seen on the blossoms. A large number of the cells will be found filled with honey and bee bread, while vast numbers contain eggs and immature young, a few cells of unusual size and shape being devoted to the rearing of young queens.

The queen bee is the only perfect female in the hive, and all the eggs are laid by her. The drones are the males; and the workers are females, so imperfectly developed that they are incapable of laying eggs, and retain the instincts of females only so far as to give the most devoted attention to feeding and rearing the young. The queen bee, or, as she ought more properly to be called, the mother bee, is the common mother of the whole colony. She reigns, therefore, most unquestionably, by a divine right, as every good mother is, or at least ought to be, a queen in the bosom of her own family. The fertility of the queen bee is very great. She will often lay as many as three thousand eggs in a single day.

As the common bees never attain the age of a single year, a constant succession of young bees must be added to the hive; and, therefore, no colony can long exist without the presence of this important insect. She is as absolutely necessary to its welfare as the soul is to the body. The queen bee is treated by the bees as every mother ought to be by her children, with the most unbounded respect and affection. A circle of her loving offspring constantly surrounds her, testifying in various ways their dutiful regard, offering her honey from time to time, most affectionately embracing her with their antennæ, and carefully smoothing her beautiful plumage. If she wishes to travel over the combs, they not only make way for her, but most politely back out of her presence, and ever seem intent on doing all that they can to promote her comfort and happiness. How ought such a beautiful example to put to the blush those undutiful children who treat their mothers with irreverence or neglect, and who, instead of striving with loving zeal to lighten their labors and save their steps, treat them more as though they were servants hired only to wait upon every whim and to humor every caprice!

If the queen is taken from the bees, as soon as they ascertain their loss, the whole colony is thrown into a state of the most intense agitation; all the labors of the hive are

at once abandoned; the bees run over the combs in wild despair; and often the whole of them rush forth from the hive, in anxious search for their beloved mother. When they return to their now desolate home, by their mournful tones they manifest the deepest sense of their deplorable calamity. Their note at such times is of a peculiarly sorrowful character, sounding something like a succession of wailings on the minor key, and can no more be mistaken by the experienced apiarian, or bee-manager, for their ordinary happy hum, than the piteous moanings of a sick child can be confounded by an anxious mother with its joyous crowings, when overflowing with health and happiness. Even after the bees have recovered from their first distraction of grief, they plainly manifest that some overwhelming calamity has befallen them. Often those that have visited the fields, instead of entering the hive with that dispatchful haste so characteristic of a bee returning to a happy home, linger about the entrance with a dissatisfied look. Their home, like that of a man who is cursed rather than blessed in his domestic relations, is such a melancholy place that they enter it only with reluctant and slow-moving steps.

The defense of the colony against its numerous enemies, the construction of the combs, the providing of stores, the rearing of the young, and, in short, the whole work of the hive, the laying of eggs excepted, is carried on by the industrious workers. There may be gentlemen of leisure in the commonwealth of bees, but, most assuredly, there are no such ladies, either of high or low degree. The queen herself has her full share of duties; for it must be admitted that the royal office is no sinecure, when the mother who fills it must superintend daily the proper disposition of some two or three thousand eggs. It is very true that the drones

"On others' toils in pampered leisure thrive,
The lazy fathers of the industrious hive."

But then, as a penalty for this exemption from labor, at the close of the summer they are all ignominiously put to death.

LANGSTROTH.

For the American Agriculturist.
THE TA FEU.

THE mention of this sent me the other day to my books, for something relating to Chinese farming. The result of my researches proves that they know the value of manure, and how many inches there are in an acre. Perhaps you may think them of sufficient interest to circulate with your own valuable observations. That relating to the planting of grain may excite the experimental genius of some go-ahead farmer, and thus benefit thy brethren of the Plow:

The Chinese permit no part of their lands to be applied to the purposes of pasture; every field sustains a perpetual succession of crops. This makes cattle scarce, and occasions a scantiness of animal manure. The Chinese, however, are convinced of the great utility of manure in cultivation. The collection of manure, says Staunton, is an object of so much attention with them, that a large number of old men and women, as well as children, incapable of much other labor, are constantly employed about the streets, public roads, banks of canals and rivers, with baskets tied before them and holding in their hands small wooden rakes to pick up the dung of animals, and offal of any kind that may answer the purpose of manure; but above all others, except the dung of fowls, they prefer, like the Romans, (according to the testimony of Columella,) night soil. This manure is mixed sparingly with a portion of stiff loamy earth, and made into cakes

and dried in the sun. In this state it sometimes becomes an article of commerce, and is sold to the farmers, who never make use of it in its compact state. Their first care is to construct large cisterns for containing, beside these cakes and dung of any kind, all sorts of vegetable matter—as leaves, roots and stems of plants, mud from the canals, offals of animals, and even to the shavings collected by the barbers. With all these they mix as much animal water as can be collected, or of common water as will dilute the whole, and in this state, generally in the act of putrid fermentation, they apply it to the plowed or broken ground. In various parts of the farm, and near paths and roads, large earthen vessels are buried to the edge in the ground, for the accommodation of the laborer and passenger who may have occasion to use them. In small retiring-houses, built also upon the brink of roads and in the neighborhood of villages, reservoirs are constructed of compact materials, to prevent the absorption of whatever they receive, and straw is carefully thrown over the surface from time to time to stop the evaporation. And such a value is set upon the principal ingredients for manure, that the *oldest* and most *helpless* persons are not deemed wholly useless to the family by which they are supported!

The deficiency of cattle, which makes all these arts of procuring manure necessary, still makes the supply too scanty. It is seldom applied to the raising of grain, but is reserved for the purpose of procuring speedy and successive supplies of culinary vegetables. The seeds are steeped in *liquid* manure before they are sown, and liquid manure is from time to time applied to the roots of the plants.

The Chinese are too sparing of their grain to sow broadcast. They are convinced that by drilling they procure much more luxuriant crops. Every kind of grain, therefore, is either sown in drill or dibbled. The drills run north and south, as that is supposed to be the best direction. The fields are not laid out in ridges, but every where present a level surface. H. McK.

CALIFORNIA PRODUCTS.

Specimen Sweet Potato.—The Sacramento Union editor has been called on to inspect a sweet potato of extraordinary size. It was grown on Allmond's Ranch, at Oakwood Farms, on the Sacramento River, thirteen miles below the city. This specimen measures longitudinally two feet and three inches, and latitudinally seventeen inches, and weighs five pounds. It is of a clear yellow color, without speck or blemish, and apparently is as sound internally as externally.

Another Vegetable Wonder.—The Marysville Herald tells of two enormous squashes on exhibition in that city. One weighs eighty-four pounds, and measures five feet eight inches in circumference. They were both grown on the south side of the Yuba, two miles from Marysville.

Mammoth Muskmelon.—The Marysville Express tells of one grown on the Kennebec Ranch, which exceeds in size any of the monsters of this class which have yet appeared. It measured four feet in circumference the longest way, two feet eleven inches around the center, and weighed thirty-eight pounds.

Watermelon Wonder.—The Empire County Argus claims a watermelon of forty-five pounds weight and thirty-three inches circumference.

The Biggest Yet.—The Sacramento Journal beats the San Joaquin Republican's watermelon. They have been shown one in Sacramento weighing fifty-two and a half pounds and measuring two feet ten inches in length and two feet nine inches in circumference.

Horticultural Department.

NEW-YORK HORTICULTURAL SOCIETY.

This Society held its regular meeting at its Rooms, No. 600 Broadway, on the 2d instant, Vice-President JOHN GROSHON in the Chair, and PETER B. MEAD, Secretary.

Mr. WM. S. CARPENTER laid on the tables several specimens of a new seedling Peach, which gives decided promise of being an acquisition. It is very large—equal in size to Crawford's Late and Early. Some specimens were over eleven inches in circumference. Flesh pure white to the stone; no red; and is juicy, sprightly, of good flavor, and a good bearer. Its large size, color, and lateness of ripening, will make it particularly desirable for preserving. Last year it did not ripen until the middle of October. This year, owing to the drouth, the peach ripened two weeks earlier. The present is the second season of its bearing, and it seemed worthy of particular notice.

Mr. R. G. PARDEE presented a Winter seedling Pear, from Connecticut, of fair quality.

Mr. D. BOLL exhibited a handsome variety of Double Balsams.

Mr. WM. CRANSTON exhibited a fine specimen of Brugmansia Knightii.

Mr. BURGESS, from Glenwood, presented some large well-grown Pears, from trees transplanted last Spring. They were Louise Bonne de Jersey, Duchesse d'Angoulême, and Vicar of Winkfield.

Letters were read from Messrs. WILSON G. HUNT, and LOUIS BAKER.

Mr. THOMAS HOGG, Jr., Chairman of the Fruit Committee, reported favorably on Mr. CARPENTER's peach, naming it "*Carpenter's White*." Adjourned.

THOROUGH DRAINAGE FOR GRAPE VINES.

We have, in our garden, two Isabella vines, both well covered with fruit. The older and larger vine, which ought to give the finer fruit, has many of its bunches badly mildewed, though its exposure is on the south side of the house. The younger vine has scarcely a mildewed grape upon it, and the bunches are very uniformly ripened, though it stands upon the south-east side of a board fence, and has little sun after ten o'clock A. M. The latter has a very perfect drainage, the bottom of the border being laid with ox sculls. The former has no such provision to carry off the surplus water, though it is abundantly furnished with bones. We attribute the whole difference to drainage.

In preparing vine borders, make provision for thorough drainage, and make the border deep, broad, and rich. If we were to prepare a border, as thoroughly for a vineyard, we think we should have Isabellas, and Catawbas of much larger growth, and finer quality. If we could in this way get bunches of two or three pounds' weight, instead of half a pound, it would pay for the extra expense. Thorough drainage, we are convinced by our experiment, is a great safeguard

against the mildew, and hastens the maturity of the fruit.

Now is a good time to prepare the borders, though we have found Spring much the best time for setting the vines. A southern exposure with a little slope is the best location for a border, but a trench four feet wide, at least, and four deep; and at the lower end, see that there is some provision made for the water to pass off. Put a layer of coarse cobble-stones at the bottom, say six inches thick—then a layer of bones, and then your compost, and surface earth. This will give you grapes worth eating.

BLACK KNOT ON PLUM TREES.—A writer in the *Cultivator* says that Mr. WM. SMITH, of Ballston Centre, this season "removed all the diseased branches from his trees, and around a portion of them set out the tomato plant, leaving a part uncared for. Those with tomatoes at the roots have no knot whatever, while those not treated in this way, were full of black bunches the same as last year."

We shall be glad if the above proves a permanent remedy to this spreading disease; but we have our doubts, whether it was the tomato or the superior cultivation around the trees, which prevented the black knot. We trust W. S. will persevere in his experiments. A few years' test will be requisite to fully decide upon the efficacy of the tomato plant.

ALLEN'S HYBRID GRAPE.—The horticultural friends of Mr. J. F. Allen have been for some years aware that he has been experimenting, to produce a hybrid grape, possessing the requisites which no one hitherto has combined, of sure and early ripening, rich flavor, and abundant crop, and freedom from "foxiness." All lovers of good fruit will be gratified to learn, that his long and patient efforts for this object have at length been crowned with complete success. He has obtained a white grape of the full size of the Isabella, of a flavor unsurpassed by the best hot-house grapes, totally free from the "foxy" taste and smell, and which ripens securely by the middle of September. He has also a purple grape, possessing similar qualities, but not quite so early. So says the *Salem Gazette*.

PEARS ON QUINCE STOCKS.

Mr. Barry, of New-York, remarked he that had seen it stated in several newspaper paragraphs, that the cultivation of the pear on quince stocks had proved to be a failure. He regretted to have such statements sent abroad. They are not correct. He considered it a great blessing to the country that pears could be cultivated on quince stocks, because it enabled thousands upon thousands of our citizens to enjoy delicious varieties of fruit years earlier than they otherwise could. Perhaps the best way to check this erroneous impression would be for the Society to recommend a list of pears that succeed best on quince stocks. He had prepared a brief list of sorts, and would submit it for the consideration of the meeting. All the pears enumerated were not, indeed, of the best quality, but they have been successfully proved on the quince. Before giving the list he would say, that the best quince stocks were the Fontenay and another variety. The common apple or orange quince of this country, is not a suitable stock for budding. It may grow well

for one or two years, but will ultimately fail.

Pears for cultivation on quince stocks: Rostiezer, Beurre d'Anjou, Beurre Diel, Duchess d'Angoulême, White Doyenne, Louise Bonne de Jersey, Fig d'Alençon, Urbaniste, Easter Beurre, Glout Morceau, Pound, Calttillac, Vicar of Winkfield, Napoleon, Beurre d'Amalis, Beurre d'Aremberg, Soldat Labourer, Beurre Langeleir, Long Green of Cox, Nouveau Poiteau, and St. Michael Archange. The list was adopted by the society.

WELLINGTONIA GIGANTEA.

BY EDWARD SPEARS.

In the *Illustrated London News* of February 11 last—a copy of which is inclosed—you will find an excellent botanical description, accompanied with an engraving, of the celebrated Arbor Vitæ of San Antonio Creek, in the County of Calaveras, California.

The gentleman who gives the scientific biography of this wonder of living vegetation, was well known to me during his residence in this country, and it is no flattery to say, a more competent person could not be found to delineate its physical features. Beside extensive journeys through nearly every portion of Oregon and California, Mr. Lobb is preëminently fitted to form a correct judgment, from a thorough acquaintance with the order of one-bearing trees—having traversed the Cordilleras of South America, from the equator to near the Straits of Magellan: these countries, with North-west America, affording the most magnificent specimens and varieties of this class of plants. Mr. Lobb is not only an experienced and diligent collector, but his taste has constantly led him to take the greatest interest in the Conifera, and his accuracy and care, I can say from personal knowledge, it is almost impossible to exceed.

The description by this gentleman, of our celebrated tree, was made to the *Gardiners' Chronicle*, prior to the 11th February; Mr. Lobb having sent living specimens of the youthful brothers of the Calaveras giant, with a quantity of the seeds, to London, for the examination of the scientific, and for the purpose of propagating the species in England. The man of the *Chronicle* thereon dilates and exfoliates to that degree, that to any other but a lover of trees and flowers and running brooks, it would be thought expedient to confine him within the square of a soda-water bottle crate; but, finally, you conclude it would be wiser to sew him up in a straight jacket, for, after a most inviting and delightful description of the tree, he worries his brains into a vortex of names and quandaries, and finally falls from his excursive flights and heights into the domains of Nature's history, to proposing as a name for our *Arbor Vitæ*, or if you please, in Spanish *Arbolazo Grandissima*—what do you think? what name could you possibly exercise your jealous California guessing at, by which you would arrive at a satisfactory solution of the enigma? Give it up, for I am impatient to let you know. He suggests and accords the name of a soldier—a son of Mars—lately clothed in a Field Marshal's dress in the army of Britain, and called Arthur Wellesley, whilom Duke of Wellington, commander of her military forces till he grew gray with service, and then quietly laid down his life at the finality of his corporeal existence, amid the benedictions of his countrymen, for sticking to them and by them through thick and thin. He says it ought to be called the "Wellingtonia gigantea," and then goes on to call it so, and actually describes it as such; thus making the first assumption of a name, which, with most European and English read-

ers, will cleave to it, unless we enter our vigilant and vigorous protest. And, in the name of California, I shall assume to do so; for a more preposterous piece of cockneyfied nonsense never filtered through the brain down into the fingers through the ink of the pen of any denizen of the commercial Babylon of the modern world.

Without detracting one iota from the claims and character of the great Duke of Wellington, who was all his life a very monument of plain, sagacious, practical good sense—let us ask what right his admiring countrymen in the botanical or military line have for flying off to California to fasten his fame and glory to the most wonderful specimen of living, spreading presence of the great Creative Author of all things, who planted this vegetable pyramid as a memento of his handiwork, when the Sierra Nevada was lifted from the volcanic centers of our planet, and emerged, with its snow-crested peaks, from a primeval ocean, which laved its bases! And the beneficent Father of bountiful creation, 3,000 or 5,000 years ago, planted with His own paternal hand in a silent valley of our California, on the side of the eternal hills, this sign of his love to that portion of the family of his children who should reside for all mundane time in this partition of the earth's extremities, after passing through centuries of wadings in human blood, and petrified in their souls in the servilities of religious faiths and fanatical bigotries—yes, after, 6,000 or 60,000 years of experience, to arrive at the shores of the Ocean of Tranquility, and they and their children sit them down with pleasant and grateful thoughts under its wavy foliage and spreading branches—realizing the typical comparison of the all-embracing wings of Nature's Universal Parent. Or, if left as a monument to men, to testify of the truth of the Chronicles of the Democratic Theocracy of the Jews, who, like true cosmopolites, have scattered from the cradles of humanity in the Asiatic Palestine, at that point of their history when Joshua, their first leader after Moses, wearied with the slaughter of the Amorites—"And Joshua said, in the sight of all the hosts of Israel, 'Sun, stand thou still upon Gibeon, and thou, Moon, in the valley of Ajalon.' And the sun stood still and the moon stayed, and hasted not to go down about a whole day." And at this great concurrence of human passions, when the mechanism of the universe of the Living God was arrested for a space of time, as asserted in the most ancient collection of historical and literary documents, we may imagine our Californian Arboreal Methusaleh was planted to mark a momentous epoch in the cycles of wordly events.

Now, I say, hath not Wellington's name been stuck by Englishmen to boots, shoes, dogs, cats, carts, horses, carriages, to streets, towns, cities, rivers, ships, counties, to pulling infants, regiments of red-coated soldiers, inns of rest for man and beast, to every conceivable thing under the sun, so as to weary and disgust the mind of independent man, born of the forest and prairies, with the very sound of his title? Then, why seek to fasten it on the magnificent specimen of nature's handiwork, placed in a far-off valley in the bosom of the snowy mountains of the Northern Pacific, where its roots were laved with the waters from the primeval snows of our Cordillera; for 6,000 years depositing their flakes of gold at its roots, to attract men from every clime to come and rest under its beneficent pyramidal pile of leafy and bounteous refreshing green foliage of shade.

The heart of every Californian ought to rise up indignant at this assumption of a stranger, and in a still greater degree at the American savage who dared, with his barbarous ax, in open day, to slay this mighty

giant of our mountains, built by the hand of God in the virginal youth of California, when the foundations of the eternal hills were laid by His majesty and omnipotence.

If Californians or botanists wish to bestow the name of a human being on this majestic plant, there are sufficient names in the history of our State and country far more applicable and proper than those fagged out of old Europe.

But the tree, I conceive, ought not to bear the name of a human being. It is God's tree. His gift to the children of California, to repose under its cooling shade in the heat of the noonday sun, and rest their wearied bodies from exhausting labor. Therefore Californians ought to baptize this primary wonder of botanical science, and not Atlantic or European strangers. ALEX. S. TAYLOR.
[California Farmer.]

PRESERVATION OF GRAPES.—A traveler who lived at St. Petersburg during the winter season, states that he ate there, the freshest and most beautiful grapes he had ever seen. To preserve them they should be cut before being entirely ripe. Do not handle the berries; reject all damaged ones; then lay the grapes in a stone jar holding about thirty gallons. The mouth should be narrow, the grapes should not touch each other. Fill the spaces between them with millet. Cover closely with a stone cover well fitted and cemented. Over this paste a thick paper, and let it be hermetically sealed so as to entirely exclude the air. In this tight jar the grapes ripen fully, and acquire a flavor seldom attained by any other method, and are preserved for two years in the best condition. [Boston Cultivator.]

GAS TAR IN HORTICULTURE.—A discovery, which is likely to be of great advantage to agriculture, has just been reported to the Agricultural Society at Clermont (Oise). A gardener, whose frames and hot-house required painting, decided on making them black, as likely to attract the heat better, and from a principle of economy he made use of gas tar instead of paint. The work was performed during the winter, and on the approach of spring the gardener was surprised to find that all the spiders and insects which usually infested his hot-house had disappeared, and also that a vine, which for the last two years had so fallen off that he had intended to replace it by another, had acquired fresh force and vigor, and gave every sign of producing a large crop of grapes. He afterwards used the same substance to the posts and trellis-works which supported the trees in the open air, and met with the same result, all the caterpillars and other insects completely disappearing. It is said that similar experiments have been made in some of the vineyards of the Gironde with similar results. [Galignani's Messenger.]

THE BUTTERFLY PLANT.—The *National Intelligencer* says that a specimen of the singular and beautiful Butterfly Plant is now in bloom at the National green-house in Washington. The blossoms are very large and yellow, with reddish brown spots, and are moved to and fro with every breath of air, so as to resemble very much the gaudy insect from which it derives its name. The plant was brought from the Island of St. Thomas in the U. S. frigate Raritan.

PICKLES.—An excellent way to make pickles that will keep a year or more is—drop them into boiling hot water, but not boil them; let them stay ten minutes, wipe them dry, and drop into cold spiced vinegar, and they will not need to be put into salt and water. The above is my wife's rule which she has proved to be a good one. R.

American Agriculturist.

New-York, Wednesday, Oct. 11.

COVERS FOR BINDING NOT MAILABLE.

WE have received several orders, to mail covers for volumes XI and XII. It is entirely unsafe to send them by mail, as they are quite large and would unavoidably be spoiled. From nearly every town in the country there is some book merchant or other dealer, sending to New-York for packages by express or otherwise, and we will always send a cover to any point in this city where such a package is being put up, on the receipt of 25 cents. These covers are a matter of no profit, but we cheerfully procure and forward them whenever it will accommodate any subscriber and facilitate his keeping his numbers together and getting them bound in uniform style at a cheap rate. These volumes, if kept, will, in the future, become more and more valuable. The Old Series of Ten Volumes we had stereotyped, and have reprinted several large editions to meet the constant demand for them. The New Series, commencing with volume XI, is too large to be stereotyped without an enormous expense, so that after parting with some fifty volumes, which is all we now have of volume XI, we can supply no more of them. Our advice, then, is, carefully preserve all the numbers, and have them stitched or bound. Of volume XII we have a larger edition.

SELECTING SEED.

We have, upon our table, a pod of the Scipio bean, with nine perfect beans in it. It is one of the best sorts of pole beans, and usually grows with four and five in a pod, rarely with six. Four years ago, we found one in our garden with six, and it was the only one we found on quite a large number of hills. We carefully saved the pod, marked and planted them the next year by themselves. We had several pods with six beans in it from the produce, and some with seven. These were again kept by themselves, and planted, and bore many with seven pods, and one with eight. We thought we had reached the limit of our improvement with these; but this year we find them still progressive, and our faith is so much strengthened, that we now think Scipio hereafter may be produced with a dozen beans in a pod. A bean patch looks much better with long well filled pods, and is far more profitable.

Almost every garden product may be improved by a similar selection of seeds, for a succession of years. The present season should be improved to make the selection for such articles as are still in the garden. Take your seed corn from the stalks that bear the most ears, tie up the ears by the husks, and hang them in a dry place, where you can find them next spring. Choose the finest squashes, cucumbers, egg plants, melons, peppers, beets, carrots, &c., and put them where you can find them when wanted. The seeds should be carefully dried, put in

papers, labeled and dated. It is well also to put on the weight of the fruit, from which seeds are taken, that you may see the improvement the next season. In nothing are we more prone to be careless than in saving the seeds of fine fruits and vegetables.

We are fully persuaded, that time cannot be more profitably spent, than in making this selection. There is a fixed law in nature, that we may avail ourselves of, to make almost unlimited improvement in the product of the garden. Market gardeners understand the advantage of this practice, and are very careful in raising their own seeds, and make exchanges with each other in preference to purchasing at the seed stores. Every one who owns a garden would find it equally for his advantage.

Aside from the improvement of fruits and vegetables, it is one of the best means of mental improvement. The man who pursues this course realizes something better than fine fruits for his pains taking. His mind is kept constantly alive to the beautiful processes of vegetation, and every visit to his garden is a source of the purest enjoyment. There is no relaxation from professional cares and business life like it.

GATHERING SQUASHES.

It is already time they were plucked from the vines, and put in a dry cool place, where they may have the sun during the day, and be kept from frost at night. They should be handled with great care, as the least bruise is soon followed by decay, which will spread through the whole fruit. We have tried several methods of keeping them, but have found no place equal to an upper room that receives the heat of the kitchen stove. The old fashioned kitchen with wooden beams over head, well filled with spikes for hanging up articles, was the perfection of temperature for preserving squashes. A cellar will not answer well if you wish to keep them through until spring. A dry atmosphere and perfect freedom from bruises, are matters of the first importance. If these fruits are guarded, even the marrow squashes may be kept with little care until March.

GREASE OR SCRATCHES.

A correspondent inquires as to remedies for them. The best and most simple we have met, are those in the "Modern Horse Doctor," by George H. Dadd, M. D. See pages 292 to 298.

We had an aggravated case of the scratches last month, in a fine horse in use before our buggy wagon. As he was nicely groomed every day, his feet kept well washed and clean, we were rather surprised at it. Upon thinking the case over, we concluded he had been given too great a proportion of Indian and oil meal in his food during the hot weather of the past summer. We instantly stopped this, and reduced him to two quarts of oats and four quarts of wheat bran per day; and as he had been constantly stabled with hay, we turned him on to a grass lot to run through the day. The fresh grass and bran operated upon his system like a gentle

loosening medicine, and consequently saved the necessity of giving him aloes, or some gentle purgative, which would have been requisite in cold weather when there was no grass. The small quantity of oats kept him from falling away in flesh too rapidly. His feet and fetlocks were now carefully washed for several days in succession, every morning in warm soap suds, and then poulticed with smart-weed. Flax seed, slippery elm bark, or anything softening, that tends to reduce inflammation, would have done just as well. After four or five days of this treatment, we left off the poulticing, and then simply washed his feet and legs four times each day in sea-water, which was running near our stable. Brine of moderate strength would have done just as well as sea water. In about a fortnight the horse was well enough to use gently, and in two weeks more was perfectly cured.

In all cases of disease we would recommend first ascertaining the cause of it, and this being removed, pay particular attention to his food and water—for these are medicines—pure air, and cleanlines. These alone are often sufficient to cure most diseases; but if they do not produce the desired effect, next, apply the most simple medical remedies. In all aggravated cases or such as you do not fully understand, apply at once to a good veterinary surgeon—not an ignorant quack. If none is at hand, then consult your village doctor, if he does not think it beneath his dignity to alleviate the sufferings of a poor dumb animal. But he must recollect that a horse is not a man; before he prescribes, he must know something of its anatomy and internal organization.

GRAPES FROM THE CROTON POINT VINEYARD.

—Dr. R. T. Underhill is again in town with his choice Catawba and Isabella grapes. We do not know exactly how it is, but whether we have a deluge or a drouth, or something half way between, the Doctor always gets a good crop of grapes. We suppose we ought to infer that enlightened science added to long experience in their cultivation, combine to annually bring about this desirable result; but science too many of us ignore; and as for experience, some look to have that come by nature. However, be this as it may, yet to those who wish to test the superior quality of the grapes in question, we would say, call at Dr. Underhill's depot, 293 Broadway, where they will find them daily fresh from the vineyard, and in quantities to suit any length of purse, from very short to very long.

PUMPKINS.—The most effectual method of preserving pumpkins, during the winter, is to select the largest and most perfectly matured, and having deposited a stratum of dry straw on a close floor, place them thereon—not so near as to touch each other, and cover them carefully with straw on taking especial care to fill in the interstices or space between the pumpkin, till the receptacle is filled, or until you have laid by as large a quantity as your inclinations or necessities require.

LABORS APPRECIATED.

A correspondent informs us that, two years ago, he invested five dollars in agricultural papers, and that a series of articles in the *American Agriculturist* reduced to practice, have been of actual profit, sufficient to pay a like sum for many years to come." The series alluded to, were the five on cabbage in the last volume.

By following out the suggestions there made, he has grown a fine crop of cabbages, and realized a much larger return than from any ordinary farm crop. Yet multitudes of farmers still take no agricultural paper, and think they can't afford it. Their wiser neighbors invest their capital in the best half dozen agricultural papers they can find, raise the crops, and pocket the money. Which is the better economy?

GREAT NEW-ENGLAND HORSE SHOW.

This will take place at Brattleboro', Vt., on the 17th, 18th, and 19th days of this month. The premiums range from \$20 to \$300, amounting, in all, to \$2,500. The grounds to be used are the same as those used by the Vermont State Fair. They are well adapted to the purpose. We hope they will have a profitable time. The following named gentlemen constitute the board of officers.

President—Hon. LEMUEL HURLBURT, Winchester, Ct.

Vice-President—Sanford Howard, Boston, Mass.; Benjamin Thurston, Lowell, Mass.; Silas Hale, South Royalton, Mass.; L. M. Hale, N. H.; J. S. Walker, Claremont, N. H.; Robbins Battel, New-Haven, Conn.; Gen. E. B. Chase, Lyndon, Vt.; David Hill, Bridport, Vt.; M. Carter Hall, Bennington, Vt.; Dr. Marshall, B. Mead, Providence, R. I.; Dr. E. Holmes, Augusta, Me.

Corresponding Secretary—William S. King, Boston, Mass.

Recording Secretary—Evelyn Pierpoint, Rutland, Vt.

Treasurer—Calvin Townsley, Brattleboro' Vt.

Committee of Invitation—Solomon W. Jewett, Middlebury, Vt.

Executive Committee—B. B. Newton, St. Albans, Vt. G. M. Atwater, Springfield, Mass. Lyman P. White, Whiting, Vt.

THE FAIR AT COLLINS, CATARAUGUS COUNTY, NEW-YORK.

BY MINNIE MYRTLE.

How I came out into this *far country* will not interest you particularly, but perhaps some of the things I see here and there may be worth recording, though they are not among things wonderful or renowned.

I heard there was to be a Fair some ten miles distant; and I thought, for your benefit, Messrs. Editors, I would take a peep at a country fair. I happen to be domiciled among the Seneca Indians just now; and I was therefore escorted by one of the genuine sons of this noble race, whose physiognomy sufficiently indicated his origin, and whose moccasins were proof positive that he made no attempts to conceal it.

Our way was for several miles through the forest, where the tall pines which the fire had scathed and blackened were frowning

upon us on every side; and here and there we had a glimpse of a clearing, or heard the woodman's ax with its long echo—the premonitory sounds that the plowman and the reaper are soon to come.

It is one of the brightest of autumnal days, and the roads in every direction are thronged with farmers' wagons loaded with fruits, vegetables, and women and children, on their way to the scene of festivity; for thus it proved to be—an exhibition of *fair ones* come out for a day of rural sport on the green, rather than an exhibition of the homely fruits of the soil.

Our eyes were first saluted by long rows of tables covered with snowy linen, and furnished with such good things as notable housewives have always in store for the gratification of those who wish to "eat, drink, and be merry." It is a long time since I have seen any genuine juice of the apple, but here it was—not red like the juice of the grape, but yellow, and not less rich than in the days of yore, when I sipped it from the barrel, or the groove in which it flowed lazily from the press, with a straw, and smacked my lips as city people do now when they sip *sherry cobbles* in the same way. I did not taste the cider to-day; but I confess—just to you, Mr. Editor—my mouth did water a little; and I was obliged to obey the command of Solomon, who spoke from experience, and not look upon it, lest I should be tempted to do what would be considered quite ungentle, if not sinful.

I hurried along and looked at the corn, which was quite as yellow; and recalled associations not less delightful, when I went into the meadow with the harvesters, and sat on a yellow pumpkin to pull off the husks, and thought I was a great *helpmeet*, when very likely I was only a *hinder-meet*. There were baskets of potatoes that would be no discredit to California, and I saw specimens of the egg-plant which excelled all I have ever seen of this vegetable before. There were squashes and pumpkins of no mean capacity, and apples almost as large, various species of plums, and cart-loads of melons, all betraying that the farmers in this region are proud of their calling, and believe in progression.

Of the plows and winnowing mills, I was no judge; but the rich roan-colored Short-horns and red Devon cattle I could more fully appreciate; and the chickens strutted and crowed equal to any I heard at your famous Poultry Show last Winter.

At dinner I tasted of all the good things I could obtain, in order to know if the wives and daughters were progressing also, and could pronounce most of them very good.

There were cheeses exhibited so large that I should not like to risk my reputation in guessing their circumference; but that which was cut in generous slices for the table was very far from good. It had the fault which is so common to the cheese of thrifty housewives—of having runnet enough in one for half a dozen. This is owing to their great haste in *running up the curd*; they are so anxious to get it into the press early, that they use a great quantity of run-

net, rather than wait for a small quantity to perform the office, which it would effectually do in the course of time, and make a much better cheese. Now some experienced dairyman will wonder how I came to be so wise; but I shall only say that I have done such a thing as to *run up a curd*, and I have seen them *run up* a thousand times by a woman who *never failed* in having excellent cheese.

But my greatest amusement here was in watching the people, some two thousand of whom had gathered together, and occupied a grove and orchard of many acres in extent, grouped under every tree, old men and matrons, young men and maidens, in their holiday-dresses, chattering and laughing, exemplifying rural felicity in all its perfection. I did not see upon the ground anything stronger than cider, and heard no sound of vulgar revelry or evidence of anything but healthy exhilaration and rational sport.

The Seneca National Band favored us with soul-stirring music, and they in their gala-day red and white costume, with the young maidens of their people, much more becomingly and tastefully dressed than our fair-haired damsels, added not a little to the pleasing and picturesque effect of the scene.

Fairs have become the grand holidays of the rural districts, and when conducted like this, must prove a pleasant recreation to the sons and daughters of toil—affording them a good opportunity of talking over their crops, and comparing products stimulating a healthful competition and promoting industry. I was pleased with my day's observations; but, after several inquiries, I learned that the *Agriculturist* has too few readers in these parts; and probably many will not know my approbation. I recommended it very cordially, believing as I do that it is the best Agricultural paper in the country; and very sure I am, if it could become the weekly visitor in every family, whether farmers or not, there would speedily be a great improvement in the appearance of our fair land; and as it is as valuable to the housekeeper as the cultivator of the soil, most heartily do I recommend it, for our kitchens and dairies do not keep pace, I fear, with our orchards and gardens. "Knowledge is power;" and when farmers and their wives are universally convinced of this, our rural population will become appreciated as they deserve, and occupy the position and exert the influence they should, and which they can exert in no other way.

HOW MUCH WE EAT IN NEW-YORK.—During the three months ending the 1st inst., two hundred and nineteen thousand six hundred and thirteen animals were slaughtered for food in this City. During the nine months of the year, the total number of animals offered up on the altar of appetite, reached 700,714, or, at the rate of 7,966 per week, or nearly one million per year! The population is nearly six hundred thousand—that is an average of about one and three-fourths of an animal to each inhabitant, beside the millions of chickens, ducks, turkeys, fish, and other et ceteras too tedious to enumerate!

Scrap-Book.

"A little humor now and then,
Is relished by the best of men."

From the Knickerbocker Magazine.

EXTRACTS FROM THE EDITOR'S TABLE.

A Hard Head.—Some idea of the hardness of a genuine Sambo's head may be gathered from the annexed paragraph, which we find in the *Daily Eagle*, printed at Memphis, Tenn. A 'colored pusson,' well known about town as Old Kit, while passing under a new three-story building, in process of erection, a brick-bat fell from the hand of a brick-layer on the wall above, and in descending came in contact with the negro's head. The resistance was great, and the brick-bat was broken in two. After recovering from the temporary stun, he addressed the brick-layer with: "I say, you w'ite man up dar, ef you don't want yer bricks broke, just keep 'em off my head!"

Satire by Inversion.—By the by, we have a good many clever anecdotes of the odd and bright sayings of the dark people, but we have seldom heard a keener satire than was expressed by a colored boy, as related to us just now, by a friend upon whom no good thing was ever lost: It seems that he was looking through a grave-yard fence upon the tomb-stone of a villager who in life had been known as a rather close-fisted citizen, whose principal care had been the greatest good of the greatest number, the greatest number with him having been number one. After a pompous inscription, the following passage of Scripture was recorded: "He that giveth to the poor, lendeth to the Lord." "Dat may be," soliloquized Sambo, "but w'en dat man died, de Lord didn't owe 'im a red cent! E'yah! e'yah! e'yah!" Now if that isn't a good specimen of satire by inversion, we have misconceived its drift.

Cured of Lispering.—"Did you go to Dr. —, to have him cure you of lispering?" said a gentleman in Louisville to a little boy who had been tongue-tied.

"Yeth, thir," answered the lad.

"What did he do to you?"

"He cut a little thring there wath under my tongue."

"Did he cure you?"

"Yeth, thir."

"Why, you are lispering now!"

"Am I, thir? Well I don't pertheive that I lithp, *exthept when I go to thay thickthpenth!* Then I alwayth notithe it."

Happy lad! "Where ignorance is bliss, 'tis folly to be wise."

Free Passes.—One of the greatest sources of annoyance and perplexity to managers of railways is the indiscriminate and interminable applications by all sorts and conditions of men, (and women, too, for that matter,) for free passes. The following is a *fact*, and there is *ice* in it: The manager of a railroad in this State, who had been beleaguered by pastors and people for passes to a Methodist Conference, which he courteously but firmly resisted, was at last solicited by a brother to pass *nine* ministers to a neighboring town to attend a funeral. The pass was given, and on the following day the Company was called on by the brother to redeem the pass in *money*; our brother modestly giving as a reason that the nine ministers of the gospel had found it convenient to take another conveyance, and *he had paid their fare!*

Shanghais and a short Corn Crop.—Our old friend A. H. S., up the river, fairly anticipated our hint. The Shanghai mother and brood, cabined, cooped, confined, arrived as

per invoice, in good order and condition. The little fellows of the party presented rather a singular aspect when they first came to hand, their elder brothers having picked off all the feathers from their high-backed rumps. But all have flourished abundantly. Their at first inordinate drum-sticks have been growing to legs ever since, and they have become very familiar, feeding almost out of hand. And how they *do* eat!—and the national corn-crop a short one, too! Two of the young roosters have already rehearsed two or three crows; but their "clarion of the morn" sounds more like a wind-broken tin horn, feebly blown, than any thing else. The mother is fructifying. She lays an egg every day about 11 o'clock, and lets us know it by an exultant "cut—cut—cut—cut—dar—cut!" when she has got through. The Shanghai family live on the best of terms with the native brood, heretofore spoken of; sharing generously each other's crumbs and kernels in exact proportion to their comparative nimbleness and strength!

Lightning and Thunder.—There's point in the following, if it *was* said by a child: Our Georgy is something over six years old, and has a keen eye for every thing beautiful in nature, although he sometimes makes it ridiculous in attempting comments. The other day we had a fine thunder-storm, with almost incessant flashes of lightning. Georgy and myself were sitting in the barn, admiring the lightning, which darted from cloud to cloud, and then to the ground; and he wanted to know what made it "go so," illustrating its zig-zag motion with his hand. I could not explain it so that he could clearly understand, and was obliged to tell him I didn't know. He thought a moment and said: "I s'pose God thinks it looks prettier crooking round in that way!" Presently there came a succession of tremendous crashes, and the little fellow jumped up and clapped his hands, exclaiming, "Aren't those good ones, father? That's better than cannon, isn't it? You do n't have to stop to load!"

A BEAR STORY.

WE have small confidence in the "old Ohio pilots," they tell such awfully large stories. They have no conscience in their exaggerations. We have been among them "long ago." We started from Olean Point, in the County of Cattaraugus, a great place in those days, on the Alleghany river. We went down to its confluence with the Ohio, on a lumber raft, and then we got on board of a periogue of some four or five tons burden, and went ahead. Cincinnati was comparatively a small place then. It was not a great and beautiful city, with long, wide streets, cutting each other at right angles, reaching away in a long vista of shade trees, and lined with magnificent business structures and elegant dwellings. Along the majestic Ohio were great old forests of gigantic growth, where now are broad farms, teeming with agricultural wealth. There were occasional broad lagoons and marshes, swamps covered with lowland trees, and it is a simple truth, that, when the sun was running low and the shadows of evening were gathering around, the mosquitoes were out in their might, and they *were* an extraordinary breed. We had an "old pilot," who was an original in his way, and the stories he told of the early settlement, and of the incidents occurring in his experience in the "olden time," were astonishing.

We remember a bear story of his telling. He seemed to believe it himself, for he told it with a gravity of face that would ill comport with its falsity. We do not vouch for its verity, we simply tell it as the "old pilot"

told it to us, one pleasant afternoon, as we were gliding along quietly down the Ohio, fighting mosquitoes and watching the sun, as he was sinking down into the western wilderness, casting the dark shadows of the woods far out over the waters.

"Twenty years ago," said the "old pilot," as he lighted his stump of a pipe and seated himself on a whisky keg, "there warn't a great many people along the banks of the Ohi-o, except ingins and bears, and we didn't like to cultivate a very close friendship with either of them, for the ingins were cheatin' deceivin', scalpin' critters, and the bears sometimes had an onpleasant way with 'em that one didn't like. I came out for some people over on the east side of the mountains, lookin' for land, with a company of four men who had hunted over the country.

"We came down the Alleghany in two canoes, and shanteed on the Ohio, just below where the Alleghany enters it. We hid our canoes and struck across the country, and traveled about exploring for four weeks. We saw a mighty deal of good land that trip, and when we got back to our shantying ground we were tuckered out, as you may well believe. We rested here a couple of days, laying around loose, and taking our comfort after a fashion of our own. Early one morning, while my comrades were asleep I rose and went across the river after a deer for we wanted venison for breakfast. I got a buck and was returning, when what should I see but a bear swimming the Ohi-o, and I put after him 'in chase; I soon overhauled the critter, and picked up my rifle to give him a settler, when I found that in paddling I had splattered water into the canoe, wetting the primin' and making the thing of no more use than a stick. I didn't understand much about the nater of the beast then, and thought I'd run him down and drown him, or knock him on the head. So I put the canoe right head on towards him, but when the bow touched him, what did he do but reach his great paws up over the side of the boat and begin to climb in. I hadn't bargained for that, and felt mighty onpleasant, you may believe, at the prospect of having such a passenger.

"I had'n't time to get at him with my rifle until he came tumblin' into the bow of the dug-out, and as he seated himself on his stern, showed as fine a set of ivory as a body would wish to see. There we sat, he in one end of the dug-out and I in the other, eyeing one another in a mightily suspicious sort of way. He didn't seem inclined to come to my end of the canoe, and I was principled agin goin' toward his. I made ready to take to the water on short notice, but at the same time concluded to paddle him ashore if he'd let me do it quietly. Well, I paddled away, the bear every now and then grinning at me, skinning his face till every tooth in his head stood right out, and grumblin' to himself in a way that seemed to say: 'I wonder if that chap is good to eat.' I didn't say a word to him, treating him all the time like a gentleman, but kept pullin' for the shore. When the canoe touched the ground he clambered over the side and climbed up the bank, and giving me an extra grin, started off into the woods. I pushed the dug-out back suddenly, and gave him, as he left, an extra war-whoop, which seemed to astonish him, for he quickened his pace mightily, as if quite as glad as I was to part company. I've never tried to drown a bear since, and shan't undertake to do it again in a hurry."

[Albany Register.]

MODERN.—"Blanchy, my son, run to the store and get me some sugar." "Excuse me, ma, I am somewhat indisposed this morning. Send father; and tell him to bring me a plug of tobacco."

HONORABLE COURTSHIP.

We heard a very pretty little incident the other day, which we cannot help relating. A young lady from the South, it seems, was wooed and won by a youthful physician living in California. When the engagement was made the doctor was rich, having been very successful at San Francisco. It had not existed six months, however, when, by an unfortunate investment, he lost his entire "heap." This event came upon him, it should be added, just as he was about to claim his bride. What does he do? Why, like an honorable and chivalrous young fellow as he is, he sits down and writes the lady every particular of the unhappy turn which has taken place in his fortunes, assuring her that, if the fact produced any change in her feelings towards him, she is released from every promise she has made him. And what does the dear, good girl? Why, she takes a lump of pure gold, which her lover had sent her in his prosperity as a keepsake, and having it manufactured into a ring, forwards it to him, with the following Bible inscription, engraved in distinct characters on the outside:

—"Entreat me not to leave thee, or to return from following after thee; for whither thou goest will I go, and whither thou lodgest will I lodge; thy people will be my people and thy God my God; where thou diest will I die; and there will I be buried; the Lord do so to me, and more also, if aught but death part me and thee." The lover idolised his sweetheart more than ever when he received this precious evidence of her devotion to him, both in storm and sunshine. We may add, that fortune soon smiled again upon the young physician, and that he subsequently returned to the north to wed the sweet girl he loved, and who loved him with such undying affection. Reader this is all true. Young ladies who read the Bible as closely as the heroine of this incident seems to have done, are pretty sure to make good sweethearts, and better wives.

[Liverpool Weekly Journal.]

RUFUS CHOATE.

RUFUS CHOATE is a picture to look at, and a crowder to spout. He is about six feet six or six feet seven in his socks, supple as an eel and wiry as a corkscrew. His face is a compound of wrinkles, "yellow janders and jurisprudence." He has small, keen, piercing eyes, and a head shaped like a mammoth goose egg, big end up; his hair, black and frizzled, much resembling a bag of wool in "admirable disorder," or a brush heap in a gale of wind. His body has no particular shape, and his wit and legal "dodges" have set many a judge into a snicker, and so confounded jurors as to make it almost impossible for them to speak plain English, or to tell the truth for the rest of their natural lives. Rufus is great for twisting himself up, squirming himself around, and prancing, jumping, and kicking up the dust when steam is up. His oratory is first-rate, argumentative, ingenious, and forcible. He generally makes a "ten strike" down judge and jury at the end of every sentence. He is great on flowery expressions and highfalutin "flubbubs." Strangers mostly think he is crazy, and the rest scarcely understand what he is about. He invoices his time and elocution 4,000 per cent over ordinary charges for having one's self put through a course of law.

Rufus Choate is about 50 years of age, perhaps over. He is considered the ablest lawyer in New-England, or perhaps in the United States. His hand can't be deciphered without the aid of a pair of compasses and a quadrant. His autograph somewhat resembles a map of Ohio, and looks like a piece of

crayon sketching done in the dark with a three pronged fork. He has been in the Senate, and may be, if he has time to fish for it, President of the United States. [Exchange.]

A BULL AND BEAR FIGHT.

A COMEDY RATHER THAN A TRAGEDY.—On Saturday last a grand bear and bull fight was advertised to come off in Auburn, California. At 10 o'clock in the morning a crowd of about two thousand persons had assembled to witness the encounter between bruin and his bullship. A large amphitheater had been erected, with ample accommodations for the spectators, underneath which they crowded in anxious expectancy, to witness the rare entertainment. The sports of the day commenced with a cock fight; after which the bull, Chihuahua, was ushered into the ring. The bear, a full grown animal of the grizzly species, was led from his cage, tethered by a rawhide lariat and a chain. Chihuahua surveyed his antagonist, pawed the dirt over his neck, and prepared to pitch into bruin, who, not relishing such sport, made one bound, freed himself from the thongs which bound him, and commenced ascending the seats on which sat the spectators. A scrambling scene ensued which beggars description.

Bruin succeeded in attaining to the fourth tier of seats, when he either fell through or leaped to the ground, on the heads of the dense mass below. One unfortunate gentleman raised the canvass to effect his escape. Bruin perceiving the opening made, darted through, overturning the man in his passage, and made for the deep canon which runs by the foot of the town. In ascending the hill he overtook Mr. Courtney, of Mad Canon, and with one stroke of his paw almost denuded him. Happily, however, he sustained no other injury than the loss of his "unmentionables." The gentleman who was upset in making his escape through the canvass suffered a severe contusion, and had his head gashed to the skull from the center of his forehead to the crown. Meanwhile, the rage of the bull having reached boiling heat, with a bound and bellow, he dashed through the crowd, overturning all in his way, and in the opposite direction from Bruin, disappeared in the woods. The scene, altogether, our informant assures us, was indescribable.

HOG STORY.—We heard a capital anecdote about hogs the other day. In Madison and other counties, mast and acorn are very scarce. It abounds, however, in the County of Estill. Many hogs were driven there, which the Estill people considered an infringement on their rights. Councils were called to deliberate how to rid themselves of the nuisance. Many plans were proposed, but finally, after a good deal of debate, one was adopted. It seems that hogs have a great fear of bears. Accordingly the skin of a bear was procured, and a large sow was caught from one of the droves. She was covered with the bear skin and then let loose. She immediately returned among the droves, but on her approach all the hogs took flight, pursued by the sow with the bear skin. It is stated that since this experiment not a hog has crossed the confines of Estill County.—*Louisville Jour.*

SHORT CROPS AND A SURPLUS OF PIGEONS.—The plentifulness of pigeons in this region this year is attributed by the knowing ones to the drouth at the West, and the consequent barrenness of the fields upon which they usually rely for sustenance. There is one man in Southwick now who has a collection of 250 dozen living pigeons, which he is fattening for market. They consumed fifteen bushels of corn last week. Others in the same town have similar quantities on hand. [Springfield Republican.]

REMARKABLE COINCIDENCE.

A correspondent of the Petersburg (Va.) *Express*, writing from Charlestown in that State, relates the following series of incidents, which, if true, are certainly very singular:

Washington was accustomed to wear two seals on his watch, one of gold, and the other of silver. Upon both of them the letters 'G. W.' were engraved, or rather cut. The seals he wore as early as 1754, and they were about his person on the terrible day of Braddock's defeat. On that day he lost the silver seal. The gold one remained with the General until the day of his death, and was then given by him to his nephew, a gentleman of Virginia, who carefully preserved it until about seventeen years ago, when in riding over his farm, he dropped it, and could never recover it. The other day, the gold seal, lost seventeen years ago, was plowed up, recognised from the letters 'G. W.' on it, and restored to the son of the gentleman to whom Washington had presented it. At almost the same moment, the silver seal, lost in 1754, just one hundred years ago, was plowed up on the site of the battle in which Braddock was defeated, and in like manner recognized from the letters 'G. W.' so that in a very short time the two companions will be again united. I have this whole statement from the most reliable source possible, namely, from the gentleman himself, who has thus restored to him these precious mementoes of his great ancestor. The affair is but one more proof of an oft stated maxim, that truth beggars fiction in strangeness. I repeat, there is not the slightest exaggeration or misstatement in the matter, and no room for mistake. In legal phraseology, the proof excludes every other hypothesis.

A DROVE OF HEIFERS vs. AN ALPINE BEAR.—The *Gazette de Savoie*, relates the following somewhat singular adventure, which is said to have taken place in the Commune of Villard (Upper Savoy): Two shepherds who had charge of a drove of heifers, had just laid out their provisions on the ground in order to take their meal, when they were suddenly pounced upon by a large bear, who, after having devoured all the provender he found, threw himself on one of the shepherds and began to tear his clothes to pieces. While the bear was thus occupied, the heifers, eighty in number, formed into a semicircle, and making a regular charge on the intruder, drove him from the ground and released their keeper from certain death. The other man had taken to flight at the first appearance of bruin, and having climbed a tree, witnessed the whole affair in safety.

AN APPLE IN THE MOUTH.—About eighteen months ago, a young man eating an apple, got one of the "pips" fixed in a decayed tooth, which occasioned him great pain, but was totally unable to be extricated. At length the pip, by dint of pushing was driven down below the tooth into the gum, and no more pain was felt. Six weeks ago, however, a swelling was seen in the gum, and ultimately an abscess formed, medical men examined it and found the pipin had begun to germinate! It was a habit of the young man to keep cotton in his tooth, and this is supposed to have hastened vegetation.

BULWER, the novelist, in a letter to a gentleman in Boston, said: "I have closed my career as a writer of fiction. I am gloomy and unhappy. I have exhausted the powers of life, chasing pleasure where it is not to be found."

THE COCHIN CHINA FOWL.

WE copy the following amusing article from the *Derby Reporter* (English). It is the best defense of this breed of fowls we have yet seen; and if the pullets will lay so well at *five months old*, and when the thermometer is 18° below freezing point, and in addition make so perfect a cross with the Dorking, we will patronize the beauties to a certain extent. Another year we will experiment with them and the Dorkings, and give our readers the results.

A brother member of mine in the Royal Agricultural Society, and a most active member of its council, states somewhat complainingly, that Mr. Penchard has made more money from a few Cochin China hens, than he (Fisher Hobbs) has been able to do from a choice flock of six hundred ewes. Very likely. "There is nothing new under sun." A lucky Dutchman once sold a tulip for a dozen sheep, eight fat swine, four fat oxen, two hogsheds of wine, a suit of clothes, and a silver drinking-cup. Nay, more—5,000 florins was a common price for the rarest kinds of tulips, such as *Semper Augustus* and *Admiral Liefken*, and even so late as 1835, Dr. Mackay informs us, that a tulip root was sold in London for £35 sterling. Such is the infatuation which sometimes besets the public mind. Forty guineas for a Cochin China cock is not, therefore, an unparalleled folly, for so long as a feather-bed is in request, a dead fowl will be a better thing than a rotten tulip; and the poultry mania of 1853 not so hazardous a speculation as that which beset the Dutchman in 1636. A 3,000-florin tulip-root was once munched with great relish by a hungry sailor, in Amsterdam, who mistook the bulb for an onion, and quietly pocketed it while talking to its infatuated owner. We opine that a Cochin China fowl could not have been pocketed so easily, although the nether garments of a Dutchman are always very capacious.

But can this popular "fancy" continue? Will the Cochin China, or Shanghai fowl, sustain its reputed preëminence over the "natives" of these islands? A gallant naval captain uttered the following prophecy in 1852:

"Yes, Sturgeon's breed may be forgot,
And Punchard's called a worthless lot,
And Andrew's fame be less;
But still in Poulterers' shops so neat,
In Leadenhall-market or Mount-street,
The Dorking breed shall long compete
With triu.nph and success."

And, alas! the prophecy is will-nigh fulfilled. Cardinal Woolsey fell not more rapidly from the favor of "my king," nor the dashing Devereux, the proud and lordly Essex, from the heart and smiles of *The Maiden Queen*, than has the short-tailed buff Cochin, from the admiration and esteem of John Bull. It was really painful to watch the indifference with which this popular favorite of yesterday was treated at Birmingham.

"But yesterday a king
And armed with such to strive,
And now thou art a nameless thing
So abject, yet alive."

It is too bad. The Hallelujahs of yesterday were more deserved than is the contemptuous indifference of to-day. Granted (for a moment) that they are tough when on the table—granted that they are ugly in the yard—granted that they eat like an alderman, and *crow* continuously and disagreeably; yet the fact remains that they are hardy, and lay eggs in considerable quantities. They lay, too, at a time when eggs are worth something, and when other fowls find it quite as much as they can accomplish to supply the materials of warmth and growth to their own bodies, without furnish-

ing eggs for the breakfast-tables of their liege lords.

These fowls have, moreover, an excellent quality, which we should be glad to see copied by some bipeds without feathers. *They stay at home, and attend to their own business.* So little of the wandering, gossiping propensity do they possess, that they are invaluable to the citizen in confined quarters. The smallest fence will suffice to keep them from trespassing; a wire net, three feet high, is a sufficient indication to them of the rights of property, for which they have a most conscientious respect.

They arrive at maturity early, frequently laying eggs when only five months old; and, from their frequent desire to incubate, are most useful to the farmer who wishes to bring chickens into the market at an early date. They will also improve the general race of farm-yard poultry by judicious crosses. A pullet from a cross between the Cochin China hen and a Dorking cock possesses, in a large degree, the special qualities of each bird. It grows rapidly, and to a large size. The yellow legs of the Cochin, so suggestive, when on the table, of oil-cake-beef, and other gross compounds, are often displaced by the white foot of the Dorking, and moreover the flesh is almost as juicy and as good as the last-named bird; while, when alive, it produces more eggs than the Dorking, of equal size, and of a richer color. Although the thermometer stands at 10° below freezing-point, a hen of this breed, with no especial advantages of warmth or shelter, with no "greaves," fat, or animal food, is supplying us five times a week with an egg of good size (six to the avoirdupoise pound), as beautiful in color as those of her dam from the Celestial Empire, and rich in flavor as the eggs which her great paternal grandmother deposited upon the sunny slopes of Dorking, in Surrey. She performs this duty, too, in a true Wellingtonian spirit, coming off her nest with quiet dignity, making no grand cackle about the glory of an achievement, which might well inspire the lazy hens around her with envy, if not with admiration. Therefore, the introduction of these fowls from "The Flowery land" is a national benefit, for the farmer who keeps Shanghai hens and Dorking cocks will always have large fowls, and a supply of handsome eggs for the market. But let him not think to perpetuate the race by breeding from the offspring of this cross. Better to sell their eggs at forty for a shilling, for the patriotic purpose of pelting a political renegade, than place them under a hen to be warmed into a bundle of bones, muscles, and feathers, into a walking, eating creature, that would require the genius of Adam himself to supply it with an appropriate name. For as sure as the young mongrels would chirp, so surely would they reverse the excellent properties of their parents, and, by a rapid process of degeneration, *their* offspring would grow up more ravenous than a distorted Cochin, and almost as eggless as an Ornithorhynchus or a Kangaroo.

THE GINGER OF COMMERCE.—The ginger of commerce is the produce of a plant growing in both the East and West Indies. In its appearance it resembles a reed, but the stems arise from a root similar to the root of the garden sweet flag, or iris. Like the root of this flower, that of the ginger plant spreads and increases in size every year. From the upper surface of the ginger-root arises in the spring, a green red-like stalk, about two feet and a half high, which bears narrow lance-shaped leaves. The flowers of the plant, which are white and lilac, grow on a separate stem. The ginger we employ as a spice is the root, to obtain which the plant is cultivated in much the same way as potatoes

are, and when the stalks have withered, the roots are dug up. The best of white ginger, being scraped in preparing it, is less in size, not being so thick or knotty, its color is of a light yellow, and its taste is much more pungent and aromatic than that of the black kind. (Hunt's Merchants' Magazine.)

HENS EATING THEIR EGGS.

PEN your fowls up for fattening as soon as you please, after they have once commenced eating their eggs. There is no cure for them. We speak from experience, says the editor of the *Boston and South Guardian*. Two years ago our entire ornithological establishment, consisting of a dozen Dorkings, was condemned in like manner. We fear that we had taught the fowls habits of cannibalism by giving them the shells of their own eggs to eat. We tried mild curative measures first. We gave them boiled eggs, scalding hot, and after a first taste they cooled their bills in the gravel, turned the egg over and over a few times with their feet, and then, when it was ready for eating, fought and scratched over the dainty morsel, and swallowed it before our eyes. The cockerel, who, as the father of a family ought to have known better, and set a good example, strutted about as if he highly approved the transaction, and occasionally selected a dainty morsel of the yolk for himself, thus becoming worse than an accomplice in the infanticide. After this we adopted another expedient. We got an egg blown, and filled the shell with a composition of mustard, vinegar, aloes, salts and other horrible associations. The fowls got one good dose, and ran up and down the walk, chattering, and shaking their heads, with an expression of intense disgust which was very ludicrous to witness. Like Mr. Samuel Weller at the Harrowgate Spa, they only tasted the liquor *once*; but the punishment was useless, as we got no more eggs.

PERPETUAL MOTION.

THE *Journal of Commerce* says, that Mr. James G. Hendrickson, of Freehold, Monmouth County, New-Jersey, after 40 years of patient "whittling," has made a machine that will not only "go of itself," but will compel divers other bodies, to which it is attached, to go likewise; in short it has power! The success is in the direction in which so many have long labored in vain, viz., by the use of arms and balls attached to a cylinder so as to keep the extra weight always on one side, and therefore to give the cylinder a constant inclination to turn round. The machine requires no starting; take away the blocks, and it goes off, "like a thing of life." The model was in our office yesterday, and attached to some clock work, which it turned without stopping to breathe. We see no reason why it would not go until worn out. Whether on a larger scale the principle would be available, we are not prepared to say; it would be rather awkward to manage at first, as the power could not be turned off, and it would have to be managed like a skittish horse, i. e. either "hitched" or held by the bridle. If it should "take to going fast," we think the centrifugal force acquired by the balls would prevent their rolling back to the center; but of this we can judge better when it is put to its speed. Mr. Hendrickson will take some steps to remunerate himself for his years of trial, and it is probable will before long exhibit his model at some place in the city, where the curious may satisfy themselves of its merits. After a careful examination, we can safely say, in all seriousness, that the propelling power is self-contained and self-adjusting, and gives a sufficiently active force to carry ordinary clock work, and all without any winding up or replenishing.

Boys' Corner.

(For the American Agriculturist.)

DISCOURAGING CHILDREN.

I read your short article on "Discouraging children," (vol. 12, p. 344,) with great satisfaction, because the idea there presented for the consideration of parents, guardians, and teachers, is one of very great importance; and, because, also, it is an idea very seldom elucidated by those who write upon the subject of education.

It is quite probable, also, that I was peculiarly pleased with the article alluded to, because there are several persons among my acquaintances, who are living commentaries on its pertinency and truth. Allow me to give you a brief sketch of the experience of a gentleman with whom I have long been intimate:

His father was a man of fine education, but of a very irascible temper, unfortunately. He made it a matter of conscience to attend personally to the literary training of his son, until the boy was fourteen years of age, at which time the father died and left his child very much his own master.

Being a boy who dearly loved to play and who hated intensely anything like confinement within doors, his father's severe system of training induced in him a perfect hatred of books and study; so that he learned to *shirk* his lessons whenever he could, and would steal away to spend his time in rambling about the woods, fishing, sailing, swimming, &c., &c. Being called a dunce, a blockhead, brainless, good-for-nothing, whenever he was summoned to recite his lessons, it was no wonder the boy became fully convinced that all these allegations were quite true, as far as books were concerned. *He lost all ambition*; and when his father died, leaving him a stout, healthy boy of fourteen, strange as it may appear, he did not know how to write a word, could not distinguish a noun from a verb, was ignorant of the multiplication table—in short, all he could do was to read, but he could not do even that well. Now mark the change, and see how a false system of training may blind a father as to the capacity of his own child. That boy of fourteen, as soon as his father died, was put an apprentice to a mechanical business, at which he had to work early and late; and yet by the time he was nineteen years old, he had, unassisted, fully made up all the deficiencies in his English education, and had prepared himself for college, without a teacher, besides earning enough at his trade to pay his expenses while in college! He then entered one of the best colleges in the country, took a high stand as a scholar, especially in the department of mathematics, and graduated in due time with the highest honors of the institution, preëminent in a class of ninety-four members. I have heard him refer with emotion to the sadness he felt on commencement-day when he vainly wished for the presence of his father, who had died nine years before in the full persuasion that his eldest son was a dunce. N. N.

A SLIGHT HIT.—"Well John," said a boss to his apprentice on the day he was one and twenty, "you have got a fool for a master now." "Yes," said John "and have had for these ten years."

PROFITABLE HONEY CROP.—We learn by the Madison *Banner*, that Abner Bair, a farmer of Jefferson County, Indiana, from one hundred stands of bees, since the first of May, has sold sixteen hundred pounds of honey, for which he received two hundred and eighty-one dollars.

IMMENSE STEAMER.—The tonnage of the gigantic screw and paddle steamer now building at Milwall, England, is 22,000 of builders' measurement, and 10,000 tonnage burden; extreme length, 680 feet; extreme breadth, 83 feet; extreme depth, 58 feet; power of engines (screw paddle,) 2,600 horse. The hull will be entirely of iron. From her keel up to six feet above the water line is double, of cellular construction. The upper deck will also be strengthened, on the same principle, and will form a complete beam, so that any external injury will not affect the tightness or the safety of the ship. She is divided into ten separate water-tight departments, each being sixty feet in length, enabling her to take out sufficient fuel for a voyage to Australia and back to England without stopping.

The Dahlia is a native of the marshes of Peru, and was named after Dahl, the famous Swedish Botanist. It is not more than thirty years since its introduction into Europe.

(Prairie Farmer.)

Markets.

REMARKS.—Flour has fluctuated about 25 cents per barrel the past week, but closes a little firmer than per our last. Wheat, owing to the small quantity in market, is higher. Corn and other grain, no change. Pork and Lard have given way some. Beef remains unchanged. Wool is dull again, and likely to remain so till the demand for woollen fabrics increases.

Southern products, no change worth quoting.

The weather was rainy two days last week, and then it cleared off fine and warm. Grass and turnips are still growing quite rapidly around us.

PRODUCE MARKET.

SATURDAY, October 7, 1854.

The prices given in our reports from week to week, are the average wholesale prices obtained by producers, and not those at which produce is sold from the market. The variations in prices refer chiefly to the quality of the articles.

The market is pretty fair this morning, though not quite as brisk as last week. Potatoes are gradually on the decline, and the prospect is that the market will continue to be well supplied. Other kinds of vegetables vary but little. Tomatoes are nearly out of season, and hardly worth quoting.

The supply of apples is good, and undoubtedly will be throughout the fall and winter. Virgaloo pears are selling from \$5 to \$12 per bbl. according to quality. Grapes have been selling the past week in large quantities and at good prices. Butter, eggs and cheese, remain nearly the same as last week.

VEGETABLES.—Potatoes, Mercers, \$2 75@3 25 per bbl.; White, \$2 50@3; Sweet, Philadelphia, \$3 50; Virginia, \$3 25; Beets, \$3@3 50 per hundred bunches; Carrots, \$3@3 25; Parsnips, \$3 50; Marrow Squashes, \$2 per bbl.; Cabbages, \$4@6 50 per hundred; Pumpkins, \$4@8 per hundred; Citron Melons, \$1@2 per bbl.

FRUIT.—Apples, \$2 25@2 37 per bbl.; Pears, cooking, \$4; eating \$5@12; Grapes, Isabella, 6c.@11c. per lb.; Catawba, 8c.@11c.; Cranberries, \$6@7 per bbl. Butter, State 21c.@23c. per lb.; Western, 17c.@18c.; Eggs, 19c.@20c. per doz.; Cheese, 10c.@11c. per lb.

NEW-YORK CATTLE MARKET.

Monday, Oct. 9, 1854.

WE have rarely seen the Cattle Market so dull as it is to-day. The butchers laid down their own prices, to which the brokers mostly had to submit. Indeed we heard some of them talk about giving away their cattle. This dullness in the market may be attributed, in part, to the change in the weather, which to-day is quite warm, and in part to the large supply of pork. The number of cattle is not very large, nor are they, on the whole, of inferior quality. Some of them are about equal to any we have seen. Among others, we may particularize a drove

of 70 from Chester county, Pa., belonging to Mr. Eli Pyle. They were well fattened, and were surpassed by none in the yards.

Messrs. Wheaton & Purchase also had an excellent drove, 114 in number. These, too, were from Chester county, and are quite creditable to the State. We might mention the cattle of Mr. Joseph Williams. He had in market three droves, about 75 in each, two of them from the same place, and one from Virginia—the latter, however, inferior to the others.

Good beeves are selling from 8c.@9½c. per lb. A few, perhaps, for 10c., though this is the top of the market. Inferior quality, 7c.@8c. There will, undoubtedly, be a good many cattle left over.

There is a further decline in the sheep market, as noticed by our last.

The following are about the highest and lowest prices:

Beeves.....	7½c.@10c.
Cows and Calves.....	\$30@50.
Veals.....	4c.@6½c.
Sheep.....	\$2@7.
Lambs.....	\$2@4 50.
Swine, corn fed.....	4½c.@4¾c.
" still fed.....	4c.@4½c.

Mr. Chamberlain reports beeves, 7½c.@10½c.; cows and calves, \$20@50; veals, 4½c.@7c.; sheep, \$2 50@6; lambs \$1 75@4.

Mr. Browning reports beeves, 6½c.@9½c.; cows and calves, \$25@55; veals, 3½c.@5½c.; sheep, \$2@6; lambs \$1 75@4.

Mr. O'Brien reports beeves, 6c.@8½c.; cows and calves, \$20@40.

Washington Yards, Forty-fourth-street.

A. M. ALLERTON, Proprietor.

RECEIVED DURING THE WEEK.	IN MARKET TO-DAY.
Beeves,.....	2796
Cows,.....	18
Calves,.....	319
Sheep and lambs,.....	1432
Swine,.....	1669

Of these there came by the Hudson River R. R., 380; Hudson River boats, 232; Erie R. R., 618, also 1,310 swine; Harlem R. R., 404.

New-York State furnished, by cars, 400, on foot, 66; Ohio, 568; Kentucky, 206; Illinois, 304; Pennsylvania, 818, on foot; Virginia, 71, on foot; Connecticut, 99, on foot.

RECEIVED DURING THE WEEK.

	CHAMBERLIN'S.	BROWNING'S.	O'BRIEN'S.

Cows and calves,...	184	40	126
Veals,.....	145	100	54
Sheep and lambs,...	8,364	6,441	—

The following are the sales of sheep and lambs by Samuel McGraw, sheep broker, at Browning's: 21 sheep and lambs, \$55; 107 lambs and sheep, \$533; 16 lambs and sheep, \$60; 81 sheep, \$175 55; 51 lambs and sheep, \$168 75; 12 sheep, \$37 15; 119 sheep and lambs, \$375 37; 119 lambs and sheep, \$398; 40 lambs, \$132 62; 173 sheep and lambs, \$490 25; 116 lambs and sheep, \$315; 114 lambs and sheep, \$427 50.

The following are the sales by James McCarty, also sheep-broker at Browning's: 99 sheep and lambs, \$287 49; 273, \$943 12; 75, \$234 37; 46, \$66 25; 102, \$395 25; 293, 115, \$304; 172, \$406 25; 77, \$198 75; 100, \$278 25; 117, \$288 75; 89, \$234 25; 50, \$181 25; 124, \$371. Total sheep and lambs, 1,535.

Sales of Sheep and Lambs at Chamberlin's, by John Mortimore:

Sheep.	Price per head.	Price per lb. for mutton.
100	\$3 25	8½ cts.
87	3 12½	8½
233	3 62½	9
100	4 08	9
95	3 20	8½
203	2 25	8
100	2 75	8
185	3 50	8½
180	2 62½	8
107	4 00	9
140	4 25	8½
80	2 50	8½
100	3 12½	8½
125	2 62½	8½
47	3 50	8½
Lambs.		Price per lb. for meat.
213	2 12½	10
166	3 12½	10½
125	3 37½	11
97	3 12½	10½

The dullness occasioned by the warm weather noticed in our last, has continued throughout the week, but fair prices were obtained considering the abundant supply offered, but the surplus is not large and the market closes with a fair prospect, though little improvement can be expected until cooler weather sets in.

Common sheep sold at \$2@4; extra sheep at \$4 50@7; lambs sold at \$1 75@4; store ewes at \$2 25@3 25, the latter are in demand. Mutton is selling in Washington Market at 4c.@8½c.; lambs at 7c.@12½c., as in quality.

1,000 ORNAMENTAL TREES—Suitable for Belts, Masses, Shrubberies, Woods, &c., in the best and hardiest varieties, strong and well grown—delivered in Boston and New-York. Price list on application.
B. M. WATSON,
Old Colony Nurseries, Plymouth, Mass.

WACHUSETT GARDEN AND NURSERY, New-Bedford, Mass. ANTHONY & McFEE, Proprietors, successors to Henry H. Crapo, would invite the attention of the public to their extensive stock of Fruit and Ornamental Trees, Flowering Shrubs, Rose Bushes, &c., Evergreens, Balsam Firs, American and Chinese Arbor Vite, Cedrus Decidua, Cryptomeria Japonica, Norway Spruce, Yew Trees, Tree Box, &c., &c.
An extensive assortment of Apple, Pear, Plum, Cherry, Peach, and Apricot Trees.

The stock of Pear Trees is very large, both on Pear and Port-nal Quince Stocks, embracing every thing worthy of cultivation. All our Pear Trees are propagated and grown by ourselves, and

WARRANTED TRUE TO NAME.
The soil, climate, &c., of this locality being so favorable to the Pear, our Trees are unrivaled for HEALTH, vigor of growth, &c., &c.
They are all free from that destructive malady, **THE PEAR BLIGHT**, which has never existed in this locality.
Prices low, and a liberal discount to the trade.
New-Bedford, 1854. 17-68

Carriage paid to New-York. Ornamental and other planting done in any part of the country. The best season for transplanting is after October 10. Address
B. M. WATSON,
56-61 Old Colony Nurseries, Plymouth, Mass.

SUPREME COURT.—In the matter of the Staking of lands for a new Reservoir, between Eighty-sixth and Ninety-sixth-streets, and the Fifth and Seventh-avenues in the City of New-York.

To all owners, mortgagees, lessees, occupants, and other persons, in any matter, by judgment, decree or otherwise, entitled unto, or interested in the lands or premises above mentioned, or any part thereof.

Notice is hereby given that you are required to appear before the Commissioners of Appraisal in the above entitled proceeding, at the office, No. 293 Broadway, the third story front room, at 10 o'clock, A. M., on any day (Sundays excepted) on or prior to the 21st day of October next, and to produce the evidences to your title or interest therein. In default thereof, and in case the person entitled or interested as aforesaid shall not be ascertained by or be known to the said Commissioners, or be fully known, the same will be reported to the Supreme Court as belonging to unknown owners.

It being the desire to consummate this great improvement, and to present the report at the earliest day consistent with proper examination, and due regard to rights and interests affected, it is earnestly requested that all parties note and comply with the preceding notice, as no other or further notice will be issued.

Dated New-York, September 1, 1854.
EDWARD C. WEST,
ABRAHAM TURNURE, } Commissioners.
DANIEL DODGE,
ROBERT J. DILLON, Counsel to the Corporation.

N. B.—All papers published in the City of New-York are requested to publish the preceding notice until the 21st day of October next, once in each week, and to send their bills, with affidavits of publication, to the office of the Counsel to the Corporation, to be paid on the final taxation of the proceedings. 57

STATE OF NEW-YORK—Secretary's Office, Albany, August 10, 1854.—To the Sheriff of the County of New-York: Notice is hereby given that at the GENERAL ELECTION to be held in this State on the TUESDAY succeeding the first Monday of November next, the following OFFICERS are TO BE ELECTED, to wit:

A Governor, in the place of Horatio Seymour;
A Lieutenant-Governor, in the place of Sanford E. Church;
A Canal Commissioner, in the place of Henry Fitzhugh; and
An Inspector of State Prisons, in the place of Henry Storms;
All of whose terms of office will expire on the last day of December next.

A Representative in the Thirty-fourth Congress of the United States, for the Third Congressional District, composed of the 1st, 11th, 12th, 13th, 14th and 15th Wards in the City of New-York; for the Fourth District, composed of the 16th, 17th, 18th, 19th and 20th Wards of the City of New-York; for the Fifth District, composed of the 21st and 22nd Wards in New-York, and the City of Williamsburg, in Kings County; for the Sixth District, composed of the 23rd, 24th and 25th Wards in the New-York; for the Seventh District, composed of the 26th, 27th and 28th Wards in New-York, and for the Eighth District, composed of the 29th, 30th and 31st Wards in New-York.

County Officers also to be selected for said County: Sixteen Members of Assembly.

A Surrogate, in the place of Alexander W. Bradford;
A Recorder, in the place of Francis R. Tillou;
A City Judge, in the place of Welcome R. Beebe;
A Mayor, in the place of Jacob A. Westervelt;
A Register, in the place of Garrett Dyckman;
A Commissioner of Streets and Lamps, in the place of George G. Glazier, who was appointed to fill a vacancy caused by the resignation of Henry Arcularius;
A Police Justice for the Second District, in the place of Daniel W. Clark, who was appointed to fill a vacancy caused by the death of John McGrath;

Two Governors of the Alms House, in place of Gustavus A. Conover and William Pinckney, appointed to fill vacancies;

A District Attorney, in the place of Lorenzo B. Shepard, who was appointed to fill a vacancy caused by the death of Nathaniel B. Blunt.

A Civil Justice and a Police Justice for the Seventh Judicial District, composed of the 11th, 12th, 13th, and 14th Wards;

A Police Justice for the Eighth Judicial District, composed of the 15th and 16th Wards. Yours respectfully,
E. W. LEAVENWORTH, Secretary of State.

SHERIFF'S OFFICE, New-York, Aug. 14, 1854.
The above is published pursuant to the notice of the Secretary of State and the requirements of the statute in such case made and provided.

JOHN ORSER, Sheriff of the City and County of New-York.
All the public newspapers in the County will publish the above once in each week until the Election, and then hand in their bills for advertising the same, so that they may be laid before the Board of Supervisors and passed for payment. See Revised Statutes, volume 1, chapter 6, title 3, article 3, part 1, page 140. [33-50] JOHN ORSER, Sheriff.

PERUVIAN GUANO.—First quality of Fresh Peruvian Guano, just received in store.
R. L. ALLEN, 189 and 191 Water-st.

WILLARD FELT, No. 191 Pearl-street, (near Maiden-lane,) Manufacturer of Blank Books, and Importer and Dealer in PAPER and STATIONERY of every description. Particular attention paid to orders. 26-77

MACHINE WORKS.—M. & J. H. BUCK & CO.'S Machine Works, Lebanon, N. H., Manufacturers of a great variety of wood working Machinery, of the most approved style, simple construction, and effective and firm operation, to be found in the country; comprising complete sets for making Railroad cars, doos, sash and blind, ship-building, bedsteads, cabinet, and carpenter work, &c. &c. Also, some machines of peculiar merit, such as for single and double Tenoning, capable of making from one to four lengths at the same operation of any width, size, or length, on large or small timber, with revolving cylinder attached. Also, an improved timber Planing Machine, with the addition of a side-cutter, with which the top and edge of timber or plank is planed, whether square or bevel, at the same operation, and in the same time occupied in planing but one side on all other machines. They also manufacture circular, single, and gang Saw Mills, Flouring and Corn Mills, hand and power Hoisting Machines for storehouses, Shafting, Hangers, Pulleys, and Mill Gearing of all patterns.

MARTIN BUCK,
J. H. BUCK,
F. A. CUSHMAN,
WM. DUNCAN,
AGENTS—R. L. Allen, 189 and 191 Water-st.; S. B. Schenck, 168 Greenwich-st.; Andrews & Jessup, 67 Pine-st.; Lawrence Machine Shop, 51 Broad-st., New-York, and Lawrence, Mass.; Leonard & Wilson, 60 Beaver-st., and Wm. F. Sumner, Crystal Palace. 36-1f

FERTILIZERS.—Bone Dust

Agricultural Implements.

WALK NURSERY, a fine stock of the New-Rochelle (or

Lawton) Blackberry Plants, at \$6 per dozen; also the White-

fruted variety at \$3 per dozen; also the new pure Red Ant-

werp Raspberry. GEO. SEYMOUR & CO.,

51-76 South Norwalk, Conn.

SUPERIOR SEED WHEAT.—A LARGE

assortment of the best varieties of improved Seed Wheat;

among which are the Red Mediterranean, White Mediterranean,

Soule's and Blue stem. For sale by

R. L. ALLEN, 189 and 191 Water-st.

FANCY FOWLS FOR SALE.—A variety

of pure bred Fowls, Asiatic, Spanish and Game Fowls, Sc-

bright, Black African, Antwerp, and other Bantams.

B. & C. S. HAINES,

Elizabethtown, New-Jersey.

THE HORSE, THE HORSE, THE HORSE,

NOBLEST OF DOMESTIC ANIMALS, And the one most frequently ill-treated, neglected, and abused. We have just published a Book so valuable to every man who owns a horse, that no one should willingly be without it. It is entitled,

THE MODERN HORSE DOCTOR. and is from the pen of that celebrated English Veterinary Surgeon, Dr. GEO. DADD, well known for many years in this country, as one of the most successful scientific and popular writers and lecturers in this branch of Medical and Surgical science. The Book which he now offers to the public is the result of many years' study and practical experience which few have had.

From the numerous and strong commendations, of distinguished men and the newspaper press, we select the following:

Extract from a letter from Hon. John H. Clifford, Ex-Governor of Massachusetts:

NEW-BEDFORD, May 11, 1851.
DR. DADD—Dear Sir: I hope your new work on the noblest creature that man has ever been permitted to hold in subjection—the Horse—will meet with that success which all your efforts in this direction so well deserve.

Your obedient servant,
JOHN H. CLIFFORD.

From Hon. Marshall P. Wilder.

BOSTON, May 13, 1851.
DR. DADD—My Dear Sir: I am greatly obliged to you for the valuable treatise, the results of your own investigations, which you have recently issued, hoping that it may meet with the patronage of a discriminating community.

I remain yours with great regard,
MARSHALL P. WILDER.

The "Modern Horse Doctor," by Dr. G. H. Dadd, is a manual of genuine science, and ought to be owned and studied on the score of humanity, as well as interest, by every man who owns a horse.

[Boston Congregationalist.

Dr. Dadd has had great experience in the cure of sick horses, and explains the secret of his success in this volume.

[New York Tribune.

The author of this work is well known as a most skillful veterinary surgeon; and no owner of that noblest of the animal race, the horse, should be without it. Especially should it be in the hands of every hotel and livery-stable keeper. To many a man would it be worth hundreds of dollars every year.

[Ind. Democrat, Concord.

By far the most learned and copious work on the horse and his diseases we have ever seen.

[N. Y. Evangelist.

One of the greatest and most commendable qualities of this work is, it is practical and plain to the comprehension of those farmers and others for whom it is mainly designed. The course of treatment favors generally a more salutary and rational system of medication, than that recommended in any previously existing works on farriery. No farmer or owner of a horse should be without this book. Stable-keepers, stage-proprietors and hackmen we believe would derive profit by having at least one copy hung up in their stables for use and reference by their stable men.

[Daily News, Philadelphia.

There is more common sense in this book than any of the kind we have ever seen, and farmers and owners of horses would find it a matter of economy to possess themselves of it. It will be of more service than the counsel of a score of ordinary doctors.

[Albany Courier.

We deem this decidedly the best and most reliable work on the "Cause, Nature, and treatment of Disease and Lameness in Horses," ever published.

[Nantucket Inquirer.

What we have read of this book induces us to regard it as a very sensible and valuable work; and we learn that those much more competent to judge of its value, have given it their unqualified approval.

[Eve. Traveler, Boston.

This book supplies a great desideratum which Skinner's admirable treatise on the horse did not fill. Every man may be his own veterinary surgeon, and with much greater safety to this noble animal, than by trusting him to the treatment of the empirical itinerants who infest the country. It is well illustrated, and should be purchased by every man who owns a horse.

[Eve. Mirror, New-York.

This is a book that should be forthwith put into the hands of all who own or drive horses, whether for the dray or gig, for the plow, omnibus or road, for hard service or pleasure.

[McMakin's Courier, Phila.

A good, clearly-written book, which should be in the hands of every man who has a horse whose ill his affection or his purse make it worth while to cure.

[Bangor Mercury.

It is a valuable book to those who have the care of horses.

[Hartford Herald.

This is a scientific, thorough and complete treatise upon the diseases of which the noblest of animals is subject, and the remedies with they severally require.

[Troy Budget.

He is not worthy to have a horse in his care who will not use such a work to qualify himself for his duty to his animal.

[Commonwealth, Boston.

HORSE POWERS THRESHERS AND

SEPARATORS.—The Endless Chain or Railway Powers of our own Manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, durability, and economy. They are universally approved wherever they have been tried.

2. The Bogardus Power, for one to four horses. These are compact and wholly of iron, and adapted to all kinds of work.

3. Eddy's Circular Wrought-iron large Cog Wheels, for one to six horses. A new and favorite power.

4. Trimble's Iron-sweep Power, for one to four horses.

Threshers.—Improved Threshers upon the best principles, threshing clean with great rapidity, without breaking the grain.

One-Horse, Undershot \$25

Two-Horse, do. \$30 to \$35

One-Horse, Overshot \$28

Two-Horse, do. \$33 to \$38

Separator, which greatly facilitates cleaning the grain and preparing it for the fanning-mill . . . \$7 to \$10

All the above-named machines are guaranteed the best in the United States.

R. L. ALLEN, 189 and 191 Water-st.

TREES AND PLANTS.—PARSONS &

CO., Flushing, near New-York, offer for sale their usual

assortment, with the addition of many rare novelties of Fruit

Trees, for the Orchard and the Garden; Ornamental Trees,

Shrubs, and Roses, for the Avenue, Lawn, or Cemetery. Vines

for the Grapery, and Exotic Plants for Greenhouse culture.

Catalogues can be obtained at No. 60 Cedar-st. will be sent

by mail to all post-paying applicants inclosing a postage

stamp.

FOR PROSPECTUS, TERMS, &c.,
SEE LAST PAGE.

FIRST ANNUAL SHOW OF THE CONNECTICUT STATE AGRICULTURAL SOCIETY.

It is with no small degree of pleasure that we record the above show as eminently successful. The State Society was organized less than two years since, and till the opening of the Exhibition at New-Haven, on the 10th inst., there were comparatively few names enrolled as members. There are but eight counties in the State, and in two or three of these, agricultural societies have only recently been formed. As far as our observations have extended, there has been a general apathy in most parts of the State in regard to the value and importance of a State agricultural gathering. The different railroads were so little awake to the matter and especially to their own true interests, that, till a very late day, none of them offered any facilities in the free transportation of stock and articles of exhibition or in reduced rates of passenger fare.

But, notwithstanding these and other discouraging circumstances, a few of the more active members set themselves vigorously at work to get up, if possible, a show which should place Connecticut at once upon a par with other States. Without disparaging the efforts of others who lent a willing hand to the enterprise, we think it but just to say, that very much of the success attained should be accredited to the Executive Committee, Judge Huntington, of Hartford County, and Messres. Henry, A. Dyer, of Windham County; and T. S. Gold, of Litchfield County. Those who have not "been through the mill," know little of the immense amount of labor involved in getting together the varied productions of a State, in preparing a suitable place of exhibition, including its inclosure, buildings, tents, seats, attendants, &c., and in making up a judicious list of premiums with competent committees of awards, &c., &c. The few who got up and managed the enterprise in this instance, have made their mark, and need no aid from our pen to heighten the admiration with which their labors are regarded by their fellow farmers.

THE SHOW GROUNDS, inclosing fifteen acres, were admirably adapted for the purpose, being located upon the level, sandy plain, a mile and a half west of the State house.

With regard to the arrangement of the buildings, tents, stalls, &c., we might say, as we said last week of the New-York exhibition, this was a *model* to be imitated. Th-

stalls for horses, pens for sheep and swine, and coops for fowls were arranged around the outside. Within this circle, and parallel to it, were placed the covered cattle pens, open on both sides, so that the animals could be viewed both from front and rear. This is an important consideration, and should always be kept in view. Within this last circle was laid one of the best tracks for trying the speed and training horses that we have ever seen upon any show ground. Inside of this track were the buildings for mechanical productions, and refreshments, and several tents, including one for horticultural and one for vegetable products, one for agricultural implements, one for carriages, one for meetings of committees, and one for the President of the the Society. A part of the space inclosed with a rope, was devoted to exhibiting the various animals in successive groups or classes.

The number of entries amounted, in the aggregate, to 1440. Many of these included several distinct specimens, and we think the entire number of articles would amount to 5,000, or more.

The weather throughout was propitious, and the attendance very large. On Thursday there were not less than 23,000 to 25,000 persons within the inclosure, at one time. The receipts amounted to little short of \$7,000. This, added to the \$2,500 appropriated by the State, and a like amount subscribed by the citizens of New-Haven, gives the Society a fund of about \$12,000, which will suffice to pay the premiums and all expenses, and leave a handsome sum as a foundation for future operations.

We must not omit to notice the perfect order and decorum which every where prevailed during the entire four days. Had we not lived in Connecticut before the operation of the MAINE LAW, we should not dream that this State had not always deserved the cognomen of the "land of steady habits." Certainly, on this occasion, the thousands congregated presented an array of cool-headed, intelligent and refined men and women, such as we have not before looked upon. They came together for a great agricultural holiday, and not for one of carousal and dissipation. These remarks apply equally to those within the grounds and to the outsiders. May the farmers of Connecticut long enjoy an annual recurrence of such an exhibition. The good influence thus exerted upon the agricultural interests of the State will be incalculable.

We have not space for a minute report,

but will add a few items from the copious notes collected during the four days we were present. For Horticultural report, see that department, page 86.

CATTLE.

We were somewhat surprised at the large display of cattle, though we should not like to say, as almost every visitor to both Shows whom we conversed with did say, that the collection, taken as a whole, far excelled that of New-York the week preceding. The number of good Devons was quite beyond our expectations, and in working cattle the Connecticut Show was certainly superior. We think the working cattle would be hard to beat any where in this Country, or out of it. We went expecting to see Fairfield County ahead in this department, but Middlesex bore away the palm without a word of contest. The town of Portland, on the east side of the Connecticut river, in that County, (and the location of the far-famed free-stone quarries,) contributed 21 pairs of magnificent oxen. Joseph Hall, of that town, exhibited a pair weighing 5,100 lbs., and all the others were of such proportions that any one of them would raise a commotion if placed among the 3,000 animals that weekly appear in the cattle-yards of this city. These 21 pairs appeared upon the ground in a train, drawing a large cart, which bore aloft a U. S. flag, and a large pennant inscribed "PORTLAND," and was loaded to overflowing with a delegation of Portland MEN. A very interesting part of the Show exercises, was a trial of strength by each of some 20 or more pairs of working oxen. The Portland exhibitors were, the Middlesex, Shailer & Hall, and Brainard Quarry Companies; Daniel Russel, M.^r. F. Pelton, Joseph Hall, Nelson Hall, Edward Shepard, Samuel Wilcox, Joseph Hall, Henry S. Cadwell, and R. Goodrich.

Among the other exhibitors of the different classes and varieties of cattle, we noticed Messrs. Townsend, of East Haven; R. Battell, of Norfolk; Wm. A. Clark, of Woodbridge; Lester Luce, of Newington; Horace Hart, of New-Britain; Thomas Cowles and Frederick Deming, of Farmington; Silas C. Judson and Nathaniel B. Smith, of Woodbury; Dr. Gold, of Cornwall; Mr. Birdsey, of Meriden; and E. B. Bishop, of New-Haven.

HORSES AND MULES.

The exhibition of Horses was perhaps one of the best that has been connected with an Agricultural Show in this country. Every department of fast, heavy, carriage, and team

horses, breeding mares, stallions, and colts were well represented. The "trotters" were in the ascendant, and attracted thousands of persons to the ground who would have come for nothing else. The sports of the race-course were fully participated in without its usual objectionable accompaniments.

To give a full and just account of this department would require more space than we can devote to our entire report.

MULES.—The only specimens of this important class of animals noticed by us, were two beautiful and admirably trained spans, which are owned by Mr. E. B. Bishop, of New-Haven. As they were driven together before a carriage, they exhibited almost as much gracefulness of motion and perfection of training as the best spans of horses.

SHEEP.

The show of Sheep was quite limited. They were chiefly from Litchfield County. Mr. J. T. Andrews, of West Cornwall had some fine animals, including his New-Oxfordshire yearling buck, weighing 204 lbs., which took the first premium at the recent New-York Show, and an imported ewe, which took a discretionary premium at the same place.

Mr. T. L. Hart, of Cornwall, showed a noble long-wooled buck and several fine ewes and lambs. Two of the latter—twins—are very good, being now as large as the common full-grown sheep. We also noticed five excellent specimens of New-Oxfordshire lambs, exhibited by Mr. Hitchcock, of Washington; Saxons, grades, and natives, by Dr. Gold, of Cornwall; and Silesian bucks and ewes, by Mr. Geo. Campbell, of West Westminster, Vt.

SWINE.

There was comparatively a small show of these, and we made few notes worthy of record. Those showing the best animals were P. T. Barnum, of Bridgeport, imported Suffolks; Josiah P. Isbell, of Bridgeport, one fine native sow, and another with 12 pigs; Mr. Gates, of Hartford, a superior Suffolk boar; H. Olmstead, of East Hartford, Suffolk sow and pigs; C. E. Chapman, of the same town, a fine native sow and pigs.

POULTRY.

The show of the feathered tribe was creditable in the highest degree. Shanghais of every hue, Black Spanish, Bolton greys, games, Bantams, frizzles, turkeys, geese, doves of several varieties, &c., &c., joined in one chorus their harmonious and unharmonious notes. Among the exhibitors we noticed P. T. Barnum, Bridgeport; J. G. North, of New-Haven; Wm. L. Wilson, of New-Britain; J. C. Albrow, of Stonington; Winfield Cox, of West Meriden; Geo. E. Maltby, of Fair Haven; R. R. Bunnell, of Seymour; Mr. Richards and N. Beers, of New-Haven; and E. Bassett, of Hamden, who showed a very fine collection.

PLOWING MATCH.

This took place on Thursday, and was one of the best things of the Show. There were 20 competitors, including one subsoil and two Michigan or double plows. Nearly all did

the work admirably, and in considerably less than the allotted time—one hour to the eighth of an acre. The three highest prizes were taken by Julius A. Gorham, of Hamden; T. L. Hart, of West Cornwall; and A. & T. Jerome, of Bloomfield. The subsoil plowing was a timely introduction, and we trust it will hereafter be assigned a more prominent place in all plowing matches. We would add the same remark in regard to the Michigan plow. Many farmers who here saw these in operation for the first time, will go home and commence their use upon their farms.

At New-Haven, as at all former State and County Shows, too little encouragement is given to good plowing. We think the highest premium should be \$50, instead of \$15.

We suggest that next Summer there be held a National Plowing Match, open to all plows and plowers in the Union. Which of the Springfields or other towns will set the ball in motion?

FARM IMPLEMENTS.

The show of these was a tolerably good one. Improved implements of husbandry are among the most important things connected with agriculture. Through many parts of the "Yankee Notion" State, we have noticed a sad deficiency in this department. Among the principal exhibitors were Munson and Johnson, of New-Haven, R. L. Allen, of New-York, Ruggles, Nourse, and Mason, of Boston, and Horace Emery, of Albany.

DAIRY PRODUCE, GRAIN, VEGETABLES, &c.

This department was pretty well filled. We have not room now for an enumeration.

DOMESTIC AND OTHER MANUFACTURE.

Two large buildings were literally crammed with these. We must pass them over, however, with a brief notice of two articles, which are new and specially interesting. One of these is a combined center and work table, and Melodeon. The general appearance is that of a rosewood center or card table, about four feet square, with the corners slightly rounded, the top part being five or six inches in thickness. This is supported upon a center standard with four branching foot supports. Two small pedals project from one side. On turning up one side of the cover, the key-board of the Melodeon is presented, the bellows and reeds being within the table, and on the opposite side, you open a case containing the necessary compartments of a lady's work-box or work-stand. This was exhibited by the inventor and manufacturer, Mr. W. P. Gardner, of New-Haven.

The other article alluded to, is Plimpton's combined Secretary, Bedstead and Toilet Table—it is essentially all of these. As you look at it, it appears like nothing but a fine Secretary, with writing desk, drawers, &c. In thirty seconds it can be changed to a good style bedstead, with bed all arranged and made, and a separate toilet stand, with all conveniences for washing, shaving, boot blacking, &c., &c. This was exhibited by H. R. & J. L. Plimpton, of Westfield, Mass.

CARRIAGES.

We expected to see, in New-Haven, such a display of vehicles on wheels, as could be produced in no other place in the country; but this department was almost a complete failure. The cause of this we did not learn.

CLOSING EXERCISES.

These consisted of a short speech from Gov. Hoppin, of Rhode Island, who chanced to be present, of which we will give a report hereafter, and the annual address by Governor Dutton, of Connecticut, which is to be published in full by the Society.

FAYETTE, KY., AG. SOCIETY SHOW.—The *Louisville Journal* says: It will be seen by the list of awards, Mr. Robert A. Alexander, of Woodford, was the most successful contestant of all the exhibitors. His imported herds are the largest, and comprise, without doubt, the finest stock in the United States. Possessed of an estate in Scotland that yields him an annual revenue of \$80,000, he is devoting his time and means to a great extent to the improvement of the different breeds of cattle. Upon his native homestead, in Woodford, he has recently erected stone stables, at a cost of \$18,000. Among the handsomest improvements on the fair grounds are the stabling accommodations he has had built for his stock.

For the American Agriculturist.

FARMERS' LYCEUM IN GREENE TOWNSHIP.

MESSEURS. EDITORS: Having recently enjoyed the pleasure of attending a meeting of the "Greene Township Farmers' Lyceum," I place at your disposal a few lines respecting it. The Lyceum numbers as its members about a dozen enterprising farmers, most of whom reside in the vicinity of Cheviot, six miles from this city. They meet monthly, usually accompanied by their families, at the house of some one of the members, and after enjoying an hour or two in social intercourse and partaking of an excellent dinner—such as is seldom met with except at farmers' houses where, during a large part of the year, most of the edibles are fresh from the garden or field—they spend a few hours in the discussion of some agricultural question, selected at the previous meeting.

The question on this occasion was, "The best modes of making butter and cheese." Several of the ladies participated in the discussion respecting butter making, convincing us that they understood the theory as well as practice of it. One of them gave the process adopted by her neighbor, who, several weeks ago, sold her butter readily in this market for 35 cents per pound, while others sold at 20 cents. An English lady described minutely the mode of making Devonshire cream—which I presume might with propriety be called butter—a luxury on any table. One gentleman insisted on the importance of cool spring-houses, or drains, for keeping milk and butter, believing that if their wives and daughters are furnished with them, they will not fail to be supplied with good butter. He said that if butter, in the making, is left in a soft, warm state, no after-treatment can restore it to the firm condition desirable. But he did not underrate the importance of having cows of good butter-producing qualities, and of proper feed and management.

A mutual improvement being the object of the Lyceum, the members obtain and distribute among themselves seeds from abroad, try experiments, &c., reporting the results at their meetings, which are very pleasant as well as profitable reunions. Among other fruits exhibited on this occasion, was a large green almond, grown in the vicinity.

CINCINNATI, Sept. 10, 1854.

D. D. S.

For the American Agriculturist.

GUANO—NITROGENOUS VS. MINERAL MANURES.

THE failure of guano as a manure to light soils this hot, dry season, is noticed by a Washington correspondent of a New-York paper. 'Tis true that the organic elements in stable manure, encumbered as they are with carbonaceous matter, have a much better effect on the soil in any season, and particularly in a drouth, than the more compact concentrated guano; hence it is that green clover plowed into the soil has a manural value beyond the nitrogen and other salts it contains; not that its woody or carbonaceous matter is at all necessary to supply carbonic acid to the crop, but solely for its mechanical action in the soil, and the water-forming process it aids in, in the process of its decay. Instead, therefore, of denouncing guano as a too stimulating or caustic manure for our hot dry climate, let those farmers who use it adopt the plan of composting it with carbonaceous matter, swamp muck, or even common earthy matter, before it is applied to the soil as manure. It is now generally conceded that guano is chiefly valuable in proportion to the ammonia (organized nitrogen) it contains; hence Peruvian guano, from a rainless climate, is the only kind worth purchasing.

Notwithstanding all Liebig has said of the omnipotence of the ashes of plants, or inorganic manures, I am more and more induced, by experiment, to believe that carbonaceous matter and the compounds of nitrogen without stint, will make any drained soil give the maximum crop; the addition of lime, when its carbonate is deficient in the soil, may be necessary, and its caustic properties may also aid in decomposing the inert vegetable matter in the soil. The reason why river-flats bear larger crops in a drouth than uplands is, that bottom soils, owing to the finely comminuted vegetable and animal matter they contain, hold more water for the use of plants by their more friable mechanical porosity.

No matter how well drained a clay soil may be, or how rich in calcareous matter, nitrogen, or the inorganic elements of plants, it will not bear a good crop of corn in a dry season, unless its compact mechanical structure is ameliorated by that vegetable matter which alone gives porosity to the soil in the process of its decay, forming water in it by the aid of the atmosphere; by such aid a clay soil will never fail to give the largest crop, in the driest seasons known to our climate.

Since the late rains, grass, cabbages, &c., have grown the fastest of the season. So much for the effect of copious rains on a long-dried and oven-heated surface. Say nothing about turnips for an American soil or climate, when you can get Sugar beets or Mangel Wurtzels free from parasite worms, five times the weight to the same calcareous surface; I have them six inches and more in diameter, some of them standing eight inches above ground; how much larger they will grow under the genial influence of the late rains remain's to be seen. N'IMPORTE.

WATERLOO, Sept. 18, 1854.

DOCKING HORSES.

WE are glad to see that the abominable practice of docking and nicking horses is getting out of fashion. It prevails in no other country in the world but England and the United States; we got it from the mother country, and the sooner we leave it off, the better. It is wonderful how anybody but an ignorant narrow-minded block-head of a jockey, should ever have thought of it, being as offensive to good taste as a violation to every humane feeling. Has nature done her work in such a bungling manner, in forming that paragon

of animals, the horse, that he requires to have a large piece of bone chopped off with an ax, to reduce him to symmetry—or that beauty and grace can be obtained only by cutting a pair of its large muscles.

"The docking and nicking of horses," says an intelligent writer on Farriery, "is a cruel practice, and ought to be abandoned by the whole race of mankind. Every human being possessed of a human heart and magnanimous mind, must confess that both the docking and nicking of horses is cruel; but that creature called man attempts thus to mend the work of his Almighty, wise creator—in doing which he often spoils and disfigures them. What is more beautiful than a fine horse, with an elegant long tail and flowing mane, waving in the sports of the wind, and exhibiting itself in a perfect state of nature? Besides, our Creator has given them to the horse for defence as well as beauty."

The same author relates an instance of a fine hunting horse owned by an Englishman, which could carry his rider over a five-barred gate with ease; but he thought the horse *did not carry as good a tail* as he wished—he therefore had him nicked, and when the horse got well, he could scarcely carry him over *two bars*.—"Thus," said he, "I have spoiled a fine horse; and no wonder, for it weakened him in his loins." Any man of common sense would give ten per cent more for a fine horse whose tail had never been mutilated, than for one which had been under the hand of a jockey.

[Woonsocket Patriot.]

FALL AND SPRING TRANSPLANTING.

A correspondent objects to the practice of those, "who still continue in the old delusion, that fall is the best time for transplanting trees"—stating that "some shrubs, and almost all plants, removed in the fall, when the *sap*, the great supporter of their life, has gone into their roots, vegetation ceases in them, and they, consigned to a new, cold soil, perhaps not a single fiber of the roots taking hold until spring, if, indeed, detached almost, if not entirely, from all nourishment, any life remains, are destroyed by fall transportation. Fruit trees, being more hardy, bear up, but they are forever stricken," &c. In the spring, "if the dirt is wet and packed solid around the roots, before they are dug, touching and injuring as few of the fibers and roots as possible, and carefully setting in their new bed, vegetation goes on," &c.

We give this quotation for the sake of pointing out a very common error, namely, that the sap goes down into the roots to winter. Instead of this, the sap usually pervades all parts of a tree alike, and while covered with leaves, these keep up a constant drain or escape. When the leaves fall, although vegetation has ceased, the roots still absorb a small quantity, and as there is no escape through the leaves, the vessels of the tree gradually become filled or distended, so that on the approach of warm weather, stimulating activity, the least wound is followed by a flow of the sap. As soon as the new leaves expand as a general rule, this flow from incisions ceases, in consequence of the drain afforded in another direction.

Now it usually happens that removing the tree in the spring, cuts off in a measure the supply from the roots at the very moment it is most wanted—an evil quite as great as that resulting from any diminished supply in consequence of fall planting. Our correspondent speaks of the evils of "a new, cold soil;"—are we to understand from this that the plant has warmed the bed in which it stood, and that it is chilled, like a human being, by a removal to a fresh bed? Is not the "new soil" as relatively cold in spring as in autumn? He speaks of life being

"destroyed by transportation"—this must refer to long distances; yet the trees may be sent thousands of miles if well packed, with nearly or quite the safety attending their removal to the next farm. Ample experience has proved this to be true. Why are we not allowed to take the same pains in saving the roots and carrying the earth upon them for autumn, as well as spring transplanting?

But throwing theory aside—we have in the course of our practice set out many ten thousands of trees of various sizes, both in autumn and in spring, and we are satisfied that more, by at least twenty-fold, depends on good soil, careful work, and especially on the subsequent culture, than on the season of the year; nevertheless, if it were not for the liability to be thrown out or raised by frost, and the danger to half tender sorts from the cold of winter, we think the advantages would decidedly preponderate in favor of autumn, more especially because it is not accompanied with the check we have already spoken of, at the very moment the trees should commence to grow vigorously. We have never found hardy trees to succeed better, if as well, *other things being the same*, as when carefully dug up in autumn and well laid in till spring, when they are set out, without the above mentioned check.

Shrubs and small plants, if inclining to be tender, are always made more tender the first winter by transplanting; hence they should be either protected, or the work done in spring. Hardy, early starting perennials, as peonies, pie-plant, &c., should always be set out in the fall; while tulips, and many other bulbs, require setting a month or two earlier. The practice must be modified by circumstances, climate, and the habits of the various plants.—*Country Gentleman*.

HOG'S LARD.—It is said that one establishment in Cincinnati, last year, tried out thirty thousand hogs. To carry on this immense business, they have seven large circular tanks of sufficient capacity to hold fifteen thousand gallons each. They receive the entire carcase, with the exception of the hams, and the whole is subjected to steam process, under a pressure of seventy pounds to the square inch, the effect of which operation is to reduce the whole to one consistence, and every bone to powder. The fat is drawn off by cocks, and the residuum, a mere earthy substance, as far as made use of, is taken away for manure. Besides the hogs which reach the factory in entire carcasses, the great mass of heads, ribs, back and bones, tail pieces, feet, and other trimmings of the hogs, cut up at different pork houses, are subjected to the same process, in order to extract every particle of grease. This concern will turn out this season three million six thousand pounds of lard, five-sixths of which is No. 1. Nothing can surpass the purity and beauty of this lard, which is refined as well as made under steam processes. Six hundred hogs per day pass through these tanks one with another.

THE LARGEST HOG.—Martin Roberts, who resides on the river some six miles below Madison, in Kentucky, informs us that he has a hog that weighs upward of nineteen hundred pounds, which he has sold for two hundred dollars. This unexampled hog will be on exhibition at the Indiana State Fair, on the 2d, 3d, 4th, and 5th of October, and will no doubt excite as much curiosity as any other.—*Madison Banner*.

This statement may be true, but we should like to see that hog just to satisfy our curiosity.—ED.

OBSERVATIONS ON IN-AND-IN BREEDING.

Nor having the honor to belong to the veterinary profession, I do not regularly read your very able periodical, though my attention has lately been called by a friend to an article in the number for May last, on the subject of "Animal Physiology, and Breeding Farm Stock," in which the writer most strongly reprobates the practice of in-and-in breeding. It so happens that I am well acquainted with Mr. Barford, of Northamptonshire, who is mentioned by name therein, and having had some opportunities of seeing his management of his sheep, and his practice with regard to in-and-in breeding, I take the liberty of troubling you with a few lines in reply to Mr. Lance's paper.

That gentleman has adduced several instances, or rather related several anecdotes, "as the data on which he founds the argument, that consanguinity in blood among parents leads to degeneracy in the offspring." But, to me, they by no means satisfactorily prove his position. His long quotation from Mr. Lawrence's lectures about the Angola sheep, makes rather for than against the practice of in-and-in breeding, as it clearly recognizes the possibility of retaining varieties of animals by "*preserving the race pure*," by selecting for propagation the animals most conspicuous for size, or any other property we may fix on. In this way we may gain sheep valuable for the fleece, or the earless, large or small, with thick or thin legs; just such, in short, as we choose. The other instances he mentions, as of Hallers, "two noble females," of Mr. Marsh's of Ryton, having produced an "appalling malformation" in the produce of a son with his mother; and others only prove, what I presume Mr. Lanee will at once admit, namely the truth of the old adage, that "like begets like," and that where any imperfections, moral or physical, exist in the parent, they will most likely reappear in the offspring, whether bred in-and-in or not.

As a set-off to one of Mr. Lance's instances, I may mention that Bakewell found that good qualities were also transmissible, and in as great a degree as evil ones. And it is rather singular that he founded the observation in the results of an experiment (amongst others) exactly similar to that of Mr. Marsh, having found that a sow of his never bred so good pigs as when put to her own son. And allow me to ask Mr. Lanee whether "the deformities of mind and body," which, according to Mr. Lawrence, spring up so plentifully in our large cities, cannot be amply accounted for by the intemperate habits, the vicious indulgences, the vitiated atmosphere, the unhealthy occupations, the undrained and unventilated habitations in which so many of our urban population live and have their being, without having recourse to "the want of selections and exclusions" to which he has alluded. For it must be borne in mind that, in the agricultural districts, the same "want of selections and exclusions" exists as in the cities, without, as Mr. Lanee must admit, anything like the amount of mental and bodily deformity, which "degrades the race" in the towns. And, supposing, for the sake of argument, that the state of many of the royal houses in Europe be such as Mr. Lawrence implies, may it not be possible that many generations of luxurious indulgence and unrestrained passions, which, perhaps, are inseparable from their exalted position, may not, by their continued, though gradual effect on the constitution, sufficiently account for it, without attributing it wholly to the fact of their being restricted to some ten or twenty families in the choice of husbands or wives. But to return to sheep-breeding.

I gather, from what Mr. Lanee implies, rather than from what he says, that he

imagines Mr. Barford allows the most promiscuous and indiscriminate intercourse among his flock. There cannot be a greater mistake. The most continual vigilance is exercised to prevent the propagation of any defect, should any appear, and, to use Mr. Lance's own words, "it is only the best that are allowed to continue the race." In this I presume Mr. Barford only follows the example of every other breeder, and not to do so, would at once stamp a man with the most ridiculous imbecility.

If the cousins, of whom Mr. Lance has spoken, of the white breed of fowls in Hampshire, if Mr. Marsh's hogs, if the "silly" sheep in Wiltshire, in fact, if the subjects of any of the in-breeding experiments he mentions, had any "deficiency of nervous energy," and "weakness of nerve or malformation," in short, any defect whatever, it is evident to the narrowest mind, that the nearer the affinities, and the longer they are bred so, the more decided will those defects become. But it must be absurd to attribute them to the bare fact of in-and-in breeding. Mr. Lanee must prove that ALL cross-bred animals are free from ALL defects, before he can say that. In fact, I should regard failure in in-and-in breeding experiments, as the most irrefragable evidence of defect in the parent or parents, and nothing more. I often think that it must be to misapprehension on this point that much of the unmitigated hostility to in-and-in breeding is to be attributed. People, by some means or other, get hold of the idea that the advocates of the system mean universal and indiscriminate in-and-in breeding, than which nothing can be more absurd.

But let us see where Mr. Lanee's favorite system will lead him when carried into practice. As the end and aim of all crossing is of course improvement, all breeders may hope to (may, is the theory be correct, they must, at some period or other), reach a point, beyond which there is no improvement to be made, by crossing; that is, they will produce a perfect animal, or, at least, one more perfect than anybody's else. Now, sir, allow me to propound this question, to Mr. Lanee. When a man has arrived at this point—when he has exhausted every source of improvement which the kingdom, nay, which the world affords—what is he to do? It is evident he must adopt one or the other of the following courses: Either he must feed off and consign to the butcher both his males and females, without any more ado; or he may allow them to live to an unprofitable maturity, and a useless old age, and die at last a natural death; or, he may eal in Mr. Stafford, and disperse to the four quarters of the globe the fruits of perhaps a life-time of care, trouble and anxiety, beside enormous expense, and begin again *de novo*; or, he may knowingly, and with his eyes open, by crossing them with animals inferior to themselves, retrograde, step by step, to the mediocrity and inferiority with which he set out in the first instance; or, his last resource, he may, by in-and-in breeding, attempt to propagate them perfected as they are, and thus retain for his country and himself the benefits which such a race of animals must necessarily confer. But such is the amount of obstinate prejudice now entertained against this system, that we might expect to see many gentlemen, perhaps Mr. Lanee himself, adopt any of the above sources rather than the last. This is a supposititious case, but substantially it may be said to have occurred in the instance of Mr. Barford's flock, as the following rough sketch of its history will show.

About the year 1786, the late Mr. V. Barford commenced sheep-breeding. He hired rams of Mr. Robinson, of Wellingborough, who was a disciple of Bakewell, of Dishley, and bred from his stock. Mr. Barford con-

tinued to do so until about the year 1810, when the present Mr. Barford, considering his own sheep as good as Mr. Robinson's and not being able to find any that he thought calculated to improve them, was really placed in something like the dilemma which I have above mentioned. However, in-and-in breeding had no imaginary terrors for him, and therefore he boldly adopted the last of the courses which I have enumerated; so that, by necessity, even if he had not from choice, he must have become an in-and-in breeder. I will not take upon myself to say that he has succeeded, but I do ask any gentleman who is skeptical of the possibility of the thing to visit him, and inspect a flock of which every individual sheep has a pedigree that can be traced back for upwards of forty years without a cross!

With such a fact as this before me, Mr. Editor, and with the still more significant one that the Jews have bred from the closest affinities from the very time of their father Abraham, without any deficiency of nervous energy, or any physical or moral degeneracy, I think I may be justified in declaring my firm opinion, that the explanation of the numerous and palpable defects in man and animals, in modern times, must be sought in other reasons than the system of breeding Mr. Lanee so strongly objects to.

OMEGA.

COLUMBARY.

THE ALMOND AND SHORT-FACED TUMBLERS.

It is with considerable caution that I approach these peculiar pets of the fancy, for, as most gentlemen have some point in this hobby which they consider paramount, it is impossible to enter into a full description of these beautiful little pigeons in the small compass of this paragraph. I shall, therefore, make a few general remarks on the points, properties, and management of these birds, and recommend those who desire a fuller description, to peruse Mr. J. M. Eaton's "Treatise on the Almond Tumbler."

The Almond Tumblers were obtained by careful breeding, selecting, and crossing colors from the commoner kind of Tumblers, and after a long series of years, by drafting and breeding in-and-in, as much as it was prudent, have they been brought to the state of perfection in which they are now to be seen. I am inclined to think the name of "Almond" originated in their ground-color being formerly that of the well-known almond (nut); though they are now bred of a much brighter color.

The color of the almond Tumbler is a mixture of yellow, red, black and white, well broken and intermixed; but short-faced Tumblers are of various colors and markings, as black, white, yellow, red, kite, and dun, silver or blue, either whole colored, mottled with white, bald-headed, bearded, or magpie.

Their points of excellence may be enumerated under the five following properties of head, beak, eye, shape, and feather:

The head must be round, broad, and high, rising abruptly from the beak; and the fuller and more projecting the forehead, the more it is valued. The beak should be short, small, straight, and tapering, measuring, from the eye to the end of the quick of the beak, from five-eighths to three-quarters of an inch in length—the shorter the better; nor must the nostrils be large, but only slightly developed.

How much better would it be if all pigeon fanciers would adopt this standard of measuring to the end of the quick; then there would be no inducement to pare the Tumbler's beaks, nor yet to coax the bill of the Carrier, or the toe-nail of a Pouter, to an ugly or unnatural development of horn; length or shortness are respectively consid-

ered beauties, but these deformities can hardly be considered such.

The eye should be prominent, round, bright, and of a clear pearl color, without streak or mud-marks, and also free from sore.

In shape, the neck should be short and thin; the head carried rather backwards; the neck slightly bending; the chest full and well thrown out; the back short; the body round, and as small as possible; the flight and tail short; their feet small, and the bird standing on his toes, the ball of the foot often slightly raised from the ground.

Feather is considered the last property; not but that good plumage adds great beauty to the bird, and much enhances the value of an otherwise good specimen. The more an Almond has of bright yellow, and the clearer and more decided the black, so much the more is it admired. Yellow, black, and white are the primary colors, and the more these are intermixed the more they are prized. Blue is considered very objectionable.—Mottled Tumblers are those of any color where the flight and tail are dark and the bodies spotted with white feathers. Of the markings of Baldheads, Beards, and Magpies, I will write more fully in my next, when I speak of flying Tumblers.

In-and-in breeding (that is, coupling relations) is of considerable use in reducing their size and making them fine and delicate; but caution is required not to carry this process too far, or they will become so weak and degenerate, that scarcely any offspring will be raised—and these few worthless. The finer and more delicate they are, the more they are admired; consequently they exist in an artificial state. From their weakness they are rarely allowed to enjoy their liberty, though, on account of their high-breeding and good living, they breed freely, but are very apt to leave their young and go to nest again before the squabs are capable of keeping themselves warm. To prevent these dying, they are shifted to a pair of feeders that have hatched later, so as to secure them more attention and a fresh supply of soft meat (a pap on which the old pigeons feed the young at first). These feeders must, however, be small pigeons with small beaks, or the nurselings may be injured, or have their tender beaks twisted or broken in feeding. (I don't know if it has ever been tried, but I fancy the Collard Turtle-doves would make good nurses of these tiny pets.) If the young tumblers are very fine, or the weather cold, it may be necessary to shift them several times; thus, several pairs may be shifted in rotation, the Almonds themselves taking an elder pair of some of their companions. Their loft should be kept scrupulously clean. They are fond of bathing; their water must be kept clean and sweet, and their food must be of the best quality. Each pair should be provided with a separate breeding-pen, so constructed that it can be closed at pleasure, either to keep in a troublesome gent, or to prevent others annoying a weakly one. Earthen pans should be provided for nests, placed on a shelf in the pen, and short straw or fine heath twigs for building materials. When the young are sufficiently old, they should be placed on the floor of the pen to prevent their disturbing the old ones when sitting again, or injuring themselves by falling down. A registry should be kept of all birds, and marriages, and many other particulars. A great deal of care and attention is necessary to insure success. No one will, therefore, wonder, at the high prices paid for good birds.

FREAK OF NATURE.—There is a plum tree in this village now in full blossom, which bore fruit the present season.

[Woonsocket Patriot.]

SALE OF MR. BOLDEN'S GRAND DUKE BULL CALVES.

SEPTEMBER 5th, an important sale of young bulls and some pigs of superior breed, the property of S. E. Bolden, Esq., took place at Springfield Hall, near this town, by the celebrated auctioneer, Mr. Stafford, of London. The bulls, it must be observed, were all by the far-famed bull, Grand Duke, (which animal was sold by Mr. Bolden in 1853 for 1,000 guineas) and were all from cows of first-rate character and breeding. The celebrity which this breed has obtained, throughout the country drew together a large assemblage of the most noted breeders of stock from various parts, and among whom we noticed the Hon. Noel Hill, Mr. Sainsbury, Mr. Wetherell, Mr. R. Booth, Mr. Sandy, the agents of Lord Hill, Lord Balcarras, Lord Burlington, Mr. C. Towneley, and Mr. Foljambe, several of whose stock took some of the first prizes at the Royal Agricultural Show at Lincoln; and among our local celebrities were Mr. C. Whalley, Mr. Ellison, Mr. John Pritt, and Mr. Carr. The bidding in most instances was very spirited, and the various lots were knocked off as follows: Cavandish, roan, calved Sept. 1, 1852, Lord Hill, 50 guineas. Veteran, red, calved Nov. 1, 1853, Rev. J. D. Jefferson, 40 guineas. Constantine, red and white, calved Nov. 12, 1853, T. Lamb, Esq., 36 guineas. Iron Duke, red, calved January 21, 1854, Mr. Foljambe, 40 guineas. Second Duke of Bolton, red roan, calved March 11, 1854, was the subject of a very spirited competition, and was eventually purchased by Messrs. Sanday and Smith for 90 guineas. Second Duke of Cambridge, red, calved April 14, 1854, also caused a very severe competition, and was knocked down at 100 guineas to Mr. R. Bell. Duke of Wellington, roan, calved June 1, 1854, Mr. Carr, 40 guineas. The average being within a few shillings of £60 each.

It was with gratifying feelings that we noticed the encomiums bestowed upon Mr. Bolden's cattle generally, and which includes a young bull out of a sister to the Grand Duke, which Mr. B. is retaining for his own stock; and also two heifers of the Duchess breed, and which were especially admired by the gentlemen assembled. We were informed that these young bulls averaged higher prices than any other lot of bulls sold this year.

ANOTHER NEW PEA.

During the last winter I promised to give you the result of any experiments, either of my own or of my neighbors, that might be of interest to the agricultural portion of your readers.

If the pea, of which I write, is planted early, say with corn, it will produce two very heavy crops. This fact I have established beyond all question—and the facts which I here state will be found to be true by any one who will pursue the same course I did; and here let me premise that I am engaged in no speculation, nor have I any intention of doing so. I have spoken freely to my friends in relation to this pea, and have promised to supply many free of cost. I say this much to stop that eternal cry of "humbug" by those *old fogies* who are ever ready to put their heel upon any fact and every principle of which their great grand-fathers were ignorant.

About two years since I received from Mr. Hardy Walker, near Benton, a few bushels of these peas, who told me at the time that they would produce two crops from the same vine. In other words, if the peas were gathered as they matured, they would continue to bear until frost, though I found that what might be called the second crop, was so light that it was hardly worth gathering. Upon

examination I found that the old stem or vine which produced the first crop, would die—and a new vine, smaller and less luxuriant, would put out and produce new fruit. This fact induced me to save the the first crop of peas, and cut off the old vine near the ground and cure it for my stock; and then see if new sprouts or vines would not put out and produce a second crop—and this experiment has succeeded to my entire satisfaction. I have this year produced two separate and distinct crops of peas from one and the same planting, one of which I have already gathered and thrashed out; and the second is now bearing very finely and beginning to mature. I will now give you dates and figures which my overseer and myself both know to be correct.

I had a field of about twenty-five or thirty acres, sandy land, every alternate row of which was planted in corn and pinders. On the 8th day of May the stand both of corn and pinders was indifferent. In the missing places I planted this pea; at that time we were suffering for rain, and got none until the 17th of May; in consequence of which the peas were slow in coming up. After the rain, however, they came up and grew off very well. They did not spread over the land as do most varieties of the cow pea, but grew up in clusters, resembling somewhat the bunch squash; and did not therefore interfere with the cultivation of the corn and pinders—and on the 2d day of August, before the fodder in the same field was ripe enough to save, I gathered fifty-three bushels of peas, which I have since thrashed out and measured. I am very confident that if they had been planted in a patch to themselves, that there would have been no more than four or five acres, and this I think is an extravagant allowance. After gathering the peas, I cut off the vines, about two and a half or three inches above the ground, and cured them for my cattle. This was all done by the thrash gang, and at a time when they had hardly anything else to do. At almost any other season of the year, I would have found it very inconvenient to have gathered the peas and save the vines, and this is one of the great advantages arising from the early maturity of this pea. I had just finished hoeing and plowing, and my fodder was not ripe enough to save, so the peas did not interfere at all with my crop, either in cultivating or gathering it. Some ten days or two weeks after this—that is, after the peas and vines were taken off, I discovered young vines shooting out from the old stubble—this was about the middle of August; and to-day, the vines are bearing finely, and promise as good a yield as the first crop. I am confident that by the middle of October, barring frost, I will be able to gather another very fine crop, which I am determined to do, no matter how white the cotton may look, and let the second crop of vines remain as a pasture. I have been in the habit of using this pea at my own table, and find it equally as palatable as any other variety of the cow pea, and the negroes are very fond of it. My impression is that the pea should be planted with the corn, at the same time, and they will certainly yield two crops.

J. D. F. WILLIAMS.
[Alabama Planter, Sept. 21.]

POTATOES IN IRELAND.—The Belfast *Mercury* says: "The magnitude of the crop for 1854, is certainly very much beyond that ever before known in this country. Taking a low average, we should say that the gross value of Ireland's potato lands this season, can not be under £15,000. Ireland contains now not more than six millions and a half of inhabitants, and the potato crop for the present year is estimated to be worth seventy millions of dollars, or rather more than ten dollars for each man, woman, and child.

Horticultural Department.

MASSACHUSETTS HORTICULTURAL SOCIETY.

[We wrote this report for our paper several weeks ago, but having so many Cattle Shows, and fruit and other exhibitions to record, we could not give place to it.]

This Society made one of the largest and best display of fruits at its exhibition in Boston, on the 13th, 14th and 15th of September, that has ever been made in this country.

Pears, of course, formed the main attraction, when such growers as Marshall P. Wilder, Samuel Walker, Robert Manning, C. M. Hovey, Josiah Richardson, B. V. French, Josiah Stickney, and a large number of others, vied with each other to exhibit to the members and delegates of the American Pomological Society, the products of their orchards. Mr. Wilder had over two hundred dishes of different varieties, and several other persons had almost an equal number of kinds, and as well grown.

The two last-named gentlemen, Mr. Stickney and Mr. French, took the first and second premiums, of \$30 and \$20, for the twelve best varieties on exhibition.

We never saw better grown specimens of pears in any exhibition, in any part of our country. The dish of Flemish Beauty, which took the second premium, held fruit of extraordinary size.

In Apples the display was also very large and fine. We have not seen, in the most favored districts of western New-York, finer or better dishes of all the best varieties of apples.

Mr. B. V. French took the first premium, and he had over one hundred varieties that were eminently worthy of it.

Peaches.—A moderate quantity of very choice and large peaches on the tables, bore testimony to the ability of Boston to vie with any part of our country in the production of this luscious fruit.

In Grapes, of course, the exhibition was attractive. The Concord grape was on the tables in abundance. In appearance it resembles well grown specimens of the Isabella. In flavor and quality, it is not equal to either the Isabella or Catawba; but, on account of its being so much earlier, it is an acquisition. It has very little pulp, is quite juicy, but not of the pleasantest flavor. Although a fair table grape, yet it is a little foxy. Several gentlemen of experienced taste went to Concord and ate the fruit from the vines, and agreed in the above opinion. Mr. Philemon Stewart, from New-Lebanon, N. Y., had a pleasant seedling grape, resembling the Catawba, on exhibition, which was named the Northern Muscadine. A half dozen other persons had seedling or native grapes, but all proved very foxy, on trial. Mr. A. W. Stetson had a professed cross of the Black Hamburg; but it was so foxy and indifferent we could discover no indications of its having any relationship to that fine grape. Mr. Thomas Waterman, of Boston, had a black native grape that was "good." Mrs. Diana Crehore, who originated the Diana grape, had fine specimens of this pleas-

ant table variety, with several others. They were much of the quality of the Catawba.

The new Cogswell apple, and one or two other new kinds, were displayed to good advantage.

Mr. J. B. Baxter, of Philadelphia, had a Beurre Clairgeau pear on the stand, weighing fourteen ounces.

Mr. Geo. W. Willis exhibited fine specimens of the Chelsea nectarine, and Mr. W. C. Strong, some very large specimens of Damascus and other foreign grapes.

Mrs. Field, whose recipe for tomato figs was published some time since in the *Agriculturist*, had a box of them on exhibition; and after fairly testing them, they were pronounced "excellent"—very much superior to any other substitute for figs, and by many preferred to the genuine article, as they are not so tough, and have a little higher flavor.

We must delay reference to the flowers to another time.

HORTICULTURAL DEPARTMENT OF THE CONNECTICUT STATE AGRICULTURAL SHOW.

The tent devoted to Horticultural productions, was under the immediate charge of the New-Haven Horticultural Society. The lateness of the season prevented a greatly varied display, but the show of apples, pears, grapes, and watermelons was very large.

Of apples, in excellent order the Hon. Charles Matthewson, of Woodstock exhibited 34 varieties; P. L. Hart of West Cornwall 32; John T. Norton of Farmington 29; Wm. Rogers of Litchfield 25; W. H. Chandler of Pomfret 25; Robbins Battel of Norfolk 15. Good specimens of several varieties were also exhibited by Dr. J. B. Whitcomb of Brooklyn, J. McClellan of Woodstock; John E. Wiley of Eew-Haven, E. C. Clark and others. We do not remember to have ever seen a better display of this most valuable of all fruits.

Of Pears, Hovey & Co. of Boston exhibited some 175 varieties; Chas. Dickerman of New-Haven 49, C. B. Lines 17; Dr. Totten 17; John E. Wiley 13. Among a number of other exhibitors of this fruit we noticed Charles Beers, Eli Ives, W. B. Ives, Jonathan Stoddard, Misses Gerry, &c.,

The show of grapes was very large and the specimens truly fine. Among the growers of these were Hovey & Co. of Boston, (the Concord); Joseph Eldridge of Norfolk; E. C. Clark, Dr. W. B. Ives, Jas. Craig, C. B. Lines, A. Holford (gardener to E. C. Read), George Gabriel, and many others of New-Haven; J. T. Norton of Farmington; Dr. Gold of West Cornwall (a bunch of Syrian Grapes weighing 4 lbs. and another of Black Hamburgs near by as large). These are but a part of the names of the exhibitors.

The Watermelons were in larger numbers than we have ever seen out of the New-York Market; and we doubt if a single collection ever presented a greater display of varieties. Julius & Gorham of Hamden alone exhibited 26 varieties. There were also some specimens of quinces, peaches &c. The two most attracted objects in this tent were a large Pomegranate tree in full bearing, exhibited by Dr. E. H. Bishop of New-Haven,

and a large cornucopia, several feet high, and formed of 100 varieties of grasses, chiefly native, collected and arranged by Dr. A. P. Munson of the same place.

VERBENA SOUVENIR DE JANE HANSON.

"This beauteous family to cares unknown,
Were born for pleasure and delight alone,
Gay without toil, and lovely without art,
They spring to cheer the sense and glad the heart."

This very lovely *Verbena* was raised by Mr. P. F. Croft, of Philadelphia, in the United States of America, from whence a figure of it has been sent. It is of first-rate excellence. Its form is nearly a *complete circle*, edges without notch, and surface nearly even, slightly cupping to the outside. Of the light-colored Verbenas, it far exceeds all others, nor do we know any other *Verbena* equal to it for form and beauty. It merits a place in every flower garden. We understand it is one of the most charming varieties for bedding purposes, and produces a beautiful contrast with the high-colored ones.

Every successive season we have additional beauties, as well as a closer approximation to perfection in form, in this most valuable and lovely genus. So universally, are our gardens ornamented with Verbenas, that were they now to become extinct, we should have a vacancy that no other plant we possess could adequately make up for such a deficiency. We feel rather more than a usual interest in admiration of this lovely section of Verbenas, from the circumstance of a member of our own family having obtained the first *Verbena melindres* brought to this country, and under whose care it first bloomed. Beautiful as it was, we did not anticipate that it was the first of an almost numberless family of varieties, which should not only surpass it in magnificence but in superiority of size and shape, and be the object of *universal* admiration; for who is there that sees the lovely Verbenas, which add so much to the beauty and ornament of our flower gardens at the present day, that is not pleased with them. It is not, however, generally known that the *Verbena* was held in high estimation and venerated by the ancients of our own and other countries. The very name of the *Vervain* (*Verbena*) carries our thoughts back to the darkest ages of superstition, and to the religious customs of the ancient heathens; and although they were in almost all particulars ridiculously absurd, yet their antiquity and intimate connection with our own forefathers, invest them with a claim upon our particular attention. While it was held in reverential regard by them, and we so much admire the beauties of the improved race, we are taught the lesson, that it becomes us to feel grateful that we live in a brighter day, illumined by the mild rays of *Christianity*.

The derivation of the name *Verbena* is somewhat uncertain; it originally signified any herb used to decorate altars for religious purposes; and this being so universally employed, received the appellation of *The Verbena*.

The *Verbena* sustained a considerable part in the impositions which were practised upon the credulous in ancient times, and hence it is so frequently mentioned in profane history. The Magi (termed Wise Men) of the ancient Elamites or Persians, made great use of this plant in their worship or adoration of the sun, always carrying branches of it in their hands when they approached the altar. The magicians also employed the *Vervain* in their pretended divinations, and affirmed that, by smearing the body over with the juice of this plant, the person would obtain whatever he set his heart upon: and

be enabled to reconcile the most inveterate enemies, and make friends with whom he pleased, gain the affections and cure the diseases of whom he listed. When they cut this plant it was always done when neither the sun or moon was visible, and they poured honey and honeycomb on the earth as an atonement for robbing it of so precious an herb.

The Greeks called it "*The Sacred Herb*," Juno's tears, and *Dovewort*; and it was with this plant only that they cleansed the festival table of Jupiter before any great solemnity took place, and hence, according to Pliny, the name *Verbena* is derived. It was also one of the plants which was dedicated to the Goddess of Beauty. Venus the victorious wore a crown of Myrtle interwoven with *Verbena*.

The Romans continued the use of this plant in their sacred rites, sweeping their temples and cleansing their altars with it, and sprinkling holy water with the branches. They also hollowed or purified their houses with it to keep off evil spirits. Their ambassadors or heralds at arms, wore crowns of it when they went to announce war or give defiance to their enemies; and which is thus noticed by Drayton:

"A wreath of *Verbena* heralds wear,
Amongst our gardens named,
Being sent that dreadful news to bear,
Offensive war proclaimed."

Virgil mentions it as one of the charms in use:

Bring running water, bind those altars round
With fillets, and with *Vervain* strew the ground."

The Druids, both in Gaul and Britain, regarded the *Vervain* with the same veneration which they bestowed on the *Mistletoe*, and like the Magi of the East, they offered sacrifices to the earth before they cut this plant in the Spring, which was a ceremony of great pomp. Pliny tells us that the Druids made use of it in casting lots, and in drawing omens, and in other pretended magical arts:

"Dark superstition's whisper dread
Debar'd the spot to vulgar tread;
'For there,' she said, 'did fays resort,
And satyrs hold their sylvan court,
By moonlight tread their mystic maze,
And blast the rash beholder's gaze'"

Walter Scott.

The Druids held their power through the superstition of the people, and as they were great pretenders to magic and divination they excited the admiration, and took advantage of the ignorance and credulity of mankind; for by these arts they pretended to work miracles and to exhibit astonishing appearances in nature as well as to penetrate into the counsels of heaven.

Divested of these pretended powers, there is no doubt but that the Druids were better acquainted with the medicinal properties of herbs than any other class of men in their day since; their residences being in the recesses of mountains, groves, and woods, where vegetable productions were constantly courting their attention, it is natural to suppose that they would in some measure become acquainted with the qualities of plants in general. That the Druids of Gaul and Britain applied themselves to this study, and made great use of herbs for medical purposes, we have sufficient evidence, since we learn from scattered hints in Pliny's *Natural History*, that they sometimes extracted the juice of herbs and plants, by bruising and steeping them in cold water; and sometimes by infusion in wine; that they made potions and decoctions by boiling them in water; and we learn also that they frequently dried certain herbs before infusing them, and that they administered some plants by fumigations, and practised the art of making sarves and ointments of vegetables, for which they had great renown even at Rome, to which city they exported the *Vervain*, and it was hence called *Britannica*.

Although so many ages have passed away since the Druids and their pretended spells have been abolished, yet we frequently meet with lingering sparks of their imagined light among the vulgar, who upon every occasion cling to superstition.

Madame de Latour tells us that the shepherds in the northern provinces of France still continue to gather the *Vervain* under different faces of the moon, using certain mysterious ejaculations known only to themselves, while in the act of collecting this herb, by whose assistance they attempt to cure not only their fellow-servants, but their masters also, of various complaints, and they profess to charm both the flocks and the rural belles with this plant.

The Germans, to this day, present a hat of *Vervain* to the new-married bride, as if to put her under the protection of Venus victorious, which is evidently the remains of ancient customs.—*Floricultural Cabinet*.

THE PINK.

At the termination of another season, and while the blooms of 1854 are fresh on our memory, we will briefly record our impressions of what has been doing with the *Pink* since our last notice in the *Florist* for August, 1853; and this is the more necessary as there are so many new varieties coming under notice for the first time.

The early blooms this season, had a tendency to be rough on the edge, and but imperfectly laced. As the season advanced they bloomed much better. The display of this flower at the Royal Botanic Society's July exhibition was the best of the season, the flowers being generally as good as we remember to have seen them, being well laced, of good size, and without confused centers. Allowing for the influence the season has exercised on some varieties, our opinions given a twelvemonth since have proved tolerably correct. In speaking, then, of Mr. Bragg's flowers, we placed James Hogg as the best, and it undoubtedly is, although the lacing is occasionally too faint. The blooms of this variety exhibited at Basingstoke by Mr. Surman, gardener to J. C. Roberts, Esq., Twyford, near Winchester, showed as perfect a *Pink* as we remember to have seen. Dr. Maclean's flowers have exceeded our expectation, having all—with the exception of *Great Criterion*, the plants of which suffered so much during the long severe winter, that they never finally recovered—proved most satisfactory. *New Criterion* is a most superb flower, and opens dark purple, which changes to rosy purple as it ages, and is in either state a charming flower, full and smooth on the edges. *Brunette*, a heavily laced dark variety, is also a bold, noble flower, and has the largest petal and widest marking of any flower we know, and heavily laced as it is, there is a large space of white in each of the large, broad petals. *Adonis*, another of Dr. Maclean's seedlings, is a chaste smooth flower, very clear in its markings, petals smooth and laced with soft, rosy purple. Mrs. Norman, as shown by Mr. Baker, of Woolwich, has a very fine petal, and is altogether a first class flower. *Hale's Field Marshal* and *Hale's Mr. Weedon*, are two useful evenly-laced flowers. *Turner's Richard Andrews* is a large well-laced flower, and may be termed a broad petaled *Whipper-in*, as it resembles that variety, but has a wider and smoother petal. *Duke of Devonshire* is a flower with a smooth well-shaped petal, as full as *Great Britain*, and, like that variety, has rather too many petals, but its size can be reduced by leaving plenty of buds. *Looker's John Stevens* and *Juliet* are promising flowers, the former a dark purple and the latter a light purple laced variety; also Mr. Hoyle and Mr. Hobbs, red

laced flowers of good average quality, and good exhibition flowers. *Norman's Napoleon* is very dark laced, a striking flower with a large bold petal, but is rather thin, *Colchester Cardinal* has proved a fine flower, with first-rate properties, having a very smooth stout petal.

Of older varieties, *Maclean's Criterion* stands at the head; it has been very fine this season, and fuller than it is often seen. *Bragg's Jupiter* has been very fine, and *President* and *Purple Perfection* have been shown good. *Optima*, *Ada*, *Kate*, *Mrs. Wolf*, *Sarah*, *Lord Charles Wellesley*, *Arthur*, *Beauty of Salt Hill*, *Constance*, *Esther*, *Sappho*, *Lola Montes*, *Richard Smith*, *Titus*, *Lord Valentia*, *Perfection*, and *Hurlstone's Fanny*, have all been exhibited in very good condition, and are generally very good flowers. We have seen a few yearlings that possess excellent properties, but refrain from enumerating them until another season has confirmed their being dissimilar, and desirable new varieties, as they appear at first to be. Some of the best flowers we have had were produced from plants wintered in small pots and planted out in spring, and, considering the small space they occupy during the winter, and there being no risk of losing them should the season be unfavorable, this plan should be more generally adopted. [London Florist and Fruitist.

DRIED PEACHES.—PEACHES as usually dried are a very good fruit; but can be made vastly better if treated in the right way. Last season the recipe which had quite a circulation in the papers of drying the fruit by a stove after halving it and sprinkling a little sugar into the cavity left by the extracted pits, was tried in our family. The fruit was found to be most excellent; better to the taste of nine out of ten persons than any peach preserves, by far. The peaches, however, were good ones before drying; for it is doubtful whether poor fruit can be made good, by that process, or any other. [Prairie Farmer.

COLORING CORN.—A French farmer has succeeded in giving to maize or Indian corn any color he chooses by the following plan: Having received from China a specimen of a pearl white color, the grains of which were very small but very beautiful, he was desirous to obtain the same grain, but of other colors. For this purpose he planted by the side of some the American maize of a red color, and the result was a crop of grain of a pink tint, with some of a bluish, and others of a green color. He made a similar experiment with the maize of *Tucarora*, the grain of which is as white as *Carolina rice*, and he thus obtained a crop, the ears of which were about fourteen inches in length, and the grains of a blue color. Another time he planted some maize of the color of amber among some of the black maize of *Syria*. The ears attained the length of twenty-two inches, and the grain was of different colors. The yellow maize, on being planted near some of the brown maize of *Central America*, produced some of dark brown color, which ripens eight days sooner than the other sorts. The farmer now possesses one hundred and fifty-three different varieties of maize, and his object in continuing his experiments is not only to change the color at will, but also to obtain varieties which will ripen earlier, as well as larger and longer ears, and thus increase the produce.—*Ex.*

CURE FOR SCRATCHES.—Mix one ounce of chloride of lime and one quart of water; wash the parts well; after which apply white lead, ground in oil. This has never failed to cure.

American Agriculturist.

New-York, Wednesday, Oct. 18.

REPORTS OF SHOWS.—The season of State and County Shows will soon be over, when we shall be able to devote our columns to matters of a less local character.

This week we have allotted considerable space to a report of the first Show of the Connecticut State Society, both on account of the general interest of the Exhibition, and because we have a large number of readers in that State.

THE COST OF IGNORANCE.

GROWING PEACHES.

A business transaction has lately come to our knowledge, which aptly illustrates both the ignorance of horticultural matters in rural communities and its great expensiveness. The bargain was made, in one of the centers of light, in New-England, where the people are as intelligent, and as well furnished with schools and churches, as in almost any part of the country.

A smart business-man who took the papers, and had seen something of the productiveness of fruit trees in his own grounds, desired to turn his knowledge to some good account. He proposed to his neighbor to set out such a lot—by the way, one of the best upon his farm—with choice varieties of peach trees; to market the fruit for him for fourteen years, and to give him one half of the profits.

Mr. D. was disposed to look favorably upon the proposition. He was not realizing from the lot more than twenty dollars profit per acre; and as the soil and climate were favorable to that fruit, he might reasonably expect, on an average, from fifty to one hundred dollars a year, per acre, as his share of the profits. It would certainly be less trouble to care for the trees, than to harvest the hay; and, in any event, he could hardly be a loser by the bargain. So Mr. D. made a written contract with the smart business-man, to furnish him with land for a peach orchard, for the term of fourteen years, on the above-mentioned conditions.

The fruit-grower succeeding so well with Mr. D., made contracts with Mr. B., C., and others, until his peach orchards sprung up in every direction around him, and thousands of baskets of the finest fruit are sent to market every year. The whole expense of stocking an acre with trees hardly exceeds thirty dollars, and the trouble of marketing is very little. The business operation, on the part of the fruit-grower, is certainly a very clever one, as he will get his capital back again every year, for the whole term of the contract.

But just look at the enormous price Mr. D. and his neighbors have to pay for their ignorance of fruit-growing! Had they known as much as the fruit-grower, they would have invested their thirty dollars where he did his, and would now be pocketing his profits. Some of them are paying, annually, one hundred dollars for the use of his knowl-

edge—which is neither more nor less than a tax upon their own ignorance. And yet some of these gentlemen would probably consider ten dollars an extravagant outlay for horticultural journals, which would, in a year, give them the results of the experience of the best fruit-growers in the country. For nothing, but vice, do men have to pay so dearly, as for their ignorance.

WHEAT CAN BE GROWN.

The above incident is only one of a thousand in farm life, illustrating the same truth. There are large districts, whole towns, and even counties, where scarcely a bushel of wheat is grown, from the simple lack of knowledge. Though the finest wheat in the world is grown in the same latitude and climate, they have the absurd notion that their soil will not raise wheat. So they import wheat from the new lands of the West; and in every wheaten loaf that comes upon their table, pay a tax upon their ignorance. Peruvian guano will bring wheat in any part of New-England. So will good stable-manure, mixed with large quantities of muck.

MOWING MACHINES.

Many a farmer, this Summer, has paid large sums for cutting his hay, which might have been saved had he known that mowing machines were a reality; and that one of them would do the work of six men, and do it much easier and better.

IMPROVED STOCK.

Mr. D. keeps a miserable, coarse-wooled flock of sheep, cutting but two to three lbs. to the fleece, because he does not know that a fine-wooled sheep, yielding a fleece of twice that weight, costs but little more in the keeping than the natives. He keeps only native cows, and makes no selection even of these, because he does not know that cows yielding twice as much cheese and butter, are as easily kept as those that now stock his farm. His sty is filled with long-nosed, raw-boned porkers, because he has never heard of Suffolk pigs, or if so, does not know where or how to procure them.

BARN CELLARS AND MANURE.

Mr. D. has no barn cellar, though his barn stands upon the brow of a hill, on purpose to make the digging easy. He has all the materials to make 500 loads of manure every year, and is content with half that quantity. His soil would easily grow 60 bushels of corn to the acre, and he thinks he is doing wonders when he gets 40.

GARDEN NEGLECTED.

Mr. D.'s garden is also neglected, from the misapprehension that it will not pay so well as the cultivation of field crops. He has set but few fruit trees, and many of these are dead for want of care.

CROPPING ORCHARDS.

Mr. B. has an orchard of thrifty young trees just ready to bear, but grows impatient for a crop of some kind, and sows it with rye. He gets his crop indeed, but the grain has taken from the soil the ammonia and the mineral elements needed by the young trees; their growth is stunted, and fruit-bearing is postponed for years. He pays dear for his ignorance.

And thus we may go through the rural districts, and find on almost every man's premises abundant evidence that he is a very heavy tax payer, and the most heavily taxed of all his possessions is his ignorance. There is some sense in paying well for an article of use or luxury; but what folly it is to make such great outlays for an article that is a discomfort, as well as a disgrace. The school master of the garden is abroad, with his text-books, periodicals, fairs, and practical illustrations of good horticulture. Why should not every man that owns even a small patch around his house, take lessons, and turn his soil to the best advantage?

SOCIAL POMOLOGICAL GATHERING.

NEW-HAVEN POMOLOGICAL SOCIETY.

ON Thursday evening last we had the pleasure of attending a meeting of the New-Haven (Conn.) Pomological Society, in company with some fifteen or twenty fruit growers, and others, who were drawn together by the State Agricultural Show. One word in regard to this Society.

Ten years since, a number of those interested in improving fruits, organized themselves into a society, with the late Gov. Edwards as President, Dr. Eli Ives, Vice-President, and the late Dr. Virgil M. Dow, Secretary. From that time to this, the fifteen to twenty members of this association have met weekly, or semi-monthly, during the season of fruits, to test, discuss, and decide by vote, the merits of different varieties exhibited. When fruits are not plentiful, other topics, such as manures, culture, &c., are taken up. These meetings are held at the residences of the members, in alphabetical order.

The meeting above referred to, was held at the residence of Mr. Elizur E. Clarke, who is an active and efficient member, or so we should judge from the large variety of specimens upon his table of his own culture. Among them were twelve varieties of foreign grapes, cultivated under glass, beside native grapes, seedling peaches, and several varieties of pears. On the table were also a profusion of pears and other fruits, contributed by the members, and by Messrs. Hovey & Co., of Boston, who sent in twenty varieties.

These different fruits were tested, and commented upon by the gentlemen present; but there were so many to be examined, and so many to try them, that the usual form of voting upon their respective merits was dispensed with. At 10 o'clock the company separated, after passing two hours and a half very pleasantly together.

We hope, hereafter, to report, from time to time, a synopsis of the proceedings of the above society, and thus extend to a wider sphere the practical benefits which have, heretofore, been chiefly confined within the circle under the immediate influence of the members. We shall also be glad to receive, for publication, reports from other similar associations. An interchange of opinions and results, between different localities, will be productive of mutual as well as general benefit.

CHESTER COUNTY SWINE.—It is said that this excellent breed was first imported into Pennsylvania from Bedfordshire, England, in 1818. They maintain their stand in Chester County against all other breeds; if the farmers there would select the best breed from those only, they would soon become famous and sought for all over the United States. They are thrifty and grow large, and similar in character to a medium Yorkshire pig.

LETTER FROM IRELAND—ABUNDANT CROPS.

DUBLIN, September 22, 1854.

FRIEND JUDD: Having completed a tour through the main agricultural district of Scotland and Ireland, I may say that the harvest is truly a plentiful one. The reapers are in the midst of their pleasant labors. The grain appears excellent, and the crops will probably exceed in extent any known for many years past. You must have noticed the capital article in a recent number of the *Times*, concerning this abundant harvest. The increase of '54 over '53 can only be estimated by tens of millions of pounds sterling. This will be doubly pleasant to Americans, now that (if I am correctly informed) it is ascertained to a certainty that your crops are to prove unusually meager.

The potato disease is dealing sorely with the husbandmen of England and Scotland; Ireland, save in certain portions of the west, enjoys a glorious exemption from its ravages. Paddy smiles "like a basket of chips," over his good fortune; and, indeed, Erin has great cause for joy.

I was present at the annual show of the "Glasgow Horticultural Society," held last week. The display was not extensive. Of hollyhocks, dahlias, and the coarser garden products, there were many exquisite specimens. The vegetables—nothing to be at all proud of.

I am glad to see that my friend Bagg succeeded in getting the drove of Kentucky cattle across the 'pond' in safety. He must certainly have had his hands full. The importation of so large a stock by the enterprising men of Kentucky, promises much for the future condition of her cattle. Let New-York look to her laurels.

Yours, hastily,
R. C. McCORMICK, JR.

GREAT NATIONAL CATTLE SHOW.

THE United States Agricultural Society, of which the Hon. Marshall P. Wilder of Massachusetts is President, will hold a National Show of Cattle, open to general competition, without sectional limit, on the 25th, 26th and 27th days of this month, at Springfield, Ohio. Six thousand dollars will be awarded in premiums, several of which are larger than have ever been offered by any Agricultural Society either in this or other countries. Among these we notice the following: \$500 for the best bull and five cows or heifers, of one year or upwards, from any one herd. \$300 for the best Durham bull. \$200 for the best Durham cow. Other large premiums are offered in the respective breeds.

The judges in the various classes have been selected with great care, and constitute a phalanx of Agricultural talent of the first order. Among the names we find those of Gov. Wright of Indiana; Col. Stevens, John A. King, Lewis F. Allen and Col. Johnson, of New-York; Cassius M. Clay and Brutus J. Clay, of Kentucky; Judge Watts and Dr. Elwyn, of Pennsylvania; Judge Musgrave and Col. Medary, of Ohio; Richard Peters, of Georgia; S. B. Findlay, of Virginia; and from Massachusetts, Moses Newell, B. V. French, John Brooks, Paoli Lathrop, Simon Brown, and other distinguished Agriculturists.

Extensive preparations have been made for the accommodation of strangers. Extra trains will convey passengers to the neighboring cities and towns, who cannot obtain lodgings at Springfield. Private houses will also be open for the reception of guests.

The principal railroads will take stock *free of charge*, and passengers at *half price*. On stock the freight must be paid on the passage out, and on the certificate of the Secretary of the Show, that the animals have been exhibited and have not been sold or exchanged, the money paid for transportation will be refunded, and they returned free to the point from which they started.

Visitors should be careful to obtain excursion tickets on the several railroads, and at Springfield to have them stamped by the Secretary of the Show, in order to make them available on their return at half price. Passengers from New-England will take the New-York Central Railroad at Albany.

On Thursday, October 26th, at 2 o'clock, P. M., a Grand Agricultural Banquet will be held on the grounds, and at which Col. Wilder, the President of the Society, will preside. The President of the United States, the heads of departments, the Governors of the States, with other distinguished guests, have been invited to attend. It is anticipated that this will be one of the most interesting and imposing parts of the exhibition, and in which ladies, as well as gentlemen, will participate. The exhibition of cattle will be the largest ever held in America, if not in the world, and the concourse of people will be immense.

Persons desirous of obtaining any further information in regard to the exhibition or the transportation of passengers or stock, may procure the same by addressing Wm. S. King, Esq., Secretary of the United States Agricultural Society, at Horticultural Hall, Boston.

The Railroads hereinafter mentioned will convey passengers and transport stock on the following conditions: Excursion tickets half the usual rates. Stock for exhibition at the show will be transported free of charge, under the following regulations: the regular rates of freight to be paid on such stock, going; and on certificate of the Secretary of the Show, that the animals were exhibited and have not been sold or exchanged, the money paid for transportation to be refunded, and they returned free to the point from which they started.

Little Miami and Xenia Railroad.
Cincinnati, Hamilton and Dayton Railroad.
Sandusky, Mansfield and Newark Railroad.
Zanesville, Wilmington and Cin. Railroad.

Cleveland, Columbus and Cin. Railroad.
Central Ohio Railroad.
Bellefontaine and Indianapolis Railroad.
Cincinnati, Zanesville and Cleveland R. R.
Ohio and Mississippi Railroad.
Southern Michigan and Northern Ind. R. R.
Springfield, Mt. Vernon and Pittsburgh R. R.
New York Central Railroad.
Pennsylvania Central Railroad.
Madison, Indianapolis and Peru Railroad.

The Mad River and Lake Erie, the Cleveland and Pittsburgh, the Ohio and Pennsylvania, the Ohio and Indiana, and other Roads will carry passengers and cattle at half the usual rates.

For the American Agriculturist.

BEES.

[This communication was received several weeks since, and from a hasty glance, was supposed to belong to that class of articles which go into our drawer marked "Good at any time." This will account for its late appearance.—Ebs.]

An agricultural paper can not be expected to go into the rudiments of all the matters pertaining to the farm; it presumes on the reader being in possession of at least *some* knowledge. Yet there is such a vast difference in the comprehension of your readers, that I bespeak a goodly share of patience for your dull ones—myself being one of the number. Those that understand intuitively will take care of themselves. I see no better way than for each of us to make our particular wants known. No doubt it would be the means of bringing out, in detail, particulars for each case, from correspondents as well as editors; whoever happened to know best might answer.

Probably you have not a reader who is more interested in bees than myself; and if there are any further advantages than I have, I want them. There were some remarks in the *Agriculturist*, not long since, which I did not understand, at least practically, as well as some not in accordance with my experience. May I ask some questions, and make some remarks?

First. "Before commencing operations with bees, they should be gently sprinkled with sugar-water," &c. Now I do not know whether the sugar, in proportion to water, is in homœopathic doses or otherwise—water simply sweetened, or a thick syrup; and then I don't understand the *modus operandi* of getting it on the bees before "commencing operations." Suppose I wish to take a box filled with honey and bees; how to sprinkle the bees inside I can not imagine. Then, again, I wish to ascertain the actual condition of a stock; how can I make it available? When the hive is first molested, *then* is the greatest danger of stings. If the hive is first to be inverted, two-thirds of the risk is over. I am in the habit of using tobacco-smoke, and have recommended it to others; thought it the best of any thing, as it seems to be available in all cases, even *before* you begin. If the sugar-water is better, please give us a few more particulars. "The best way is as good as any."

With respect to artificial swarms, the simple matter of dislodging the bees may be suf-

ficiently minute. *Artificial* swarming ought to mean, driving out part of the bees for a new colony, and have *that* and the old stock prosper. Now the tyro who undertakes to produce this result, with only directions to get out the bees, would be quite sure to find deep water. For instance: where should the new swarm stand? Place it ten feet distant, and nearly all the bees would desert and return to the old stand, notwithstanding they would leave the old queen by doing so; but few, probably, beside young bees that had never been out to mark the location, would choose to remain. Place it on the old stand and set the old stock away, the same result would attend that. None but very young bees would be left to guard the combs against the attacks of the moth. Reason dictates, and experience sanctions, setting them somewhat close together—the new stand near to the old one; then, if they are not satisfactorily divided, you can add to either, by putting it nearer the old place.

Another point, of vital importance, belongs to artificial swarming, and that is, to provide the old stock with a queen. We are assured that when the queen “dies,” or is lost—say driven out—“they rear a new one.” This, I suppose, has been true often enough to get up the assertion; but all my experiments to bring about such a result have failed. Such as lose their queen accidentally, not one in ten ever provide another. A portion can not because it happens at a time when no eggs or larvæ exist in the hive; another portion, even when they have the means, because—well, I will not say, because I don’t happen to know. This is probably one cause why Jones’s dividing hive was so soon discarded. Now I have not much faith in any plan to rear prolific queens from eggs or grubs, destined for workers. Still, others may have been more successful; and if so, here is a chance for them: If there is any process by which the failures will not average more than one in ten, *I will pay fifty dollars to the person who teaches me the art.* In the swarming season, when young queens are being reared for the purpose of sending off colonies, I have found it safe to make *artificial swarms*; at any other time, extremely hazardous. Those who are not satisfied should try it—nothing like our own experience.

Relative to the drones not being expelled until “about six months after they come to maturity,” I think, with a little further observation, you would alter the time, and say, “from a short time before maturity till four or five months after—according to circumstances.” They are produced with a yield of honey, and destroyed with its failure. I have known one stock to destroy three broods in one season—the first of June, last of July, and last of September. Probably not one of the whole lived three weeks, except the last; and a great many were sacrificed before they left the cell. In some sections, the flowers of buckwheat, in August, produce facts in the rearing of broods of drones, which a great many bee-keepers never witnessed. If Natural History is important, ought we not to have all the facts belonging to it?

“The queen, being the mother of the whole colony, reigns supreme, and all yield a willing and entire submission.” Now I would suggest the possibility of there being as much fancy as truth in this assertion. Can we not easily fancy the bee-hive a republic—the bees controlling the queen, as much as she does them? The idea of a monarchy, in any shape, in this country, is, or ought to be, repudiated; it is repugnant to my feelings, at least. As the mother, she is necessary, and is protected by the bees; and they oppose an associate in her sphere as strongly as herself. The moment a strange queen is introduced, she is surrounded by the workers and made prisoner—escape with life being next to impossible. When no help is present, she rushes to the attack herself. As a republic, *we* have a President. Should an aspiring individual, supported by a few of the States, presume to divide or share the honors, you would see a commotion in the political bee-hive, so closely resembling the one of the insect republic, that it would puzzle a philosopher to tell the difference. That the mother-bee has an influence as to the labors of those over whom she presides, is extremely doubtful. I have had some twenty stocks that have lost their queens this summer—averaging one in ten. Three days after such loss occurs, it is impossible for me to discover it by their actions, or by any difference in their labors in bringing home loads of pollen and honey; and let me add, I doubt whether any one else can—yet, my doubts are not proof. Should there be a nice point that I never discovered, I would give something handsome to have it explained. I do not pretend that I have explained all the points mentioned; it would require too much room. I have already taken more than I intended; but I will respond to any particular that may be called for.

With regard to the entertainments you mentioned, I would say, that I can not boast of “choice specimens, of either fruits, flowers, horses, cattle, sheep, or fowls”—perhaps not of bees, unless their numbers and thrift would render them such. Neither have I the “fifty-four advantages of an improved hive,” like Mr. Langstroth, belonging to mine; yet, I have some improvements; but endeavor to have *no more* than will *pay*. If you, or any one else sufficiently interested in bees, would stop, on the New-York Central R. R., Palatine Church, Montgomery Co., I will try to get up something interesting in this line. Those who do not keep bees, I would urge to do so. Those who have some, I would recommend to keep more. Of the profits, I can produce *weighty* arguments, by the hundred, of snowy whiteness; and should they fail to be persuaded, they would have to resist some of the *sweetest* inducements ever offered.

August, 1854.

Author of “Mysteries of Bee-Keeping Explained.”

REAL “ENGLISH PLUM PUDDING.”—One lb. each of flour, beef, suet, sugar, currants and raisins; four eggs, one pint of milk, spice to the taste; tie in a bag—allow no room for swelling, and boil four hours. This rule is from an English family. R.

For the American Agriculturist.
JOTTINGS AT SODUS POINT.

SODUS POINT is situated on Lake Ontario, about half way between Oswego and Rochester, and is formed by Sodus Bay, being between that and the lake. There is but little, except Nature’s work, to admire at the Point. Nature has formed one of the best—said to be the best—harbors in the northern States. Many efforts have been and are still being made, to secure at this Point something of a commercial place. All that is necessary, is an outlet by Railroad. A Company was formed in the winter of 1851–2, to construct a Railroad from Sodus Point to Newark, from thence to Hall’s Corners, to intersect with the Canandaigua and Elmira Road, thereby forming a direct route to New-York City, by the New-York and Erie Railroad, and to the coal mines of Pennsylvania. Nearly one half of the grading is completed, but for want of funds the Company have abandoned the work, or, at least, ceased operations until means shall be raised to complete it.

Should this road be completed, it would furnish a good market at the Point for the surrounding country, whereas farmers are obliged to go to Lyons—a distance of 14 miles—with their produce. Many years ago, Sodus Point was the great market for all of the country south as far as Geneva and Canandaigua.

Sodus Point, previous to the war of 1812, was quite a village. At that time it was all, or nearly all, destroyed by fire. A few of the old houses yet stand, as relicts of days gone by. Great quantities of fish are caught here, and many come a great distance to amuse themselves with the finny tribe. Chestnuts are also abundant, and people may be counted by hundreds, in chestnut-time, gathering these nuts. I was informed by a resident, that he had seen hundreds at a time, in the woods and groves, chestnutting. The land lies rolling, and much chestnut timber grows on it.

The soil is a mixture of yellow sand and clay, and is good for wheat and grass. Fruit is grown in abundance, and of the best kinds. There are some very fine farms within two or three miles of the Point. As a general thing crops are not so forward, by ten days or two weeks, as they are a few miles south of the lake. But fall frosts never injure the crops.

S. A. C.

[For the American Agriculturist.
SUBSTITUTE FOR A SPRING-HOUSE.

A very good substitute for a spring-house was made a few years ago, by a gentleman in Hinds County, Miss.—Jesse Lott, Esq.—as follows: When near the bottom of a large cistern which he was digging, the workmen opened a vein of water, and resolving to change the cistern to a spring-house, he made a box about four feet deep, to contain the water, which does not rise above it; cemented or walled the sides with brick, built a flight of stairs, closets, and a house over it, and thus had a supply of good water, and one of the coolest and best places for keeping milk, butter, fresh meats, vegetables, etc., I have ever seen.

In the absence of natural springs, might not a similar method be profitably adopted for making spring-houses or dairies, for keeping milk, &c., where water can be obtained sufficiently near the surface of the earth, and when, as in the case mentioned above, there is not too great a rise of the water during the wet seasons, on or near hill sides, where the surplus water could be carried away by drains, constructed at a trivial expense?

CINCINNATI, September, 1854.

"A little humor now and then,
Is relished by the best of men."

OCTOBER.

GORGEOUS are thy woods, October,
Clad in glowing mantles sere—
Brightest tints of beauty blending,
Like the west, when day's descending—
Thou 'rt the sunset of the year.

Fading flowers are thine, October!
Droopeth sad the sweet bluebell,
Gone the blossoms April cherish'd—
Violet, lily, rose—all perish'd,
Fragrance fled from field and dell.

Songless are thy woods, October,
Save when red-breast's mournful lay
Through the calm gray morn is swelling—
To the list'ning echoes telling
Tales of darkness and decay.

Saddest sounds are thine, October;
Music of the falling leaf
O'er the pensive spirit stealing,
To its thrilling depths revealing—
"Thus all gladness sinks in grief."

I do love thee, drear October,
More than budding, blooming Spring;
Here is hope, delusive smiling,
Trustful hearts to grief beguiling—
Memory loves thy dusky wing.

Joyous hearts may love the Summer,
Bright with sunshine, song, and flower;
Life hath been a wintry river,
On whose ripples gladness never
Gleameth brightly since that hour.

'Twas in thee, thou sad October,
Death laid low my bosom's flower;
But the heart whose hopes are blighted,
In the gloom of woe benighted,
Better loves thy kindred bower.

"Hearts would fain be with their treasure"—
Mind is slumb'ring in the clay,
Wand'ring here, alone, uncheery;
Deem it strange the heart should weary
For its own October day!

EARTH AND AIR.

BY BARRY CORNWALL.

How beautiful, how wonderful
Thou art, sweet Air!
And yet, albeit thine odors lie
On every gust that mocks the eye,
We pass thy gentle blessings by
Without a care!

How beautiful, how wonderful
Thou art, sweet Earth!
Thy seasons changing with the sun—
Thy beauty out of darkness won!
And yet, whose tongue (when all is done)
Will tell thy worth?

The poet!—He alone doth still
Uphold all worth!
Then love the poet!—love his themes,
His thoughts, half hid in golden dreams,
Which make thrice fair the songs and
Of Air and Earth. [streams,

PROFUSION OF LIFE IN THE OCEAN.—Not a shell or a stone is brought up, but is thronged with living beings. Every branch of weed gives shelter to multitudes of creatures—some temporary lodgers, some permanent residents. Life is a parasite upon life. The *surpula* builds its stony case on the abode of the shell-fish, and the delicate lace-work of the moss coral overspreads the *surpula*. Over the stem of the sea-weed creeps the graceful plumes of the zoophyte spring. These, again, are thickly invested by the pretty cells of many smaller species; and these, in turn, minute as they are, often bear in profusion the curious forms of microscop-

ic animalcules. Let us take a stone from the heap that is lying in our boat. It is a perfect museum in itself. It is richly colored in parts by the *nullipore*—one of the lowest forms of vegetable life, which does for the scenery of the ocean what the moss and lichen do for the scenery of the upper world. Here is a circular cluster of cells, "looking like beautiful lace-work carved in ivory;" here, a little saucer of the purest whiteness, containing within it a number of stony tubes, the habitation of the whole company of polyples. A sponge overgrows one portion of the stone, itself the home of many a living thing; a sea anemone is present, and near it a small star fish. There are worms, too, in plenty, and more of life and beauty beside than we have place to describe. It is pleasant to think of the happy existence which a single stone may support. The forms to which we have chiefly referred are visible to the unassisted eye; but, as Humboldt remarks, "the application of the microscope increases the most striking manner our impression of the rich luxuriance of animal life in the ocean, and reveals to the astonished senses the consciousness of the universality of being."—*Journal*.

A GOOD SPEECH.—Daniel Webster, a short time previous to his last public reception in Boston, was traveling from New-York to this city, by the overland route. When the cars reached Springfield, Mr. Waite, the well-known excellent conductor, stepped into the forward car, and, as usual, announced—"Springfield station—twenty minutes allowed passengers to dine!" Mr. Webster, who was sitting by him, arose, and pleasantly tapping him on the shoulder, remarked: "Young man, that is one of the most interesting speeches I ever heard in my life." "Yes, sir," calmly replied the conductor, "all speeches are good in which the speaker and the hearer heartily sympathize." "Very true," said Mr. Webster, "and I have always noticed, that those speeches are always considered best which are finished in good season for dinner."—*Times*.

A WOMAN OF GOOD SENSE.—You see this lady turning a cold eye to the assurances of shopmen, and the recommendations of milliners. She cares not how original a pattern may be, if it be ugly, or how recent a shape, if it be awkward. Whatever law fashion dictates, she follows a law of her own, and is never behind it. She wears very beautiful things, which people generally supposed to be fetched from Paris, or at least made by a French milliner, but which as often are bought at the nearest town, and made up by her own maid. Not that her costume is either rich or new—on the contrary, she wears many a cheap dress, but it is always good; and she deals in no gaudy confusion of colors.

THE NATIONAL BABY SHOW, at Springfield, was a failure. Only one hundred and twenty babies, out of a population of twenty-five millions, were on hand, or rather, in arms. Double that number could be turned out of a single Ward in this city at two minutes' notice, and as fine, fat, healthy and rollicking imps as ever rolled over a carpet.

[Dollar Newspaper.

MARRIED.—On Wednesday, the 13th ultimo, by the Rev. T. A. Eaton, Mr. WILLIAM INSLEE, of New-Orleans, to Miss THERESA BIRCH, of this city.

Strange! what he hated most when young,
He dearly loves in riper years;
And Birch, which once his boy heart wrung,
Now proves his solace, calms his fears.
In Birch he finds his earthly bliss,
Nor hesitates the rod to kiss.

[Washington Star.

ARTESIAN WELLS.

The Earth's Secrets.—The St. Louis Democrat of a late date, has a very interesting account of the progress made by Mr. Belcher, of that city, downward towards the center of the earth, in search of pure water for his extensive sugar refinery. His Artesian wells commenced six years ago, has now reached the depth of 2,200 feet, being, it is said, the deepest in the world—the one at Grenelle, near Paris, being sunk 1,961 feet, and another one in France reaching the depth of 1,150 feet.

The drill has thus far passed through a constant succession of the most stubborn rocks, with the exception of a stratum of soft slate of 100 feet, and it is now on its way through yellow sandstone. A steam engine of twenty-five horse power is used to work the drills, the diameter of the bore being five inches. The Democrat says:

The kinds of drills used are various, some being adapted for pulverizing the rock, others for hooking up soft substances, and then there is an instrument called a rimmer, used for cutting the sides of the bore to make it round and smooth. Tubes are also used containing valves, which catch the loose particles of rock and carry them to the top of the well. The drilling rods are made of stout oak wood, are about two inches in diameter and thirty-two feet long, having iron screws and fastenings at the ends by which a continued rod may be formed of any length.

The presence of one or more persons is constantly required for the purpose of turning the drill around in the bore, as its vertical motion continues. At present, the operators are engaged in enlarging the cavity, at the point where the soft slate stone occurs, for the purpose of introducing a copper tube to prevent the continual caving in of the soft parcels, which are constantly sloughing from the sides. We were told that this falling in of the blue slate stone had left a cavity as large as a good sized house. We believe it is the intention to introduce copper pipes from the top to the bottom of the well, as soon as it is finished, although the hard rocky sides would seem to make it unnecessary. The object to be gained by this, is to shut out the various kinds of waters from the sides, so that the pure stream from the bottom may reach the top without any mixture.

At the depth of 700 feet a vein of salt water was struck, and at 1,500 feet an immense vein of sulphur water burst forth, which has been running over since its discovery in a large stream from the mouth of the well. This water is the same as that of the Blue Lick Springs, in Kentucky, and possesses a purity and freshness of taste quite superior to that which reaches us in barrels and casks. It is carried off by a large sewer, leading to the river. It seems too wasteful, that such profuse quantities of this celebrated water should be permitted to flow away, but the refinery needs the clear, unadulterated element, and it must have it, and nothing else. Other medical waters have been discovered, we believe, but they have been of little consequence.

SHREWD.—"I sell peppermints on Sunday," remarked a good old lady who kept a candy shop, "because they carries 'em to church and eats 'em, and keeps awake to hear the sermon; but if you want pickled limes you must come week days. They're secular commodities."

A SAD EFFECT of the Maine law in Portland is, that the city is driven to hiring men to do the work formerly done by the inmates of the alms-house—so badly has the alms-house degenerated. Here is food for the thoughts of tax payers.

LOSS OF "THIRDLY."—Rev. Mr. —, minister of —, had the custom of writing the heads of his discourse on small slips of paper, which he placed on the Bible before him, to be used in succession. One day, when he was explaining the second head, he got a little warm, and came down with such a thump upon the Bible with his hand that the ensuing slip fell over the edge of the pulpit, though unperceived by himself. On reaching the end of the second head, he looked down for the third slip, but alas! it was not to be found. "Thirdly," he cried, looking around with great anxiety. After a little pause, "Thirdly," again he exclaimed, but no "Thirdly" appeared. "Thirdly, I say my brethren," pursued the bewildered clergyman, but not another word could he utter. At this point, where the congregation were partly sympathizing with his distress, and partly rejoicing at such a decisive instance of the impropriety of using notes in preaching, which had always been an unpopular thing in the Scotch clergy, and old woman rose up and thus addressed the preacher:—"If I'm not mistaken, sir, I saw Thirdly fly out of the east window a quarter of an hour syne." It is impossible for any but a Scotchman to conceive how much this account of the loss of thirdly was relished by that part of the congregation which condemned the use of notes.—*Chumbers's Scottish Books.*

PROFANE LANGUAGE.—It is related of Dr. Scudder, that on his return from his mission in India, after a long absence, he was standing on the deck of a steamer, with his son, a youth, when he heard a gentleman using loud and profane language. "See, friend," said the doctor, accosting the swearer, "this boy—my son—was born and brought up in a heathen country, and a land of pagan idolatry; but in all his life he never heard a man blaspheme his Maker until now." The man colored, blurted out a sort of an apology and moved away, looking not a little ashamed of himself. If there is any custom more silly than duelling, it is that of using profane language; but it is as common as lying, and there is hardly a dirty-nosed urchin in the street that will not swear as bravely as any "gentleman" that walks Broadway.

A TRAP FOR A TROUBLESOME TONGUE.—Sheridan was one day very much annoyed by a fellow member of the House of Commons, who kept crying out every few minutes, "hear! hear!" During the debate he took occasion to describe a political contemporary that wished to play the rogue, but had only sense enough to play the fool. "Where," exclaimed he with great emphasis, "where shall we find a more foolish knave or more knavish fool than he?" "Hear! hear!" was shouted by the troublesome member. Sheridan turned round and thanking him for the prompt information, sat down amid a roar of laughter.

NOT BAD.—"Is a Man and his wife both one?" asked the wife of a certain gentleman in a state of stupification, as she was holding his aching head in both hands. "Yes, I suppose so," was the reply.—"Well, then," said she, "I came home drunk last night, and ought to be ashamed of myself." This backhanded rebuke from a long-suffering and affectionate wife effectually cured him of his drinking propensity.

TOO LAZY TO STOP.—There was once a clergyman in New-Hampshire, noted for his long sermons and indolent habits.

"How is it," said a man to his neighbor, "that Parson —, the laziest man living, writes these interminable sermons?"

"Why," said the other, "he probably gets to writing and is too lazy to stop."

THE EMU FOWL.

I HAVE not seen noticed in the pages of the *Poultry Chronicle* a variety of fowl, which, if it can not demand our admiration for its beauty, at least deserves our attention as being one of the many wonderful varieties which the late poultry mania has brought to light; I mean the fowl to which fanciers have given the name of the *Emu Fowl*. Of this variety, I believe, only a few exist in England, and therefore, to some of your readers, it may not be uninteresting to hear something about them. Were it not that I believe they are generally recognized as a distinct breed, my own experience, so far as it goes, would rather lead me to believe that they are only a sort of a class of freaks of Nature—if Nature can be said to have any rule in the production of her monstrosities. In one of the exhibitions in Baker-street, which I attended last year, I remember seeing one solitary specimen of this variety, and at the last Birmingham Show, there was a pen of them exhibited, I think, by Mr. Baily, of Mount-street; but excepting these, and the one specimen in my own yard, of which I mean to speak, I do not remember ever to have seen any. These creatures are covered all over with a sort of silk, of a light dusty or very light red color, and have no feathers except in their wings, where they have a few things that look like worn-out quills. They have no tails, are not good flyers, and the hens (my experience does not extend to cocks) weigh about five lbs. They have not the black skin of the Silk fowl.

And now I will give you an account of the way in which the specimen of which I write came into my possession. In the Spring of 1851, I had given me six Cochin Chinese eggs, from a yard where none other than Cochin China fowls were kept, excepting, perhaps, one or two common hens; but, however, there were only Cochins, and the eggs which were given me were laid by Cochin hens. I took the six home with me, and succeeded in hatching three chicks. Two turned out very handsome Cochin cocks, the smallest of which weighed 10 lbs. last summer; and the third egg turned out, to all appearance, a thorough-bred Emu hen, and, in fact, I have no hesitation in saying, she is as like those exhibited in Birmingham as one hen can be like another. I kept her (and, indeed, have her now), and from her eggs hatched several chicks, by one of these cocks that had been hatched from the original six eggs, thinking that if there was some taint of Emu in the blood of my friend's fowls, this cross might perhaps produce some more of these silky Emu fowls; but such has never been the case. They were always the sort of brute you would imagine would be the consequence of a cross between an Emu hen and a Cochin cock; but, at the same time, my Emu hen, while differing entirely in appearance from her brothers, and, in fact, all her relatives, as far as I know them, possesses all the moral and domestic traits of a Cochin—the same gentle tractability of temper, the same proneness to sitting, the same fecundity in laying eggs. [Poultry Chronicle.]

This is the same kind of fowls as we kept when a boy, forty years ago. They came from China, and were called the *Merino* fowl—why this designation we have never learned. They bred true and well together; but were so tender, owing to the deficiency of feathers, that they would often freeze to death in winter. They would do well in a climate six degrees south of us.

We do not believe they are a "freak of nature," or that they are "sports" from the

Cochin China, otherwise they would not have a breed so true to themselves; that is, admitting that we are not mistaken in supposing the old *Merino*, the same as the modern *Emu Fowl*.

MACHINERY IN FARMING.

IT is not enough that farmers avail themselves of all the advantages which chemistry affords in its application to their art; it is not enough that they learn how to save as much as possible of the manures made on their premises, and the best methods of applying these and also purchased specific manures; it is not enough that they know at what seasons and to what depths their soils should be cultivated. They must perform as many of the operations of farming by machinery, as machinery can be made to perform to advantage.

There is no other way in which agriculture can keep pace in respectability, pleasure and profit, with other arts. Without this expedient it will be outstripped by them, and sink steadily in comparative rank.

By machinery, as we use the word here, we mean all the mechanical contrivances which can be substituted for manual labor, and combined with manual labor so as greatly to increase its productiveness.

And the policy which we recommend includes also animal labor, and as a more powerful coöperator with it.

So far as a horse or an ox can be made to do the work of five men, the horse or the ox earns the net product of five men's labor for the employer. If one man cultivates as much corn, and cultivates it well, with one horse, attached to a cultivator, as his neighbor cultivates with ten hoes in the hands of ten men, it is easy to see which of the two is traveling the fastest on the road to wealth.

So in cutting grass, in planting and harvesting grain, in shelling corn, and in various other operations of the farm, machines can do the work for a small per centage of the cost of manual labor.—*Makin's Courier.*

TRANSPLANTING FOREST TREES.—Mr. Geo. Jaques, of Worcester, Mass., writes to *Hovey's Magazine*, as follows: The accompanying shellbarks (Hickory nuts)—well ripened, as you will find them—grew this season upon a tree which my brother and myself transplanted twenty-one months ago, i. e., in January, 1851. The tree was moved, at the same time with three others, a distance of two miles, by what is called the *frozen-ball* method of transplanting. It is now in a fine healthy condition, and, with the others—all of which are over thirty feet, and one of them forty feet, in height—serves at once for ornament and shade. Upon our new place, they produce a fine effect in taking off and relieving the inevitable rawness of a recent settlement.

A simple statement of these facts may encourage others to do likewise. Knowing the great difficulty of transplanting our hardwooded forest trees, particularly the oak and several species of the hickory, you will concede that our experiment has been eminently successful. The expense of transplanting did not exceed twelve dollars per tree.

GOOD TIMES FOR THE FARMERS.—The other day one of our Indiana farmers, living a few miles west of Jeffersonville, took to that market four bushels of sweet potatoes—sold them for two dollars a bushel (\$8 in all); with five dollars, entered 40 acres of fair government land; and tying up the balance in his leather purse, journeyed homeward, contented and happy.

[Indianapolis Sentinel.]

PREPARING POULTRY FOR MARKET.

We have often noticed the careless and slovenly manner, and little attention paid to the external appearance of poultry offered for sale in our markets; and we have likewise noticed the ready sale and higher price where due regard was paid to have the skin all sound and clean; the breast not mutilated by a long cut, the shrinking skin exposing the drying meat covered with hay seed or chaff; but well covered all over with fat of a rich golden yellow. Much of the poultry exposed for sale has been through the process of scalding to facilitate the picking; this practice should never be resorted to. It turns the rich yellow of the fat into a tallowy hue, and oftentimes starts the skin so that it peels off, unless very carefully handled. No cut should be made in the breast, all the offal should be taken out behind, and the opening should be made as small as possible; the inside should be wiped out with a dry cloth, but no water should be used to cleanse them. With a moist cloth take off the blood that may be found upon the carcass. In picking, great care should be taken not to tear the skin; the wings should not be cut off, but picked to the end; the skin of the neck should be neatly tied over it, if the head is cut off. Most people like to see the heads of fowls left on—it makes a better show. The heads of ducks and geese should not be cut off.—*N. E. Farmer.*

Much care and attention are required after the poultry is dressed and cool, and it should be carefully packed in baskets or boxes, and above all, it should be kept from freezing. A friend, who was very nice in these matters, used to bring his turkeys to market in the finest order possible, and always obtained a ready sale and the highest price. His method is to pick them dry, and dress them in the neatest manner; then take a long, deep, narrow box, with a stick reaching from end to end of the box, and hang the turkeys by the legs over the stick, which prevents bruising or disfiguring them in the least.

Too much should not be exposed at a time for sale, nor should they be hauled over too often. Appearance is everything with poultry, as well as other articles, and has great influence on the purchaser.—*Bement.*

NEW GUANO ISLAND.—Private advices received yesterday, from San Francisco, refer to the recent report of the discovery of a new guano island, on the coast of the Pacific. It was understood, that one of the principal American houses at San Francisco, in connection with some parties in the Sandwich Islands, had received information on the subject, and had purchased a revenue schooner, named the Frolic, and a clipper bark, the Emily, of 400 tons, to proceed at once for cargoes. These vessels were fitted out with as much secrecy as possible, but were believed to have taken a considerable number of men and a large supply of implements. The situation of the island is supposed to be about the latitude of Acapulco. It is said that it has no good harbor, and that the guano will have to be shipped from it in small vessels to some port near. Other accounts allege that the island is somewhere on the coast of Lower California.—*Ex.*

WHEAT FROM ENGLAND.—Extract of a letter received by a Produce house of this city:

"It is reported here that 25,000 bushels of wheat have been ordered back from England. A little wheat has actually arrived this morning in the Atlantic, about 1,000 bushels. We understand English wheat weighs 60 lbs. per bushel.—*Cleveland Herald.*

MORE RARE BIRDS AND POULTRY COMING.

We learn that the steamer Washington, which left Southampton on the 11th inst., has on board one of the choicest lots of pure bred domestic and aquatic fowls which has yet been brought over to this country. Mr. John Gile, of Woodstock, Connecticut, who is a well known dealer in pure stock, has been absent during the Summer, scouring great Britain, France, and Germany, in search of the best specimens of the feathered tribe.

From the list forwarded by Wm. Giles, we see he has secured Black Spanish, Surrey and Dorking Fowls; Seabright gold and silver laced Bantams; Japanese and White Pea Fowl; gold, silver, pied, white, ring-necked and Bohemian Pheasants; white and black Swans; Aylesbury and Rerien Ducks; white-fronted Barnacle, Egyptian and Toulouse Geese. Also a splendid assortment of ornamental Ducks, including the far-famed Mandarin Ducks, which have been sold in London at seventy-five guineas per pair. He also brings some fine Cotswold and New Oxford sheep.

We believe Mr Barnum is making arrangements to secure the entire lot for Exhibition at his Museum, for a week or so immediately after their arrival, and then about the first of November, they will be sold at auction, on account of the importers.

Markets.

REMARKS.—Flour has fluctuated the past week from 25 to 87½ cents advance, on the last of the preceding week, but finally settled only 25 to 50 cents higher than for our last. Wheat has risen more, in proportion, than Flour. Rye has declined. Corn has fluctuated 3 cents per bushel, but left off about the same as the preceding Saturday. Provisions, nothing new. Wool is a little lower, and dull again.

Cotton has advanced ¼c. per lb. No change in other Southern products.

The weather continues favorable, with a copious rain on Saturday, clearing off cool.

PRODUCE MARKET.

SATURDAY, October 14, 1854.

The prices given in our reports from week to week, are the average wholesale prices obtained by producers, and not those at which produce is sold from the market. The variations in prices refer chiefly to the quality of the articles.

There is quite a lively market this morning, though it was exceedingly dull yesterday. The warm weather affects it very much.

The change in produce to day is slight. Potatoes are a shade higher, good Mercers being scarce and selling readily, while common ones are abundant and dull. Of other vegetables there is nothing worthy of note.

The season of pears is nearly past, so that they are not worth quoting. Grapes have been dull of sale the last week, it being the close of the season with them, too. Cranberries are quite plenty, and remain about the same. Butter, eggs, and cheese, no change.

VEGETABLES.—Potatoes, Mercers, \$3@3.50 ½ bbl.; White, \$2.25@2.50; Sweet, Philadelphia, \$3.50; Virginia, \$2.50@2.75; Turnips, White, \$1.25; Russia, \$2; Beets, \$3 ½ hundred bunches; Carrots, \$3; Parsnips, \$4; Marrow Squashes, \$2 ½ bbl.; Cabbages, \$3@5 ½ hundred; Pumpkins, \$4@8 ½ hundred; Celery, \$1.50 ½ dozen.

FRUIT.—Apples, \$2@2.50 ½ bbl.; Grapes, 6c.@9c. ½ lb.; Cranberries, \$6@7 ½ bbl.

Butter, State 21c.@23c. ½ lb.; Western, 17c.@18c.; Eggs, 19c.@20c. ½ doz.; Cheese, 10c.@11c. ½ lb.

NEW-YORK CATTLE MARKET.

Monday, Oct. 16, 1854.

The Cattle Market has not improved at all since last week, and, if anything, was more dull. The appearance was a little more favorable this morning; but when we came away this afternoon, the sales were very slow, and the prospect was, that many cattle would be left over. The truth is, the market is over stocked—not with beef cattle, but in many cases with lank, slippery animals, unfit even for farm use. Still there were several good droves to redeem the market, which altogether was better than last week. Such cattle sold readily, as they should.

We still hear complaints about the irregularity in transporting cattle over some of the railroads. Droves have a set time and place for watering, feeding, &c., which is made impossible by these delays. This alters very materially, the appearance of cattle, and often occasions a loss, which ought to fall elsewhere than on our stock owners.

Superior quality beef is selling from 9c.@10c. ½ lb.; fair quality 7c.@9c.; inferior 6½c.@7½c.

We noticed 100 full-fed cattle from Clarke County, Ky., owned by Wm. Gateskill. These were Durham grades, large frames, and good quality, and selling at 9c.@10c.

John Maxey had 102 cattle from Madison County, Ohio, fed by himself. They were wintered on corn, were fair Western cattle, and sold at about 9c.; weight estimated at 700 lbs.

Joseph Williams had two droves from Chester County, Pa., one of them acknowledged to be the best in the yards. They were well fed, fat, and sold by John Murray, at 10c. ½ lb. Weight estimated at 750 lbs. The other drove was also full fed, and good beef. Weight about 725 lbs., and selling at 9c.@10c.

P. S. Triplet had 76 grass-fed steers from Kentucky, sold by Geo. Ayrault, from 8c.@8½c.; quality fair, and estimated to weigh 650 lbs.

Thomas White had in market 137 cattle, corn fed and grazed, from Morgan County, Ill.; weight estimated about 650 lbs. Sold from 8c.@9c.

Killough & Harlan had 80 grass-fed cattle from Chester County, Pa.; selling from 9½c.@10c.; weight estimated at 750 lbs., and superior quality.

A. Anderson had 93 grass-fed cattle from Ross County, Ohio, and sold by Mr. Culver for 7c.@7½c.; weight about 550 lbs. Inferior quality.

John Bines, of Vermillion County, Ill., had 110 grass-fed steers; sold at from 7½c.@8c.

The following are about the highest and lowest prices:

Beeves.....	7½c.@10c.
Cows and Calves.....	\$18@55.
Veals.....	4c.@6c.
Sheep.....	\$2@5.50.
Lambs.....	\$1.25@5.
Swine.....	4½c.

Mr. Chamberlain reports beeves, 7½c.@10c.; cows and calves, \$20@50; veals, 4½c.@7c.; sheep, \$2.50@6; lambs \$2@4.

Mr. Browning reports beeves, 7½c.@9½c.; cows and calves, \$25@50; veals, 5c.@6c.; sheep and lambs, see sales below.

Mr. O'Brien reports beeves, 6c.@8c.; cows and calves, \$25@40.

Washington Yards, Forty-fourth-street.

A. M. ALLERTON, Proprietor.

RECEIVED DURING THE WEEK.	IN MARKET TO-DAY.
Beeves,.....	3111
Cows,.....	39

1,000 ORNAMENTAL TREES—Suit-

able for Belts, Masses, Shrubberies, Woods, &c., in the best and hardiest varieties, strong and well grown—delivered in Boston and New-York. Price list on application.

B. M. WATSON,
56-63 Old Colony Nurseries, Plymouth, Mass.

WACHUSETT GARDEN AND NUR-

SERIES, New-Bedford, Mass. ANTHONY & McAFEE, Proprietors, successors to Henry H. Crapo, would invite the attention of the public to their extensive stock of

Fruit and Ornamental Trees, Flowering Shrubs, Rose Bushes, &c., Evergreens, Balsam Firs, American and Chinese Arbor Vite, Cedrus Deodara, Cryptomeria Japonica, Norway Spruce, Yew Trees, Tree Box, &c., &c.
An extensive assortment of Apple, Pear, Plum, Cherry, Peach, and Apricot Trees.

The stock of Pear Trees is very large, both on Pear and Portugal Quince Stocks, embracing every thing worthy of cultivation. All our Pear Trees are propagated and grown by ourselves, and

WARRANTED TRUE TO NAME.
The soil, climate, &c., of this locality being so favorable to the Pear, our Trees are unrivaled for HEALTH, vigor of growth, &c., &c.

They are all free from that destructive malady, THE PEAR BLIGHT, which has never existed in this locality.
Prices low, and a liberal discount to the trade.
New-Bedford, 1854. 17-68

AND PLANTS—Including every thing necessary to the Garden, Green-house, Nursery and Orchard, with all the recent introductions, at very low rates. Descriptive price Catalogue gratis. Carriage paid to New-York. Ornamental and other planting done in any part of the country. The best season for transplanting is after October 10. Address

B. M. WATSON,
56-64 Old Colony Nurseries, Plymouth, Mass.

SUPREME COURT.—In the matter of the

Staking of lands for a new Reservoir, between Eighty-sixth and Ninety-sixth-streets, and the Fifth and Seventh-avenues in the City of New-York.

To all owners, mortgagees, lessees, occupants, and other persons, in any matter, by judgment, decree or otherwise, entitled unto, or interested in the lands or premises above mentioned, or any part thereof,
Notice is hereby given that you are required to appear before the Commissioners of Appraisal in the above entitled proceeding, at the office, No. 293 Broadway, the third story front room, at 10 o'clock, A.M., on any day (Sundays excepted) on or prior to the 21st day of October next, and to produce the evidences to your title or interest therein. In default thereof, and in case the person entitled or interested as aforesaid shall not be ascertained by or be known to the said Commissioners, or be fully known, the same will be reported to the Supreme Court as belonging to unknown owners.

It being the desire to consummate this great improvement, and to present the report at the earliest day consistent with proper examination, and due regard to rights and interests affected, it is earnestly requested that all parties note and comply with the preceding notice, as no other or further notice will be issued.
Dated New-York, September 1, 1854.

EDWARD C. WEST,
ABRAHAM TURNURE, } Commissioners.
DANIEL DODGE.

ROBERT J. DILLON, Counsel to the Corporation.
N.B.—All papers published in the City of New-York are requested to publish the preceding notice until the 21st day of October next, once in each week, and to send their bills, with affidavits of publication, to the office of the Counsel to the Corporation, to be paid on the final taxation of the proceedings. 37

STATE OF NEW-YORK—Secretary's Of-

fice, Albany, August 10, 1854.—To the Sheriff of the County of New-York—Sir: Notice is hereby given that at the GENERAL ELECTION to be held in this State on the TUESDAY succeeding the first Monday of November next, the following OFFICERS are TO BE ELECTED, to wit:

A Governor, in the place of Horatio Seymour;
A Lieutenant-Governor, in the place of Sanford E. Church;
A Canal Commissioner, in the place of Henry Fitzhugh; and
An Inspector of State Prisons, in the place of Henry Storms;
All of whose terms of office will expire on the last day of December next.

A Representative in the Thirty-fourth Congress of the United States, for the Third Congressional District, composed of the 1st, 11d, 11d, 11d, and 11th Wards in the City of New-York; for the Fourth District, composed of the 14th, 14th, 14th and 14th Wards of the City of New-York; for the Fifth District, composed of the 11th and 11th Wards in New-York, and the City of Williamsburg in Kings County; for the Sixth District, composed of the 11th 11th and 11th Wards in the New-York; for the Seventh District, composed of the 11th, 11th and 11th Wards in New-York, and for the Eighth District, composed of the 11th, 11th and 11th Wards in New-York.

County Officers also to be selected for said County:
Sixteen Members of Assembly;
A Surrogate, in the place of Alexander W. Bradford;
A Recorder, in the place of Francis R. Tillou;
A City Judge, in the place of Velmore R. Beebe;
A Mayor, in the place of Jacob A. Westervelt;
A Register, in the place of Garret Dyckman;
A Commissioner of Streets and Lamps, in the place of George G. Glazier, who was appointed to fill a vacancy caused by the resignation of Henry Arden;
A Police Justice for the Second District, in the place of Daniel W. Clark, who was appointed to fill a vacancy caused by the death of John McGrath;
Two Governors of the Alms House, in place of Gustavus A. Conover and William Pinckney, appointed to fill vacancies;

A District Attorney, in the place of Lorenzo B. Shepard, who was appointed to fill a vacancy caused by the death of Nathaniel B. Blunt;
A Civil Justice and a Police Justice for the Seventh Judicial District, composed of the 11th, 11th, and 11th Wards;
A Police Justice for the Eighth Judicial District, composed of the 11th and 11th Wards.

Yours respectfully,
E. W. LEAVENWORTH, Secretary of State.

SHERIFF'S OFFICE, New-York, Aug. 14, 1854.
The above is published pursuant to the notice of the Secretary of State and the requirements of the statute in such case made and provided.

JOHN ORSER, Sheriff of the City and County of New-York.
All the public newspapers in the County will publish the above once in each week until the Election, and then hand in their bills for advertising the same, so that they may be laid before the Board of Supervisors and passed for payment. See Revised Statutes, volume 1, chapter 6, title 3, art. 3, part 1, page 140. [53-60] JOHN ORSER, Sheriff.

PERUVIAN GUANO.—First quality of

Fresh Peruvian Guano, just received in store.
R. L. ALLEN, 189 and 191 Water-st.

WILLARD FELT, No. 191 Pearl-street,

51-54

FRUIT TREES FOR SALE.—I have now ready for sale one of the most complete selections of Fruit Trees ever offered in this part of the country, and as thrifty and handsome Trees as can be found in the United States. Apples, Pears, Peaches, Plums, Grapes, Quinces, Strawberries, &c.

Subscribers to this paper will find in it the coming year full directions for managing Fruit Trees in the best manner, with a complete list of the best varieties.

WM. DAY, Morristown, N. J.

PEACH TREES.—The subscriber offers for sale, from their Nurseries at Rumson's Neck, Shrewsbury, N. J., Peach Trees of the choicest varieties. Orders for the same by mail to be directed to them at Red Bank, Monmouth County, N. J. [33-69] ASHER HANCE & SON.

FANCY FOWLS.—Shanghai Fowls—direct importations—and Golden Pheasants, for sale by

WM. DAY, Morristown, N. J.

FOR SALE, AT THE SOUTH NORWALK NURSERY, a fine stock of the New-Rochelle (or Lawton) Blackberry Plants, at \$6 per dozen; also the White-fruited variety at \$3 per dozen; also the new or pure Red Antwerp Raspberry. GEO. SEYMOUR & CO., South Norwalk, Conn.

51-76

SUPERIOR SEED WHEAT.—A LARGE assortment of the best varieties of improved Seed Wheat; among which are the Red Mediterranean, White Mediterranean, Soule's and Blue stem. For sale by

R. L. ALLEN, 189 and 191 Water-st.

FANCY FOWLS FOR SALE.—A variety of pure bred Fowls, Asiatic, Spanish and Game Fowls, Sebright, Black African, Antwerp, and other Bantams.

B. & C. S. HAINES, Elizabethtown, New-Jersey.

54-55

THE HORSE, THE HORSE,

NOBLEST OF DOMESTIC ANIMALS.
And the one most frequently ill-treated, neglected, and abused. We have just published a Book so valuable to every man who owns a horse, that no one should willingly be without it. It is entitled,

THE MODERN HORSE DOCTOR,
and is from the pen of that celebrated English Veterinary Surgeon, Dr. GEO. H. DADD, well known for many years in this country, as one of the most successful scientific and popular writers and lecturers in this branch of Medical and Surgical science. The Book which he now offers to the public is the result of many years' study and practical experience which few have had.

From the numerous and strong commendations, of distinguished men and the newspaper press, we select the following:

Extract from a letter from Hon. John H. Clifford, Ex-Governor of Massachusetts:

NEW-BEDFORD, May 11, 1854.
DR. DADD—Dear Sir: I hope your new work on the noblest creature that man has ever been permitted to hold in subjection—the Horse—will meet with that success which all your efforts in this direction so well deserve.

Your obedient servant,
JOHN H. CLIFFORD.

From Hon. Marshall P. Wilder.

BOSTON, May 13, 1854.

DR. DADD—My Dear Sir: I am greatly obliged to you for the valuable treatise, the results of your own investigations, which you have recently issued, hoping that it may meet with the patronage of a discriminating community.

I remain yours with great regard,
MARSHALL P. WILDER.

The "Modern Horse Doctor," by Dr. G. H. Dadd, is a manual of genuine science, and ought to be owned and studied on the score of humanity, as well as interest, by every man who owns a horse. [Boston Congregationalist.]

Dr. Dadd has had great experience in the cure of sick horses, and explains the secret of his success in this volume. [New York Tribune.]

The author of this work is well known as a most skillful veterinary surgeon. His book is based on the soundest common sense, and as a hand-book for practical use, we know of nothing to compare with it. [Yankee Blade.]

We know Dr. Dadd well, and are satisfied that he possesses most important qualifications for preparing such a book as this. [New-England Farmer.]

Messrs. Jewett & Co. have just published a very valuable work by Mr. Dadd, a well-known veterinary surgeon, on the causes, nature and treatment of disease, and lameness in horses. [Farmer's Cabinet.]

This is one of the most valuable treatises on the subject ever published; and no owner of that noblest of the animal race, the horse, should be without it. Especially should it be in the hands of every hotel and livery-stable keeper. To many a man would it be worth hundreds of dollars every year. [Ind. Democrat, Concord.]

By far the most learned and copious work on the horse and his diseases we have ever seen. [N. Y. Evangelist.]

One of the greatest and most commendable qualities of this work, is, it is practical and plain to the comprehension of those farmers and others for whom it is mainly designed. The course of treatment favors generally a more sanative and rational system of medication than that recommended in any previously existing works on farriery. No farmer or owner of a horse should be without this book. Stable-keepers, stage-proprietors and hackmen, we believe would derive profit from having at least one copy hung up in their stables for use and reference by their stable men. [Daily News, Philadelphia.]

There is more common sense in this book than any of the kind we have ever seen, and farmers and owners of horses would find it a matter of economy to possess themselves of it. It will be of more service than the counsel of a score of ordinary doctors. [Albany Courier.]

We deem this decidedly the best and most reliable work on the "Cause, Nature, and treatment of Disease and Lameness in Horses," ever published. [Nantucket Inquirer.]

What we have read of this book induces us to regard it as a very sensible and valuable work; and we learn that those much more competent to judge of its value, have given it their unqualified approval. [Eve. Traveller, Boston.]

This book supplies a great desideratum which Skinner's admirable treatise on the horse did not fill. Every man who has his own veterinary surgeon, and with much greater safety to this noble animal, than by trusting him to the treatment of the empirical itinerants who infest the country. It is well illustrated, and should be purchased by every man who owns a horse. [Eve. Mirror, New-York.]

This is a book that should be forthwith put into the hands of all who own or drive horses, whether for the dray or gig, for the plow, omnibus or road, for hard service or pleasure. [McMakin's Courier, Phila.]

A good, clearly-written book, which should be in the hands of every man who has a horse whose illis his affection or his purse make it worth while to cure. [Bangor Mercury.]

It is a valuable book to those who have the care of horses. [Hartford Herald.]

This is a scientific, thorough and complete treatise upon the diseases to which one of the noblest of animals is subject, and the remedies which they severally require. [Troy Budget.]

He is not worthy to have a horse in his care who will not use such a work to qualify himself for his duties to this animal. [Commonwealth, Boston.]

Published by JOHN P. JEWETT & CO., Boston.

JEWETT, PROCTOR & WORTHINGTON, Cleveland, Ohio.

For sale by all Booksellers. 50-53

HORSE POWERS THRESHERS AND

SEPARATORS.—The Endless Chain or Railway Powers of our own Manufacture, both single and double-gear, for one and two horses, which has never been equaled for lightness in running, strength, durability, and economy. They are universally approved wherever they have been tried.

2. The Bogardus Power, for one to four horses. These are compact and wholly of iron, and adapted to all kinds of work.

3. Eddy's Circular Wrought-iron large Cog Wheels, for one to six horses. A new and favorite power.

4. Trimble's Iron-sweep Power, for one to four horses.

THRESHERS.—Improved Threshers upon the best principles, threshing clean with great rapidity, without breaking the grain.

One-Horse, Undershot \$25

Two-Horse, do \$30 to \$35

One-Horse, Overshot \$28

Two-Horse, do \$33 to \$38

Separator, which greatly facilitates cleaning the grain and preparing it for the fanning-mill . . . \$7 to \$10

All the above-named machines are guaranteed the best in the United States.

R. L. ALLEN, 189 and 191 Water-st.

TREES and PLANTS.—PARSONS &

CO., Flushing, near New-York, offer for sale their usual assortment, with the addition of many rare novelties of Fruit Trees, for the Orchard and the Garden; Ornamental Trees, Shrubs, and Roses, for the Avenue, Lawn, or Cemetery; Vines for the Grapery, and Exotic Plants for Greenhouse culture. Catalogues can be obtained at No. 60 Cedar-st., or will be sent by mail to all post-paying applicants enclosing a postage stamp.

23-71

PUBLISHERS' ANNOUNCEMENT!

THIRTEENTH VOLUME OF
THE AMERICAN AGRICULTURIST,
THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the Agriculturist.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

COMPREHENSIVE IN ITS CHARACTER.

CORRECT AND VALUABLE MARKET REPORTS.

SUCH A PAPER IS DEMANDDE BY THE FARMING COMMUNITY.

ESSENTIALLY AN AGRICULTURAL PAPER.

AN INDEPENDENT JOURNAL.

EDITORIAL DEPARTMENT.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical Agriculture, and, in addition to these, a number of other eminent Agricultural and Horticultural writers.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and Post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms :

To single Subscribers.....	\$2 00	A YEAR,	\$2 00
“ Clubs of 3 do.	1 67	“	5 00
“ “ 5 do.	1 60	“	8 00
“ “ 10 do.	1 50	“	15 00
“ “ 20 do.	1 25	“	25 00

The money always to accompany the names for which the paper is ordered.

The Postmaster, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Postmaster, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, Weekly Tribune, or Weekly Times, or any other paper or periodical in this City, the cost not exceeding two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if inclosed and mailed in the presence of the Postmaster.

✎ Communications for the paper should be addressed to the Editors ; Subscriptions, Advertisements, and all matters relating to the business department, should be addressed to the Publishers,

ALLEN & CO., No. 189 Water-st., New-York.

Special Notices to Subscribers, Correspondents, &c.

SUBSCRIPTIONS can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September, as a half yearly volume of 416 pages, with a complete index, begins on each of those dates.

Those wishing their papers changed from one office to another, should give the name, County, and State, of their old and new Post-office.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Clubs may add to their number at the same rate per copy as was paid by the original members.

The paper is stopped when the time for which it is paid expires. A notice or bill is usually sent in the last number.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then inclose them in presence of the Postmaster. Give the Post-office, and the County and State. *Write these very plainly.*

Economical Arrangement to Furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished			
with Harper's Magazine, one year for	-	-	\$4 00
" Putnam's " " " "	-	-	4 00
" Knickerbocker " " "	-	-	4 00
" Eclectic " " "	-	-	6 00
" Littell's Living Age " " "	-	-	6 50
" National Magazine " " "	-	-	3 50
" Dickens's Household Words " " "	-	-	3 50

SEE LAST PAGE.

THE RHODE-ISLAND FAIR.

[The following report, forwarded by mail, did not reach the office till recently.]

The Agricultural Society of this State is one of the best managed and most efficient in the country, though this is but the fifth of its annual exhibitions. Under the present organization, it has already accumulated several thousand dollars, for the future use of the Society. Providence is the seat of its operations, and as this city is the center where four Railroads and several steamboat routes terminate, it greatly facilitates the attendance upon the fairs.

This year the Horticultural Society united with the Agricultural, in the exhibition. They occupied the large halls over the Railroad depot, which could not have been better adapted to their purposes had they been constructed exclusively for their use. The fair was held from the 12th to the 15th of September, and was well attended throughout.

THE PLOWING MATCH

Came off at the Plain farm, Olneyville, and drew together a large concourse. The work was beautifully done, and Benoni Matthewson, of Johnston, took the first premium. We were glad to notice the Michigan, and other improved plows, upon the ground. Mr. Halliday also made trial of a subsoil plow, to illustrate the benefit of deep plowing in a season of drouth. This and the Michigan are every year coming into more extensive use.

THE CATTLE SHOW

Was thought to be superior, in numbers and quality, to any thing ever witnessed in the city. The working oxen, from Cumberland, Smithfield, Cranston, and other towns, as well as the bulls, cows, heifers, and calves, afforded gratifying proof that the farmers of this State appreciate the value of, and are giving increased attention to, improved breeds.

There were several pens of fine South-down and Bakewell sheep. There is no good reason why Rhode-Island should not be, to a considerable extent, a wool-growing State. Every one, at all conversant with the soil, has observed extensive tracts of land that, in their present condition, are fit for nothing else but sheep pastures. The reason commonly assigned for not appropriating these fields to this use is, the ferocity of the dogs. We hope, for the credit of poor Tray, that his is a slander; but, if it be true, the case

admits of a remedy. Rhode-Island has a reputation for enforcing "law and order" upon a race more prone to be rabid than the canine, and undoubtedly the dogs' unrighteous proclivity to mutton could be arrested, by legal suasion or otherwise, if "the game was thought to be worth the candle." Little Rhody should have her own wool for her winter garments, and her own mutton for her tables.

THE SHOW OF SWINE

Was not large, but there were some fine specimens of Suffolk, and other breeds, that one, on beholding, could not suppress an involuntary thanksgiving that he was not born a Jew, and not likely to be converted to that faith.

THE POULTRY DEPARTMENT

Sustained the reputation of the State for fine fowls. This is one of the most profitable products of the State, and we were glad to see the varieties so well represented. Chapman should have been there to hear the crowing, and own beat. There were splendid specimens of geese, wild and mongrel ducks, California, and Poland, that did credit to the exhibitors.

THE MANUFACTURERS' SHOW,

In a State that makes so much cotton and woollen cloth as this, was not at all creditable. It looks very much as if they were already independent, and did not care to advertise their goods. Some measures should be taken, with these gentlemen of *cloth*, to get a better show out of them next year.

THE HORTICULTURAL SHOW

Was better than any body had a right to expect, after such a season of drouth as we have had. The number and variety of apples and pears were equal to any former exhibition that we have visited. They were not very much dwarfed, though not quite so fair as we have sometimes witnessed on the same tables. Peaches, we have rarely seen finer any where. The grapes were magnificent, particularly those grown under glass. This mode of culture is making rapid progress, we learn, in the gardens about the city.

THE VEGETABLES

Were thought to excel all former displays in this hall. A gentleman who is conversant with fairs, says that "nothing superior to these could be produced any where." We have certainly seen nothing to surpass them in any of our visits this Fall. Larger heads of cabbage, longer and smoother beets, finer marrow squashes, we do not expect to see anywhere. Mr. Allen's egg-plants were magnificent, and the watermelons needed no

label to say "come and eat me." Mr. Halliday had the largest collection. Nearly all his vegetables are raised on the very light lands at Elmwood, and tell a good story for the system of subsoiling he has adopted. Indeed, after taking a trip through this State, and seeing so much poor land, and then looking at these splendid products, we have pretty much come to the grave conclusion of Samuel Patch, "that some things can be done, as well as others." No one ought to despair of any soil, after visiting this show.

The annual address before the Societies was delivered, at the First Baptist meeting-house, by Rev. William Clift, of Stonington. His theme was, "the Agricultural wealth of Rhode-Island, and the duties it imposes upon her citizens." As this gentleman happens to be the husband of our wife, we forbear comments.

We are much indebted to the excellent President, and Secretary, of the Agricultural Society, to William Vial, Esq., Rev. Mr. Leavitt, and others, for hospitalities and kind attentions during our visit. Our hearty thanks are herewith tendered.

THE WHEAT TRADE OF GREAT BRITAIN.

We recommend a careful perusal of the following well written article on this subject, which we take from the last *Mark Lane Express* at hand. It seems from this that Great Britain and Ireland, have grown the past year within a small fraction of the estimated consumption in the United Kingdom for the ensuing year, and consequently that it will want to import only to keep for a *stock on hand*, which he estimates as desirable to hold to the amount of about 5,000,000 quarters. He calculates that only about 1,200,000 quarters of this will come from the United States and Canada; but it would be easy, we think, to double this amount of exportation, and perhaps more, without enhancing present prices here. However, we shall leave all this to the consideration of the growers of wheat in America; and with this information before them, and all else we have furnished, they must judge for themselves, whether best to sell now or hold on for high prices.

When wheat was worth 20 to 30 per cent more than it now is, we advised threshing it out and selling as fast as possible; and we will only add, that this is our opinion still, even at the present reduced rates. Wheat at ruling prices is a very profitable crop; and could it average these a few years, every

good grower in the country could become rich at the business.

It is generally supposed that, both in England and in Ireland, there has been an unusually large breadth of wheat sown the last season; but from some considerations, we have reason to believe the excess in Ireland is far greater than in England. In the former country, there is no regular system of cropping, every farmer being at liberty to sow his land with whatever grain, &c., he thinks most likely to be profitable. Hence, the deficient crop of wheat last year, coupled with the breaking out of the war, giving promise of remunerating, if not high prices, the Irish farmers returned to the cultivation of wheat, which many of them had seriously determined to abandon altogether. It is extremely probable, that at least one-fifth greater breadth of wheat was sown in Ireland last year, than in any one of the ten previous years, there being no covenants of lease to check it.

But with the English farmers generally the case is widely different. A large proportion of these are bound by their leases to a certain routine of crops, any deviation from which, without the special permission of their landlords, would render them liable to an ejection. And, independent of this check, the arrangement of the English and Scotch farms are so rigidly systematic and methodical, that very few of them could with impunity be thrown out of course, for the sake of obtaining an extra profit upon an excess of a given crop. By such a proceeding the farmer would at once disarrange the entire routine of both cropping and grazing, for which any extra profit would be considered a poor remuneration.

It is equally true, however, that this adherence to system was in some measure broken in upon by the excessively wet season of 1852-3, which rendered it impossible to sow the usual quantity of land with wheat. We have, in a former letter of last season, estimated this at one-fifth, to which extent therefore the land was involuntarily thrown out of course. But this would not affect that portion which would come in course for wheat the next season, and it is probable that a part of it at least was sown with wheat last summer, which would swell the aggregate breadth to that extent. What this is, it is impossible to say. Many agriculturists, with whom I have conversed on the subject, are of opinion that the excess is very small, while others represent it as one-sixth above the average. From all that I can gather, I am disposed to think that *on the light and mixed soils there is very little more than usual, because they were less affected by the wet weather; but that on the heavy lands, where it was impossible to sow in the autumn of 1852, a large portion of the land was sown last autumn.* Taking, therefore, these various circumstances into account, I do not think I shall be far beyond the mark in estimating the extra breadth sown in the United Kingdom last season at *one-tenth above the average*, equal to 1,600,000 quarters. On the other hand there is an excess of produce above the average of from one-sixth to one-eighth. Taking the mean of one-seventh, our account of the present crop and stock stands as follows:

	Quarters.
Average produce.....	16,000,000
Excess in breadth one-tenth.....	1,600,000
	17,600,000
Excess of produce one-seventh ..	2,514,285
	20,114,285

If to this we add one million and a-half of foreign grain, we have an aggregate of 21,614,285 quarters to meet the consumption of the year, which is estimated at 21,000,000.

There will still, however, be the usual stock of the country—now minus 5,000,000 quarters—to be made up. For it would be monstrous to suppose that in a country like this there should be no stock on hand, to fall back upon in an emergency. We shall, therefore, require an importation this year of from four to five million quarters, to place us in the average condition we have hitherto found ourselves in, in regard to the stock of wheat.

We shall next take a look round, and see how this supply is to be obtained. As we have just stated, any calculations for the future, founded upon the experience of the past, are not to be depended on. With present appearances, it is not at all likely that we shall obtain the usual supply from the Black Sea ports, even if the Danube is free to navigation, and the Crimea and Odessa were in the possession of the Allies—as I hope will soon be the case. The consumption and waste of such large armaments, and the disarrangement of commerce and agriculture under the iron rule of war, to say nothing of the probable prohibition of the Czar to his subjects from supplying the Allies or conducting commerce with them from the interior—all these circumstances lead me to think that the quantity of wheat we shall obtain from Southern Russia this season will be very small. And with respect to the Danubian Principalities, they have been for twelve months the seat of war, and are still occupied with vast armaments. Under the Russian coercive domination, neither agriculture, nor commerce could be conducted with any regularity; and it is probable that not only was a large portion of the land left unsown last autumn, but that much of the growing crop has been destroyed by the military operations, and in furnishing the Russian cavalry with green food; for no economic considerations would, by any possibility, enter the mind of a Russian officer. We shall therefore have much less grain than usual from the Danubian and other Turkish Black Sea ports, *if we get any at all*, which is very doubtful.

From the Mediterranean ports, with the exception of Egypt and Syria, we shall obtain but little wheat. France and Italy are, for the present, closed against exportation by prohibitory laws. The former country, like the United Kingdom, has exhausted her stocks of old native wheat, and is compelled to fall at once upon the new crop, which, however good, will not be enough both to meet the consumption and provide the usual reserve stock. It is probable that France and England will continue, as last year, to trade mutually with each other in wheat, according as the markets fluctuate. If the price falls here below that in France, the latter will be buyers in our market; and *vice versa*.

With regard to the Baltic and other northern countries, with the exception of Russia, the stocks of old wheat are exhausted. Not only had the merchants the stimulus of high prices to induce them to ship to the utmost, but the insecurity, and uncertainty as to what course the war would take, induced them to export to the last quarter to England and France, as the only countries where it would both be safe, and obtain remunerating prices. The crops in those countries are good, and we shall probably get an average quantity from thence, if no untoward events cause a blockade of the Baltic ports.

We now come to the United States of America; and if the accounts of the maize crop—and wheat also, in some parts of the Union be correct, their prices will probably be too high this season to allow of their shipping more at any rate than the usual quantity this season. It is stated in the American papers that the corn crop (maize)

is at least one-fourth deficient, which amounts to 125,000,000 bushels, or 15,625,000 quarters.* And, with regard to wheat, in some of the Western States, where the largest quantity is raised, the crop is very deficient—in many cases amounting to a total failure. To what extent this may be the case it is impossible to say; but, taking the deficiency in both crops into account, it must necessarily have its effect upon the price; and, unless our prices are higher than theirs, it will materially affect the export of wheat from the States, and also, probably, draw off a considerable portion of the supplies from Canada, where the crop is represented to be excellent.

Under these circumstances, I estimate the supplies for the next year as follows:

	Quarters.
The Northern ports.....	1,750,000
Mediterranean do.	500,000
Black Sea do.	300,000
United States	800,000
Canada	400,000

3,750,000

This may probably be made up to four millions, from quarters that do not come under the sections above given; but I can not, by any possibility, see where we can increase that quantity, unless “a sudden transition from war to peace” should restore our northern trade to its accustomed channels. However, with this quantity added to the abundant crop, we shall be able to reinstate the country in nearly the same condition as to stock that it has usually held; and we need not fear that prices will materially fluctuate throughout the season.

There is abundant reason for grateful reflection in the prosperous condition of all classes throughout the United Kingdom. Although the crop last year was a deficient one, the price was sufficiently remunerative to indemnify the farmer; while on the other hand, every other kind of agricultural produce bore a good price also, where there was no failure, as in meat, cheese, &c.; so that, generally speaking, it was a profitable year for the British farmer. This year, however, there is no question as to the success of agriculture. It is the opinion of many eminent men that we have not had so productive a season for fifty years. Certainly, we have had credible accounts of a produce in wheat, such as we never before heard of. This is undoubtedly to be ascribed to the highly improved system of farming, coupled with the favorable season; and thus a kind Providence has worked with and seconded the efforts of human industry and intelligence to the production of splendid results.

LONDON, Sept. 20, 1854.

S. C.

* The corn (or maize) crop of last year was 500,000,000 bushels.

WHAT WILL MAKE A COW GIVE DOWN HER MILK?—Will you, or some of your correspondents, inform me what will make a cow give down her milk at the time of milking? I have one that has given me much trouble in that respect. At times she can be milked easily, at others it is accomplished with difficulty, and again it is an entire failure. She is a noble cow with that exception.

FRANKLIN, Essex Co., N. Y. THOMAS VREELAND,

WE do not know unless gentle treatment and feeding her with something she much likes while milking will accomplish it. A good subject for some of our correspondents.—Eds.

THE abundance of the mast in this county has brought innumerable and countless myriads of pigeons, which have done more toward raising the price of powder and shot than the Russian war. [Mountain Forest.

MR. KINNAIRD'S SALE OF STOCK.

The sale of Mr. James G. Kinnaird's herd of imported Short-horn cattle, took place at his farm, near Lexington, Ky., lately, in presence of a large assemblage, whom the reputation of the stock had drawn together from various parts of that and adjoining States.

SHEEP.

Four Cotswold bucks were sold, ranging from \$27 50 to \$42 50; nine ewes, from \$15 to \$35. Eight Southdown bucks brought from \$12 to \$50, and seven ewes, from \$9 to \$17. [Kentucky Observer.]

AN EXTRAORDINARY CROP OF WHEAT.—In every county throughout the United Kingdom much has been said in favor of the wheat crops; and in confirmation thereof, a large field of white wheat, grown this year, in the parish of Sessay, near Thirsk, North Riding, of the County of York, is one proof of the bountiful supply Providence has this year been so graciously pleased to bless us with. The field of wheat in question has been the admiration of every beholder thereof. People, rich and poor, from distant villages, who have heard of this splendid field of wheat, have, through curiosity, gone miles to have a look at it. Some of the straws, when standing, exceeded six feet in length, and the average length of the straws in the field would far exceed the average height of a man; and many of the ears were upward of half a foot in length, and well filled, yielding between five and six score full-grown ears. This field of wheat belongs to Mr. Smithson, of the Church Farm, Sessay. The seed was first introduced into the county a couple of years ago, by the agent of Lady Frankland Russell, of Thirkley Park, near Thirsk. [Credit lost.]

GIGANTIC EAR OF OATS.—Yesterday we had handed to us a splendid ear of oats, which was cut in a field belonging to Mr. Cronshaw, of Belthorn, a neighborhood by no means celebrated for its fertility. The ear consisted of 200 grains. If we suppose these grains to be all sown again, and that they would increase in the same ratio for five years, the yield from a single grain would amount to 17,860 tons, estimating 500 grains to weigh an ounce. [Blackburn Standard.]

THE PUMPKIN.

At a late agricultural festival, in New-Bedford, Charles T. Congdon, Esq., delivered a pungent Poem, in which he thus happily eulogises the pumpkin:

O dear New-England! who shall dare dispute Thy well-earned title of the Land of Fruit, When on thy hills yon glowing globe we see— Pumpkin or pompon?—doctors disagree. Lo, where the verdant vines luxuriant run, He turns his fair round belly to the sun! Bathed in those beams he, comatose and calm, The bursting Falstaff of the blooming farm, Awaits his fate—the inevitable hour— The hand that plucks him from his native bower, Only exclaiming, could we hear his cries: "Take me to Bedford, and I'll take the prize!"

O yellow orb! no hand divine is nigh, To snatch thee up and set thee in the sky, A modern star, uncatalogued and new, To fright the saints, and bother science too; But bide thy time!—when chill November falls, A voice shall issue from the State-house walls; And every parson, from his pulpit high, Proclaim aloud Thanksgiving day is nigh. Then, when around the dear domestic board Affection's tide has tremulously poured; When the fond mother—years of absence o'er— Claps to her heart her wandering son once more; When love, refusing longer to be pent, Smiles in the eyes a timorous assent; When laughing childhood, full of fowl and fun, Finds to its wonder that it can not run— 'Tis then, O premium pumpkin! then shall shine In splendor new this excellence of thine. Pie of my country! still upon my breast Midsummer sunbeams in November rest; The magic circle of thy snowy paste Delights the eye and titillates the taste; While through thy form the steel is raging bright, Our aqueous mouths are puckered with delight, And like faint soldiers who from fight would cease, We cry for quarter and demand a piece!

REAPING AND MOWING MACHINES.

(Continued from page 35.)

REAPING machines are either drawn behind the horses, somewhat like a boat on a canal, or pushed before them, after the manner of a wheelbarrow; and the two plans have given rise to considerable controversy as to which is the best. Both have their advantages and disadvantages; hence the grounds for differences of opinion, in the absence of experimental evidence of a more lengthened and satisfactory character than has yet been obtained. True it is, that the former has been in constant operation in America since 1833; and the latter, in this country, for a longer period; but, unfortunately, experience here was never called upon to pronounce judgment upon them until last year, at Gloucester, when she gave her verdict in favor of the "cart before the horses"—a sentence which has this year been reversed at Lincoln; hence the position which we are still in. Under such circumstances, the golden maxim of "Science and practice" obviously demands that we scrutinize the merits of both plans, without the expression of opinionative views on either; and this is just what we shall briefly endeavor to do, and, in order the better to accomplish it, shall, in the first place, take a cursory glance at the whole from the commencement, as we have done with the cutting and gathering apparatus.

The Romans and Gauls, as has already been said, yoked the machine before the horses. The reaper, in this case, was a low cart with shafts, between which an ox was yoked in a reversed position. The cutting apparatus was placed on the top of the "tail-board," and was lowered or elevated by shortening or lengthening the backband which supported the shafts. There being but one ox, and only two wheels, the machine was much more easily controlled than the four-

wheeled reapers of modern times, pushed before two horses.

Pitt, the example from "Walker's Philosophy," Boyce, and Plucknett, followed the Roman plan. The first Scotch example (Gladstone, 1806) is of the opposite kind, the machine being drawn behind the horses, and having two handles, like a plow, for regulating the cutters; and Plucknett's second example (1807) appears on the same plan. Salmon's (the same year) was, according to some, of this mode also, being pushed forward. It might, however, have been drawn from the fore-corner, as Mr. Scott's subsequently was; and this appears to us to be the plan for which the machine was really constructed, if ever intended for horse-power, as it obviously was, although the imperfect description given along with every drawing we have yet seen, states the contrary, thus: "H, handles by which the machine is wheeled," being all that is said on the subject. Now, upon the drawing there are two handles, marked H H, obviously constructed for guiding the machine, on the principle of a helm steering a boat in a canal—a theory current at the time. The description is, therefore, at fault on one point; and consequently, we have some grounds to conclude that the word "wheeled" is a provincialism meaning "guided" or "steered," for it would be absurd to suppose that a man could wheel such a machine before him, or that a horse could be placed between two such handles. Moreover, part of the machine, at the fore-corner, is removed, to show the cutting apparatus; and the appendage for attaching a horse may have also been removed, and the description of it omitted, as the descriptive references are, as we have seen, apparently hurriedly written. But whether it was drawn by the right-hand fore-corner or not, it may, with the assistance of the handles for steering, have been so, giving to it an entirely new feature, which otherwise it would not have possessed, involving principles susceptible of being easily improved upon; for, by giving a reverse motion to the crank of the gathering apparatus, and placing a hook or ring for attaching the horses to the opposite corner, in returning, we have an automaton machine capable of cutting in both directions, or from one side of the field, without interval, to the other, like the old Roman.

The first Scotch example having failed, the next, in the north, is Mr. Kerr's (in 1811), pushed before the horses, analogous to Mr. Harkes' at Lincoln. Contemporaneous with Kerr, we have Smith of Deanston, on the same principle. In 1815, Mr. Scott took the opposite plan, as already referred to; and in the same year, Mr. Gladstone brought out his improvements of his first machine, still adhering to the same mode of yoking his team. In 1820, Mr. Mann followed on the same side, introducing a front wheel behind the horses. Subsequently, he was advised to adopt the Roman plan; but the proposition did not meet with his own approbation, still less the trial, so that he afterwards returned to his original design. In 1822, Mr. Ogle yoked the horses before the machine; and in 1826, Mr. Bell placed them behind it. It is rather singular to see the schoolmaster and clergyman thus opposed to each other, as it were, on the mode of draught, and their descendants—Dray's and Crosskill's machines—contending in the field for the prize at Lincoln! Whether from the comparative success of Bell's, and the influence of Mr. Smith, of Deanston, who advocated putting the machine before the horses, we will not say; but, in the north, opinion was generally in favor of this plan at this period; and it appears to have extended as far south as Lincolnshire, where Gibson's came out on this plan, in 1846. Indeed, throughout the kingdom, it was generally advocated until

the arrival of the Americans, when the old Scotch plan revived, and, judging from Lincoln, bids fair to leave its opponent behind, or at least bring it fairly to the bar of experience.

In America we find a similar state of things, both plans of yoking the horses having been adopted; but there, the tide of invention appears to have been more in favor of the Scotch mode of draught than the Roman. It has been so in this country, as our readers will perceive, but not to the same extent; and this arises from our northern neighbors themselves having thrown aside their own plan, and adopted that of "putting the cart before the horses," as previously attempted by Boyce and Plucknett, in this neighborhood.

In each of these two modes of yoking there is a considerable diversity of contrivance, independently of that which distinguishes the one from the other, deserving of a passing notice, from the principles they involve, many of them suggesting further improvement. There is, for instance, a wide difference between the mode in which Crosskill yoked his horses at Lincoln, and that pursued by our forefathers in the days of the Romans, when we were at this season harvesting our corn—either shipping it directly from the field to Rome, or else for being put into Roman granaries, for early export next year. At that time, the object of the British farmer was to secure the earliest and best samples for export, reserving the inferior quality for his own use. Indeed, he was then more dependent upon his flocks and herds, with the produce of hunting, than bread-corn; and hence, the worse work in the harvest-field, the fatter mutton and bacon afterward, so that his rude reaping machine, and his mode of yoking and working it, harmonized with his interest. A single ox in the shafts was all that was necessary; and he was soon trained to guide the machine, and keep pace with his driver attending to the cutting apparatus. But, rude as such machines and mode of yoking them were, they yet furnish information; for a two-wheeled machine is much more easily driven straight forward in the direction of the corn to be cut, than one on three or four wheels, as any one may experience who wheels before him a two-wheeled truck or barrow, and a four-wheeled one; or the same is illustrated in backing a (two-wheeled) cart and a (four-wheeled) wagon; and when we add cutting and gathering apparatus, which act adversely and irregularly to the advancing motion of the machine, as we soon shall see involved in some of our modern improvements, the task becomes more difficult, and still more so when two horses are yoked abreast, each in shafts, as was done when first tried, because then their action was also irregular—hence the next improvement, of a pole and whipletrees. But even these were found insufficient to overcome the above difficulties; so that machines then ran into the standing corn, and otherwise were ungovernable, like Harkes' at Lincoln, until a steering apparatus was attached to the point of the pole, enabling the driver to counteract the adverse motion or agency in question.

(To be continued.)

TO MAKE CORN STARCH.—The ripe grain must be mashed and ground to a fine meal, and then placed in a glazed mortar, and rubbed and triturated with a small quantity of water, until all the cornaceous particles are broken down. It is then to be transferred to a fine linen filter, washed, and expressed with successive portions of water. The liquid that passes through, must be allowed to stand for sixteen or twenty hours, for the sediment or starch to subside. The water

is then to be drawn off and the residue dried in the usual manner.

This is the simplest and cheapest mode yet known for preparing the corn starch for puddings and other useful applications.

[Albany Cultivator.]

FOOT-ROT IN SHEEP.

FLOCKMASTERS in Germany separate the diseases incidental to the foot of the sheep into two kinds—infectious and non-infectious; or better, into the virulent and the mild foot-rot; for although the common foot-rot is there considered by some as non-infectious, it is perhaps only comparatively so, being attended with little or no danger, and often disappearing without the application of a remedy, although through neglect it may degenerate into the virulent or infectious state. The following remarks relate, I think, to the disease alluded to by Mr. Watkins, and which he supposes to have been introduced into England of late years; in Germany, they trace its origin in that country to the introduction of the Merino sheep. It first shows itself in the limping gait of the animal, which gradually increases; generally commencing with one of the fore-feet, afterward both are affected, and at last this lameness extends to the hinder feet, with increasing bodily weakness.

The diseased foot is hot, and is often swollen round the hoof, which is more open or wider apart than on the sound foot, and the skin of the coronet is inflamed. An unpleasant smelling humor exudes, which thickens on exposure to the atmosphere, and not only inflames and destroys the immediately surrounding skin, but often penetrates between the horn of the hoof and the foot itself, the horny part partially separating from the flesh; and in the worst cases an entire separation of the hoof takes place, and, if neglected, destroying the muscles and sinews, and attacking even the bones of the feet; in which condition the poor animal moves about on its knees, or helplessly lies down, the whole system gradually becomes poisoned, and although generally with unimpaired appetite, it wastes away until death releases it from suffering.

The worst form of this disease is not so often met with in the coarser Merino flocks, as in those where every care is taken in improving the fineness and quality of wool, by which means they are rendered more susceptible to the changes of temperature and weather. It is of a very infectious nature, if proper precaution be not taken, spreading through an entire flock in a month or two, and is often introduced by merely driving sound sheep over land where diseased sheep have been a short time previously.

Precaution is the oldest and best remedy; but thorough cleanliness, wholesome food, and attention to the flock in wet and inclement weather, will not always keep the disease away, as long as there are so many channels for introducing it; should it exist in the neighborhood, the shepherd must keep a vigilant eye on his flock; a sheep observed to be lame must be immediately examined. If a small eruption or pimple appears on the skin between the hoofs (coronet), and the foot is unnaturally hot, the disease has made its appearance, and no time must be lost in applying a remedy; the diseased sheep must be kept by itself, and all the flock very carefully examined.

With a sheep knife remove the seab or pimple, clean out the wound to the sound flesh, wash it with salt and water, and then do it over with strong nitric acid. If the disease has advanced under the horn of the hoof, all the unsound flesh, together with the horn, must be carefully removed, the wound washed out with brine, and strong nitric acid applied; some recommend using

sulphate of copper instead of brine, and butter of antimony in the place of nitric acid; but with the brine and acid a cure is generally effected in eight or nine days. Another remedy is, a concentrated solution of chloride of calcium dissolved in water; after the feet are well washed and cleaned, and all diseased parts removed, they are carefully painted over with the chloride, as far as the ankle-joint, using a small painter's brush for the purpose; and it is best to apply it also to those which have only heat in their feet. It is a safe and good remedy.

An old German shepherd recommends a composition consisting of several ingredients; but a method of destroying the virus of the disease by electro-chemical action, and the preservative effect of water, deserve investigation. The process is simple, and is said by those who have tried it to answer completely; but, having never seen it applied, I must not trespass further on your valuable space, and am, sir, your most obedient servant,

JOHN P. RUBIE.

SOUTHAMPTON, Sept. 28.

[Mark Lane Ex.]

SOLIDIFIED MILK.

THE last number of the *American Medical Monthly* contains an account of a visit made by a committee of medical gentlemen, appointed by the New-York Academy of Medicine, to the establishment of Mr. Blatchford, at Armenia, some thirty miles east of Poughkeepsie, where solidified milk is prepared. The editor describes the process of solidification as follows:

To 112 lbs. of milk, 28 lbs. of Stuart's white sugar were added, and a trivial proportion of bi-carbonate of soda, a teaspoonful, merely enough to insure the neutralizing of any acidity, which in the summer season is exhibited even a few minutes after milking, although inappreciable to the organs of taste. The sweet milk was poured into evaporating pans of enameled iron, imbedded in warm water heated by steam. A thermometer was immersed in each of these water baths, that, by frequent inspection, the temperature might not rise above the point which years of experience have shown advisable.

To facilitate the evaporation, by means of blowers and other ingenious apparatus, a current of air is established between the covers of the pans, and the solidifying milk. Connected with the steam engine is an arrangement for stirrers, for agitating the milk slightly while evaporating, and so gently as not to churn it. In about three hours the milk and sugar assumed a pasty consistency, and delighted the palates of all present. By constant manipulating and warming, it was reduced to a rich, creamy-looking powder; then exposed to the air to cool, weighed into parcels of a pound each, and by a press, with the force of a ton or two, made to assume the compact form of a tablet, (the size of a small brick,) in which shape, covered with tin foil, it is presented to the public.

Some of the solidified milk which had been grated and dissolved in water the evening previous, was found covered with a rich cream. This, skimmed off, was soon converted into excellent butter. Another solution was speedily converted into wine whey, by a treatment precisely similar to that employed in using ordinary milk. It fully equalled the expectations of all, so that solidified milk will hereafter rank among the necessary appendages, of the sick room. In fine, this article makes paps, eustards, puddings and cakes, equal to the best milk; and obtained from well pastured cattle, and not the produce of distillery slops; neither can it be watered.

For our steam-ships, our packets, for those

traveling by land or by sea, for hotel purposes, or use in private families, for young or old, we recommend it cordially, as a substitute for fresh milk.

We look with interest for the scientific report of the committee of the Academy of Medicine, in which we hope for an exposition of the domestic, culinary, and hygienic properties of solidified milk.

SUMAC—OSIERS.

I was brought up to the woolen business in Western Massachusetts, and have not only cut and cured but used tuns of sumac as an ingredient for dying. The only reason why American sumac is inferior to the imported article is that *old growths* are used. If it is cut every year and nothing but the new growth saved, it is doubtless equal to that which comes from abroad. Foreigners, who make it an article of commerce, cut, cure and sell the growth of each year, so that it is full of coloring matter. We used to cut over our grove each year, and thus keeping it down, the sprouts were abundant and of the first quality. Sumac generally grows in rocky, worthless land, and, if managed properly, will yield more value in sumac than it could be made to produce in any other crop with the addition of careful and expensive culture. The rocky dells and worthless hill-sides of Hampden and Berkshire Counties in Massachusetts, yield, or if properly kept down *would* yield, all the sumac that the entire State would use with all her morocco and cloth manufacture; and it could be cut and cured by berry-picking school-boys. I did it before I was old enough to be of any service in working a ship to import it. But nine-tenths of the rural population, whose children industriously pick blackberries and whortleberries to buy straw hats and school-books, are not aware that sumac is of any earthly use, and would gladly avail themselves of its profit if informed.

It should be cut just before frost comes and cured like corn-stalks, and when dry, cut by means of a straw-cutting machine, leaves, sticks and all, and put into stacks for market, or it might be ground fine in a bark mill. If cut close to the ground, several sprouts will grow, four feet high, from the stump in a season. This is the sumac of commerce.

In respect to the osiers or willow for baskets, I desire to say, everybody knows that willows are as abundant of growth, and are regarded as much of a nuisance around water-courses as sumac is in hill pastures. Why import that which costs us so much tireless labor to destroy? Why not save it with the same labor that it now costs to destroy it?

There is a German in this city living within a stone's throw of my store, who hires the farmers in the neighboring counties to cut and bundle up their willows for him and sink them in the brook until he wants them. In April, May and June he and all his children down to four-year olds, are busily engaged in stripping the bark and preparing a stock for their year's work. But does it pay? The farmers are doubtless satisfied with the compensation he gives, for they bring him cartloads, and smile over the gold he gives them in exchange for otherwise worthless "willow sticks." But does it pay the German to make them up into baskets? He landed in Philadelphia fifteen years ago with only five dollars in his pocket; he has reared nine children, done no other business but make willow baskets, and is worth to-day the house he lives and works in, and has *twenty thousand dollars* in the Savings Bank. It seems to pay. I have often thought, as I have seen this family stripping their willow twigs and carting away (at a cost) loads of the tough bark, why it might not be used for

the manufacture of paper. I am confident it would pay—surely it would be very valuable as an article of manure.

[New-York Tribune.]

NEW SYSTEM OF PRESERVING MEAT.

If fresh meat could be had from distant countries, where it bears a very low price, the people of France would be able to purchase a much larger quantity of animal food; but this has been hitherto impossible, for the cost of transport and of fattening would be such as to make the meat dearer than that which is raised in France. Attempts have been made to preserve meats in the cheap countries, and export them to France, but they have all failed. There is now a project before the Emperor and the Minister of War for the drying of meat in South America, where it can be had at about one sou per pound, and importing it from thence for the use of the army and navy. We have seen some specimens of meat dried in Paris, and which at the expiration of five months were perfectly fresh and good. In South America a very large quantity of meat is dried in the sun, but the process carries away a very large portion of the nutritious properties, and it remains good only for a few weeks. The process on which the government has now to give a decision is simple and apparently efficacious. The water of the meat, which forms a very large portion of its bulk, is removed; and not by heated air, which has been frequently tried, and never with success, but by mechanical means; the meat is then plunged into a sort of varnish made from the gelatinous portions of the animal, and which not only forms a hard surface, but also enters into the pores of the meat and augments the nutrition, and then the meat is gradually dried. In about fifteen days it is fit for packing, and will, according to the assertion of the inventors, keep good for two or three years. When required for use, the meat is put for a few minutes into water, and it nearly resumes its original bulk, and is cooked in the usual way. If it be true that meat thus prepared will keep for two or three years, or even for one year, the adoption of the process will produce an enormous change in the economy of subsistence. In South America it can be prepared at about two sous per lb. including every cost. As it is reduced in bulk about one-half, the cost to transport would not exceed one sou, and it could be sold in France, with a profit of 25 per cent, at four sous per lb. South American meat is not, perhaps, equal in quality to that raised in France, but even supposing it to be inferior to the extent of 20 per cent, the working-classes and the poor would have an abundant supply of animal food.

[Galignani.]

THE GIPSY'S HEN.

A FEW evenings ago I sallied forth to enjoy a stroll along the green lanes and fields after my daily toil. The evening was delightful, and so was the music from the birds in the trees and hedges. It was equally delightful to see the children gamboling along in wild glee and gathering the bashful buttercups and the starry daisies, until, to quote Eliza Cook, "wearied with prattle, they loitered home, in twos and threes, laden with their flowery spoils, to lie and dream all night of worlds made of flowers." Continuing my walk amid a most delightful perfume from the flowers of the thorn, the bean-fields and the clover, and enjoying the beauty of the scene around, with the setting sun's golden light thrown upon the buds just breaking "into emerald greenness," I came upon a gypsy's encampment. A heap of faggots was blazing on the ground, and over it was

suspended the kettle. The gypsies were some of them engaged in preparing the evening meal, while the children were gathered around their father, who was amusing them by playing some well-known airs upon his violin.

"Down by yon hazel copse, at evening, blazed
The gipsies faggot—there we stood and gazed.
Gazed on her sun-burnt face with silent awe,
Her tattered mantle, and her hood of straw.
Her moving lips, her caldron brimming o'er;
The drowsy brood that on her back she bore,
Imps, in the barn with mousing owlet bred.
From rifled roost at nightly revel fed."

RODGERS.

I entered into conversation with them, and examined the camp, when I discovered, in one corner of a cart, a hen sitting upon a seat of eggs, and some of her chickens were hatched. On inquiry, I found that, though they frequently traveled many miles during the setting period, they had generally good luck with their hatches. The fowls were healthy, and supplied the gypsies with abundance of eggs, owing, doubtless, to their *extensive pasturage*, and the multitude of insects found in the shady lanes. My visit to the camp afforded me another proof of the retentive vitality in eggs, and satisfied me that some gypsies are courteous—cleanly in their tents, and poultry *producers* as well as *consumers*, and therefore they do not *always* have recourse to the neighboring roosts for their revels.—C. P., Boston.

[Poultry Chronicle.]

MAKING BREAD.

THE Rhode-Island Society for the promotion of Industry gave the first premium on domestic bread to Mrs. Hiram Hill, of Providence. The following is Mrs. Hill's recipe for making the bread exhibited by her:

For two loaves of the ordinary size, take two potatoes, pare them, slice very thin, and boil quick until quite soft, then mash to a fine pulp, and add, little by little, two quarts of boiling water, stirring until a starch is formed; let it cool, and then add one-third of a cup of yeast. This forms a sponge, which should remain in a moderately warm place for ten or twelve hours, or over night, until it becomes very light and frothy, even if a little sour, it is of no consequence. When the sponge is ready, add flour, and work it until you have formed a stiff, firm mass. The longer and more firmly this is kneaded, the better the bread.

Let the kneaded mass remain, say from a half to three-quarters of an hour, to rise, then divide into pans, where it should remain, say fifteen minutes, care being taken that it does not rise too much and crack; then put the loaves into a quick oven and bake, say three quarters of an hour. If the oven is not hot enough, the bread will rise and crack; if too hot, the surface will harden too rapidly and confine the loaf.

MINCE PIES.—Boil three pounds of lean beef till tender, and when cold chop it fine. Chop three pounds of clear beef suet, and mix the meat, sprinkling in a table spoonful of salt. Pare, core and chop fine six pounds of good apples; stone four pounds of raisins and chop them; wash and dry two pounds of currants; and mix them all with the meat. Season with a spoonful of powdered cinnamon, a powdered nutmeg, a little mace, and a few cloves, pounded, and one pound of brown sugar; add a quart of Madeira wine and half a pound of citron cut into small bits. This mixture put down in a jar and closely covered will keep several weeks. It makes a rich pie for Thanksgiving and Christmas.

[Maine Farmer.]

AN Eminent Painter was once asked what he mixed his color with, in order to produce so extraordinary an effect, "I mix them with brains, sir!" was his answer.

Horticultural Department.

THE NEW-YORK HORTICULTURAL SOCIETY.

THIS Society met on Monday, October 16, 1854, for a conversational meeting—Mr. Groshon in the chair, and Mr. Mead, secretary. Subject: "*The best mode of constructing and heating green-houses.*"

Mr. Mead remarked, in substance, that it unfortunately happened that the planning and erection of green-houses generally fall into the hands of architects, who have no practical, or even theoretical, knowledge of the uses to which these structures are to be applied; and the result is, that very few good *growing* houses are erected. The architect seeks to make a showy house, and, for this purpose, plants and every thing else are thrown into the shade, by a redundancy of mere ornament; but a green-house is beautiful just in as far as it will grow plants well; in fact, its beauty consists almost entirely in its utility. A green-house can not be made too light and airy; but, with us, the angle of the roof should not be such as to collect too many of the sun's calorific rays. A pitch that would be proper for the dense, humid atmosphere of England, would be improper for the clear, transparent atmosphere of the United States. Natural laws are applicable to the structures of this kind—which Mr. M. proceeded to explain, and added some remarks in regard to the materials of green-houses. He seemed to think that glass and iron, for *permanent* structures, not only the best, but, in the end, the cheapest. He then passed to the second branch of the subject—the best mode of *heating* green-houses. He thought a hot-water apparatus, on the whole, decidedly the best. For promptness, efficiency, and genial heat, steam must be admitted superior to hot water; but steam is dangerous in inexperienced hands, and should only be used in large structures, and where an engineer can be employed. The hot-air flue is fast losing its advocates. It is uncertain and inconstant in its operation; is liable to burst; emits noxious gases, &c.; and, in many other respects, is objectionable, and is only fit for a temporary house. A good hot-water apparatus, on the contrary, is efficient; gives out a uniform, constant, and genial heat; is free from gas and dust; economical and easily managed, and, in many other particulars, most admirably adapted to the purpose. Notwithstanding, the whole subject of heating is still in its infancy. There is a large waste of heat and material, which should not be tolerated.

Allusion was then made to a case, where the same boiler was made to heat a conservatory, green-house, and propagating bed, and answered the purpose well; but it was deemed best, in such cases, to have separate boilers, where the houses were of any magnitude.

Mr. Wm. Cranston, and others, concurred in the above views.

Mr. Cranston instanced a case, in Scotland, where sufficient hot-water pipe had not been laid. To supply the deficient heat, the smoke-flue was carried under the back

shelves, and accomplished the purpose. This was deemed a good plan to economise heat, provided the smoke-flue was made perfectly tight.

It was then proposed, as the subject was not exhausted, to continue it at the meeting to be held on the first Monday in November.

On the tables were some blooms of several varieties of new and fine dahlias, presented by Mr. Mead; and also the Sheldon pear, from the original tree, presented by Messrs. A. J. McClave & Co., nurserymen of Marion, Wayne Co., N. Y., through Mr. Pardee. It is a good-sized green pear, slightly russeted; and, the committee reported, the "flesh juicy, melting, sugary, and highly perfumed. Quality—*BEST.*" It was in perfect condition.

HOVEY'S MAGAZINE FOR OCTOBER.

THE reputation of this excellent horticultural monthly is sustained by the varied contents for this month. It opens with an article on *Our neglected American Trees*. The writer thinks that it is a great mistake, in making a plantation, to consider only the character of the Summer foliage of the trees. The season of its budding out, the autumnal tints of the foliage, and the character of the branches and spray in winter, are all matters of importance, in making our selection. He then indicates six trees of admirable ornamental qualities, that are too much overlooked. The first of these is the Tupelo tree, (*Nyssa multiflora*), commonly known in Connecticut as the Peppercorn tree. It is a very common tree on the upper part of our island; and fine specimens of it may be seen along the line of the Harlem Railroad, in the vicinity of Wilmsbridge. The foliage is broadly oval, alternate on the growing shoots, but in tufts of four or more, on the end of the lateral branchlets, of a brilliant glossy green above, reflecting the light like those of a camellia. It turns from its deep green to a rich scarlet and crimson in the Autumn, at which season the trees are usually covered with bright blue fruit, rendering them the most conspicuous objects. We passed one of these trees in a ride yesterday, in the full glow of its dying foliage. Its colors rivalled any of the maples, while its leaves are more tenacious of their hold upon the spray, and prolong their glory as the maples do not. It forms a beautiful feature in the landscape, both in Summer and in Autumn. The other five are the *Nettle tree*, *Sweet Gum*, *Deciduous Cypress*, *Flowering Dogwood*, and *Judas Tree*.

WILSON FLAGG has an interesting article on *Clouds*, marked by his characteristic excellencies. It is exceedingly artistic, philosophical, and beautiful. Mr. Flagg is one of our best writers upon topics usually treated in horticultural journals; and his articles alone are worth the subscription-price of this magazine.

The third article is a description of *thirty-three new foreign pears*, by the Editor. The Adams, Tea, Muskingum, Harvard, Wilkinson, and Abbott, are each figured and briefly described.

In the Pomological Gossip, the Editor goes

in for the Concord grape with his usual enthusiasm. Not at all disturbed by the adverse opinions of his horticultural brethren, he pronounces this grape the most attractive feature of the late exhibition of the Massachusetts Horticultural Society. All who were present at that show, would hardly coincide in that opinion. We saw the grape there, and at our own State Fair in this city, and, at the last place, had the opportunity to taste it. It is unquestionably a great improvement upon the wild grape, ripens early, and has large handsome bunches. We have no doubt it is an acquisition for people who can not raise the Dianas and Isabellas. On these grounds, we think its merits should rest, rather than on a comparison with the Isabella. We think almost every one, who has eaten Underhill's Isabellas, and Bull's Concord, would say that the Concord was inferior. But see our article at length on this subject, in another column.

The next article is a notice of a large Isabella vine, in the garden of G. B. Cutter, Weston, Mass., by W. W. Wheildon; and seems to have been written for the purpose of puffing the *Concord*, at the expense of the *Isabella*. It seems they were compared at the late exhibition in Boston. Mr. Cutter's grapes were splendid samples of the Isabella, and yet the Concord was superior! We think the statement made in this article, that the Concord grape "is universally admitted to be equal to the best Isabellas ever raised," is somewhat too strongly expressed. We certainly heard other opinions expressed at the Pomological Convention, by gentlemen not ruled by cliques, and not to be suspected of any sinister motives in uttering this judgment.

There is a favorable notice of J. F. ALLEN'S new hybrid grape—a seedling of the Isabella impregnated with the foreign grape. It is a white grape, similar in appearance to the Sweetwater, and nearly or quite as good as that old sort. It is thought that it will prove hardy, and be an acquisition.

In the directions for horticultural operations for this month, the opinion is expressed that Fall is the best time to set out fruit trees. The ground should be trenched or subsoiled as soon possible, while in a dry and friable condition. As soon as the leaves will shake from the trees, transplanting may be commenced.

TREATMENT OF SCARLET FEVER.—Dr. Hereford, of Washington, in a communication which appears in the *Alexandria Gazette*, expresses the opinion that too much physic has been an error in the management of scarlatina. He says that, during thirty years' practice, he has found that the less active medicine he used, the greater was his success in the treatment of this disease. He recommends opening the bowels regularly every day, with some mild aperient medicine, such as castor oil, senna, &c., and keeping the patient at rest and comfortably warm. Sponge the surface with tepid water two or three times a day; while it is hotter than natural, admit fresh air. Live on bland diet, such as a cupfull of arrowroot, two or three times a day, and toast-water for common drink; borax may be used from the commencement, if the throat is affected.

Fig. 1.

Fig. 2.

CROSS' PATENT GRAPE FRAME.

ABOVE we present cuts to illustrate a simple and convenient arrangement for trailing grape vines upon a movable frame, in such a manner as to admit of changing the position of the vines at pleasure. Fig. 2, gives an end-view of the frame, and shows at once the method of bending the vine upon the ground, and how it may be elevated to a perpendicular or to any desired angle. Fig. 1, shows two such frames placed upon each side of an upright supporting shaft. In the frame A, we see the fruit exposed to the sun. Through an error in making the cut, we see the fruit on the upper side of A, instead of the under side, as it should be. The fruit should be represented upon the upper or right hand side of B.

Mr. Cross claims several advantages for this kind of frame, among which are the following: The fruit can, by this means, be grown near the soil, and then be raised up to the sun. He recommends that the vines be left in the position indicated by C, Fig. 2, until the grapes get their growth, "because the ground is shaded; the rose bng is not as injurious; the fruit is not as liable to mildew; it is not so exposed to blasting winds; it sets in greater abundance; and the grapes being protected and warmed by nearness to the ground, grow larger and faster and mature earlier."

We think that at least part of the advantages are secured; one or two of them are doubtful, and we invite discussion upon them. During the recent State Show, we examined a model, exhibited by Mr. Cross,

and were so well pleased with it that we procured the above engraving for our readers. This method of grape raising was patented by Mr. S. Oscar Cross, of Sandy Hill, Washington County, N. Y., on the 27th of June, of the present year, and we refer to him all those who may wish to make further inquiries.

FORCING BULBS, AS HYACINTHS, ETC.

BY A LONDON AMATEUR FLORIST.

FOR many years it has been a favorite object with me to have a fine bloom of forced bulbs, such as hyacinths, &c., both in glasses and pots, and now, the season for commencing operations having arrived, induces me to note down a few particulars which I have practised; and, as to the result, have never failed to have a most brilliant display of these lovely flowers, affording me their varied beauties and fragrance, as additional charms to domestic comforts, at a season of the year which often precludes similar out-door enjoyments.

HYACINTHS IN GLASSES.

In selecting bulbs, take the plump and firm ones, the more globular the better, being the most perfect.

The bulbs should be placed in dark colored glasses, filling them no higher with water than about an inch from the bulb, wrap the glass and bulb closely round with a piece of old flannel; they must then be put in a moderately warm closet, or other dark place, for two or three weeks, by which time they

will have emitted roots, and should be removed to an airy, light, and cool situation, till about Christmas, when they may be brought into the warm sitting-room, and placed near the windows. The attention to placing them in the dark, arises from the fact that, where light has free access, leaves will immediately be produced, as it is congenial to their nature; but it is the opposite with roots, and where full light exists, they will not push forward. Kept in the dark, roots push freely, and having obtained them first, leaves and flowers will certainly follow.

When they are removed to a light situation, the glasses may be filled up to the tips of the roots, and in a week afterwards up to the bulb. Rain or river water is to be preferred, and should be changed every two or three weeks, the fresh water being applied about the same temperature as that removed. Should the water in either of the glasses become foul sooner than the others, the roots and the under part of the bulb will generally be found covered with decayed substance, which should be removed, and the whole plant washed. Should off-sets appear around the bulb they should be removed early. As soon as the Hyacinths are overblown, the blossoms should be stripped off, without destroying the leaves or stem, and the plant laid in the earth until June, when they may be taken out and laid upon shelves or boxes, in an airy situation, until October, when, though not fit for blooming a second season in water, they will produce fine blossoms in the open ground, and by thus saving annually the bulbs which have been forced, and their numerous off-sets, a beautiful Hyacinth bed, of every shade and color, may be obtained, which is one of the most pleasing objects in the months of April and May. I repeat that the errors too often observable in growing Hyacinths in water are: placing them in the full light when first planted, which is very unfavorable to the growth of the roots; keeping them away from the light when throwing up the leaves and blossoms, which prevents their coming to their natural colors; placing them (before the leaves and stems are sufficiently advanced) upon a chimney-piece or other very warm place, which spends too much of the bulb in fibrous roots, and forces up the blossoms before they arrive at their proper size, form or color.

Hyacinths, Narcissuses, Jonquils, Tulips, Persian Irises, and other bulbs for early blooming in pots, (without any hot-beds or green-houses,) should be planted early in September, for which purpose deep-shaped flower pots should be procured, called bulb pots, placing crocks or coarse gravel at bottom for drainage, and be filled to within two inches of the top with rich loam, containing a portion of fine road sand and decayed manure; and then place the bulb on the same, without pressure in so doing, and fill to the top with the same compost, after which a little pressure should be used, which will settle the bulb and mould firmly together, with the top of the bulb just above the surface of the soil.

When the desired number of roots have been thus potted, they should be removed to any spare corner of the garden, and buried to the top of the pots in the earth, when they must be covered with leaves, rotten tanner's bark, or any other light dry substance to the depth of nine or ten inches, where they remain without any attention until the plants will be found to have vegetated an inch or two; they should then be removed, and placed in any warm and light situation, where they will make rapid progress, and produce blossoms far superior to those obtained by other modes of treatment.

American Agriculturist.

New-York, Wednesday, Oct. 25.

WHAT IS THOROUGH BRED?

CASTINE, Darke Co., Ohio, Sept. 26, 1854.

As I am a new hand in breeding stock, I am interrogated often what constitutes *thorough bred stock*. I know that thorough bred means through and through. As to the number of crossings that constitute it, I am not positive—some say *seven* crosses make it. Now, as you are residing in a county where the breeders should be well posted, I wish you would give me information on the subject, being an old hand at breeding stock.

H. T. WOLLARD.

We should define animals as thorough bred which breed true—that is, invariably produce offspring possessing the same distinguishing characteristics as themselves. This is the case with the race horse, which is claimed to be of pure desert Arabian blood, on sire and dam's side, imported into England, and bred there, the history of which may be found in the English Stud Book.

Southdown, Long Wool, and Merino sheep are what we should call thorough bred; for they invariably produce young with the same distinguishing characteristics as the parents, and have done so for ages.

There are certain breeds of cattle which appear to be thorough bred, like the Devon, the black Galloway, the wild cattle of Chillingworth Park, and other races, in Europe, Asia, &c.

We presume our correspondent more particularly refers to Short Horn or Durham cattle, which are not what we should call thorough bred, a few tribes, perhaps, excepted. These we do not like to name now, because many breeders would feel as if the exceptions were invidious; and such is the want of proper knowledge, both in England and America upon this subject, we doubt whether our doing so would result in anything better than stirring up a hornet's nest about our ears.

When the first meetings were called among the breeders of Short Horns in England, for the purpose of getting up a Herd Book, it was proposed and agreed to by the most distinguished breeders, that such cattle only should go into this Herd Book, as were known to have long possessed Short Horn characteristics in an eminent degree; and that their progeny alone should be considered thorough bred. But this was afterwards overruled by other parties who possessed inferior blood; and the result was, that all sorts of grade Short Horns have continued to be inserted in every volume of the Herd Book; so that it is of little value as a guide, except to those who know what these choice tribes were, and how they have since been bred. An animal may have a pedigree a page long in the Herd Book, and still, owing to some of the strains in it being bad blood, it may not be near so good as one with scarce any Herd Book pedigree at all. This long experienced breeders know to their cost, to be a serious fact.

Seven crosses are not *thorough bred*, nor many times *seven*; though the first may

pass for tolerably well bred in certain kinds of animals. This may sound like over refinement to some; but let us respectfully ask, if they should cross a Devon bull on a black, hornless cow, and this progeny again with a pure Devon, and so on, how many generations think you would it take to wipe out the stain of the black blood? Let him answer this who can.

SELECTING, PACKING, AND SHIPPING APPLES TO EUROPE.

A friend in Plymouth, Mass., addresses a series of questions to us on this subject, which we answer to the best of our ability below. We shall be obliged by further information on this subject from any of our more experienced readers.

KINDS OF APPLES PREFERRED IN ENGLAND.

The Newtown Pippin is preferred above all others, because it is the highest flavored, most juicy, and has been found by long experience to keep best. It is the only apple we know whose flavor improves by crossing the Atlantic. An American friend informs us, that in passing through Marseilles, in the south of France, as late as the month of March, one year, he noticed some Newtown Pippins for sale, which had found their way there from New-York *via* Liverpool. He had the curiosity to purchase some, for which he paid fifteen cents each. They were perfectly sound, and more delicious than any he had ever tasted this side of the water. He is quite an amateur in fruit.

Apples with a deep blush, or entirely red, or red-streaked, find most favor with the English eye; and would unquestionably be preferred to the Newtown Pippin, if as highly flavored after crossing the Atlantic, and they kept as well. The Baldwin, Esopus Spitzenburg, Tompkins County King, Lady Apple, Detroit, and Canada Red, are highly esteemed; and, if carefully picked and shipped, keep well. The Rhode-Island Greening, Roxbury Russet, and Swaar, though great favorites at home, have not usually paid well for shipping. We recollect taking a few of these three kinds to sea with us twice, for our own personal eating on board ship. In a fortnight they had lost all their agreeable taste, and a few days after rotted so badly we had to throw them overboard. We deem it fair to say, however, that others inform us they have been more fortunate with these three varieties; still we consider them rather uncertain for shipping.

PICKING.

This should be done in cool, dry weather, and very carefully by hand, placing those of nearly an equal size in barrels, as fast as picked; then carefully head and transport to ship, either on a sled or spring-cart, so as to avoid the possibility of their being bruised. The barrels must not be rolled on any account.

Mr. Pill transports them in baskets on a sled, from the orchard to the second floor of a cool, well ventilated house, built on purpose for the business. Here they are carefully placed in heaps, where they sweat a few days, and are then wiped and packed. Others contend that this previous sweating

is unnecessary, and that after being packed they will sweat over again, just as much as if taken fresh from the trees and packed; and that the latter bear transportation across the Atlantic, and keep just as well in Europe as the former. If so, it has the advantage of saving a good deal of labor. Pack those only of good size, and smooth fair skin.

BEST TIME FOR SHIPPING, EXPENSES, ETC.

From the 1st to the 15th of November, in 40° of North latitude, is the best time; South or North of this, later or earlier, according to the latitude. On deck is of course the best place to stow them. Under deck they do not keep well. The more the barrels are exposed to the atmosphere, and the dashing of the salt water over them on the voyage, the better; but to bear this, the barrels must be nearly as tight and good as those in which flour is packed. Bore three or four quarter-inch holes in each barrel-head, for air and escape of moisture.

Steamers are better than sail ships for transportation, on account of their being quicker and more certain in their voyages. On board the former, be careful to stow them in such a manner as not to be heated by the smoke-pipes or steam.

Sail vessels usually charge from 30 to 50 cents per barrel for freight, steamers four times as much. Shippers of choice apples prefer paying the difference in freight and send by steamer. Commission on sales and other charges in England, are about \$1 per barrel. They sell from \$3 to \$15; the average price of choice, arrived in the best condition, is from \$8 to \$12 the barrel; so it will be seen that it is important to ship the choicest fruit only, and in such a manner as to insure its arriving in fine order.

HOUSES TO WHOM TO SHIP.

Several European Express companies can be recommended. But any good, honest commission house would undoubtedly do the shipper full justice. If the captain of the ship be a competent man, and is willing to attend to it, he would be the best person to take the consignment, as he would then sell directly to the hucksters, and save to the shippers most of the intermediate charges of the commission merchant. The captains of steamers and packet ships, however, have no time while in port to attend to such matters. They usually have something of more consequence to look after then, than selling apples. The fruit-trade requires considerable experience and judgment in managing; any one who takes it up at hap-hazard, as a mere speculation, would be likely to lose money by it.

As fruit is a perishable article, it is usual to demand freight in advance, at least by sail packets.

A SOUTH DOWN STATUETTE.—Messrs. Morris and Becar, have sent us a plaster cast of the statue of their famous Southdown buck *Young York*, which they imported last year from Mr. Webb. Having often seen the original, we can assure our readers that he is one of the best Southdowns that ever stood on four legs. His owners have a fine lot of lambs from him out of Webb ewes, also imported by them.

THE CONCORD GRAPE.

It will be recollected, by those familiar with our pages, that, at page 37 of our last volume, we made some remarks in relation to this newly introduced fruit, questioning somewhat its vaunted equality to the Isabella and Catawba in flavor; and suggesting that the trial of another season should be given, before the public receive it with perfect confidence, in all the good qualities claimed by its propagators. The season has now passed; and we had the gratification of testing the fruit for ourselves, at the Show of the State Agricultural Society, recently held in this city. Mr. Hovey, of Boston, the selling agent for the Concord grape, had several fine grown bunches on exhibition, among the fruits in the Pomological department, which we examined, and we are free to give our opinion of its merits as we found them.

In appearance, it has a well-developed, large-shouldered bunch, well filled with full, roundish, oval berries, with a fine bloom, like the Isabella, and of about equal size to that fruit. This we call great praise, thus far. Its flavor is good, sweet, with a slightly vicious, Catawba flavor, and a dash of the foxy taste of its parent. (It originated from the seed of a good New-England Fox grape, crossed, probably, by the pollen of a Catawba, near which it grew.) The pulp is soft, and not objectionable. On the whole, an excellent grape. Its great merit, however, and that which will give it precedence over other native grapes for out-of-door culture in the northern States, is its early ripening, which is said to be two or three weeks before the Isabella, and quite four weeks before the Catawba; for neither of these will ripen uniformly, and with certainty, above latitude 42° North. Grape growers above that degree, have hitherto had no really good variety on which they could rely, for neither the Clinton nor Diana can be called truly fine grapes. Here, then, is one presented to them, which, if we are right in our premises, is to supply the desideratum.

A word as to the flavor of the Concord, in comparison with the Isabella and Catawba. It has been claimed to be equal to either of these delicious fruits. But we think that is claiming a little too much. These fruits, although of quite different and distinct flavor, are peerless in their kind, as native grapes. The Concord lacks the luscious sweetness of the one, and the delicious champagne aroma of the other, which nothing short of the long, continuous sunny Summer of their own climate will give them. Yet it is rich and sweet; and those who can not mature either of the others, may be well content that so good a fruit as this is at last offered to their cultivation. It may, indeed, be quite possible that, when the Concord shall have obtained greater age, or be grown on more mature vines; or farther south, its flavor may improve to an equality with either of the others. It is a strong, rapid grower, with hardy wood, and we see no difficulty in cultivating it in the garden of every farmer north and east of Pennsylvania. We wish the Concord grape every possible success;

but we still opine that the asking-price, of five dollars for a single plant, is above the mark; and that, in the long run, its owners will be quite as well compensated, in its increased sale, at a dollar or two for a plant. Many would pay this price cheerfully, while they will never purchase it at so exorbitant a sum as the other. At a dollar, five men would send for a plant each, while at five dollars they will not touch it at all; or they will club the five dollars and send for a single vine, preferring to wait a year or two till they can multiply it for themselves, by layers or cuttings.

FINE APPLES.—We have received of Mr. J. C. Hastings of Clinton, this State, a basket of apples of the following choice varieties: Sweet Belle et Bonne, tart Belle et Bonne, Jonathan, Pound Sweet, English Fall Pearmaine, a small sweet apple without a name, St. Lawrence, Fameuse, Tallman Sweet, and Swaar.

These apples are among the best grown and fairest specimens of the kind we have yet seen, and of very fine flavor. The Belle et Bonnes, both tart and sweet, are rare apples in this market, and superior kinds. The English Fall Pearmaine is truly magnificent.

Mr. Hastings, we understand, has a large and choice nursery, and we suppose he can supply trees of the above, and most other kinds of fruit grown in the northern States.

MY MADEIRA VINE.

BY ANNA HOPE.

It is our Indian Summer. Frost has come, and commenced his work of spoliation; but he has been driven back, for a time, to the cold regions of the North, where he delights evermore to dwell, and where he is so fortified in his fastnesses that Summer scarce dares venture to show her smiling face, or to dispense the rich treasures which it is her pleasure to scatter over the earth. Her excursions into that forbidding territory are often short, but they fill the earth with gladness. The Frost King must cherish some spirit of revenge, and wish to retaliate upon the fair domains of Summer, or else he is fond of traveling, and would fain explore other regions than those peculiarly his own. Wherever he goes he carries the same cold heart, and breathes the same destroying breath over the fair work which it has been the delight of Summer to bring forward and perfect. The flowers have disappeared, except a few hardy plants which, for a short time longer, will cheer us with their charms, and then they, too, must pass away.

As I sit at my open window, enjoying the balmy air, and thinking how soon it will give place to chilly frosts, a most delightful odor greets my senses, and I, for a moment, wonder what it is that can be so fragrant and June-like. I drop my work, and draw closer to the casement. It is the Madeira vine, which I planted in the Spring, and which has climbed up over the bay-window, and is now covered with its delicate white blossoms. How well it repays me for the care it has received! Its incense-offering is most ac-

ceptable. When I planted it in the earth it was a mere tuber, destitute of beauty; but the rains of Spring watered it, and the sun warmed it, till it sent forth its shoots, and gracefully twined itself around the cedar-support at whose foot it had been deposited. It has wound its way up, up, till its odorous flowers hang luxuriantly from the top of the cedar, and cast forth their delicate perfume on the Autumn air.

During the Summer the living green of the succulent leaf has gratified my eyes, and has added a new beauty to my vine-embowered cottage. Soon Frost will invade the warm neighborhood in which it has thrived; the flowers will drop, and the leaves wither and decay; but my Madeira vine has hidden a treasure for me in the earth. If I look for it, I shall find a cluster of tubers—no more beautiful than their parent, but each whispers to me a promise of future growth and development, if I will preserve them from the enemy whose power they have not strength to resist. I listen to the tiny voice, for their mother told me the same story last Fall, and she has faithfully kept her word. I can not doubt her children. I shall carefully remove them to my cellar, where no frost can touch them, and in the Spring I shall commit them to the earth, and they will reward me for my care, by their cooling shade and most delicious perfume.

I wish all my young friends knew the beauty which a few climbing plants would throw around their homes. I should like to give them some tubers of my Madeira vine; but as I can not, I can only recommend them to get, next Spring, a few from some gardener, and train them over their windows, or around the pillars of their porch. It would make their houses so attractive and cheerful, that they would love home more than ever; and, when they grow old and gray-haired, memory will fondly return to the days of youth, and linger around the old homestead, made more lovely by their own hands.

FLAX IN INDIA.

It seems that a good deal of flax has been grown, for years past, in the Punjab, for the oil alone. Now that the war adds greatly to the expense of importation from Russia, it is proposed to grow it extensively, for the lint, in India. We hope our own farmers will keep an eye to this business; for, should Europe continue at war another year or so, a profitable market will be found there, not only for flax, but hemp. The western country is capable of growing almost unlimited quantities of both of these staple articles.

A GOOD CROP FOR A SMALL FARM.—The Montreal *Herald* gives the following as the crop of sixty-three acres, at Bowmansville, Canada East:

	Bushels.		Bushels.
Wheat.....	1,300	Potatoes.....	1,000
Peas.....	200	Carrots.....	3,000
Oats.....	250	Turnips.....	2,500
Barley.....	300		
Total.....	2,050		8,500

Beside other small matters, Spring wheat yielded forty bushels per acre.

Scrap-Book.

"A little humor now and then,
Is relished by the best of men."

WORDS OVER A GRAVE.

Did she suffer long? Oh, yes! and 'tis best
To wipe our tears when such weary ones rest;
Fond hearts watched o'er her for many a day,
Lest life's torn petals should fall to their clay;
But they fell to their clay.

Did she sorrow to live? When her husband was
There lay 'neath her eyelid an unshed tear; [near,
But it trickled not till her boy drew nigh
And asked his pale mother never to die!
Never to die.

Did mind flit from her, with death afar?
And left it the gate of the grave ajar!
While tenantless life, outlined as before,
Was the shadow of mind thro' that open door?
Through that open door!

No! praise to Jehovah! for mercy thus shown,
The light and its shadow at once were withdrawn,
Yet she trimmed her Faith ere she went away;
God grant there was oil in the lamp that day—
In the lamp that day.

The funeral train, like a gulf-stream, wound
Thro' the ocean of life that was heaving around;
In silence it moved as the wreck they bore,
Where the grave-stones pebble the church-yard
The church-yard shore. [shore-

We lingered long by that cold grave side,
While back to the world swept the funeral tide,
Far from the death-beach it ebbed away,
Nor missed from its bosom a drop of spray—
A drop of spray.

And must dust absorb it? Ah, no! if she shone
Among Christ's jewels—a precious stone—
When judgment shall open the grave's rough shell,
She may be a *pearl*—but we can not tell—
We can not tell.

HUSKING CORN.

THERE are different methods of harvesting and curing corn in different parts of the country. In the large corn-growing districts at the West, and South, where the stalks often attain the height of twelve or fourteen feet, and look at a distance like fields of sugar cane, the corn is allowed to stand in the field till December or January. The husks have then been opened by the winter frost and the golden ears hanging upon the stalks are a beautiful sight. The farmer then passes through the field with his horses and a large wagon and picks the ears, leaving the husks and stalks standing as they grew. The writer has seen immense fields of corn in Illinois, so tall that men standing on the ground could not reach the ears, and would be obliged to stand upon the wagon to gather them.

In the New-England States corn does not grow as large, and is harvested in a different way. In many instances the stalks are cut off above the ear, and carefully cured. This process exposes the ripening ear to the sun, and hastens its maturity. In the month of October, when the ears are fully ripe, the corn is cut up with a sickle, and gathered into a large heap previous to husking.

The season of corn husking in New-England, has formerly been, like the time of sheep-shearing in Nantucket, a merry making. Who that was familiar with farming scenes a quarter of a century ago, does not remember the merry moonlight evenings of October, when around a huge pile of corn, the labor of husking became a pastime to the assembled group of neighbors? Then the old and young mingled their joyous mirth and beguiled the rapid hours with song and story. We may safely affirm that no sumptuous feast was ever relished better than the

simple pumpkin-pie and sweet-cider did then, and, perhaps, no moon-light evenings have been brighter or happier than when the bashful youth escorted home his favorite partner in the rustic dance, and since then may be the partner of his life.

Of late years corn husking is less a season of merry-making. It is usually performed by the family, and not unfrequently employs all its available members, and is made a cheerful labor.

Let us listen to a dialogue, of a family thus employed—the widow Wilkins and her three children, Tom, Dick, and Lucy. The good woman is giving a lesson to Dick how to strip off the husks—and little Lucy is trying to do as Dick does.

Mother.—"See there, Dick—do you see that?"

Dick.—"Yes, ma'am."

Mother.—"Well—you take off the husks, and hold the stalk, just so."

Dick.—"Yes, ma'am."

Mother.—"And then you break off the stalk close to the ear, just so."

Dick.—"Yes, ma'am."

Lucy.—"There, mother! didn't I do that better'n Dick?"

Mother.—"Yes, my darling. Now, Dick, do you know how to do it?"

Dick.—"Yes, ma'am."

Being satisfied that the husking was in a fair way, the widow Wilkins departed, and left her children to themselves. After she was gone, Dick spoke as follows:

"Can you tell me, Tom, what all this corn is for?"

"To be sure I can," said Tom; "some of it is to feed the chickens with; some of it is to feed the pigs with; some of it is to feed the horse and cow with, and some of it is to be ground into Indian meal to make johnny-cake and brown bread with."

"Well done!" says Dick. "It seems to me that the corn is very useful then; for the chickens and the pigs, and the cow and the horse, and mother, and Tom, and Dick, and Lucy, all live upon it. Really I never thought of that before. Then people when they plant and plow, and hoe and pick, and husk the corn, are working all the while for the hens and hogs and cattle and people?"

"Yes, to be sure," said Tom; and what did you think all this labor was for before you found out it was useful in this way?"

"Why," said the boy, "I thought—I thought—I don't know what I thought; I guess I didn't think at all—or, if I did, I thought it was all a kind of play. But I know better now; I see that when people at work, they are not playing, but they are doing something useful; and when mother sets me to work, I mean always to consider that she has a good and useful object in view, and that I must do it; not because it is play, but because it will do good."

"Very well," said Tom, "I hope you will always do so." By this time the husking was done and I came away. [Merry's Museum.

MRS. PARTINGTON INDIGNANT.—"The printing press is a great steam-engine," said Mrs. Partington, "but I don't believe Dr. Franklin ever invented it to commit outrages on a poor female woman like me. It makes me say everything, Mrs. Sled; and some of the things I know must have been said when I was out, for I can't remember 'em," said she, dropping three stitches in the excitement. "They ought to think," continued she, "that them who make sport of the aged don't never live to grow up!"

HOORAR!—The following jubilant dispatch recently passed over the wires between Albany and a neighboring city: "To Mr. —, —street, Albany. Dear Jem—Another boy. Hoorar!"

A SUFFOLK TALE.

I ONCE took notes of the legends of old country houses, and the best I can remember, lingers about an old Queen Anne mansion in Suffolk. There are terraces paved with lozenges of black and white stones before the house, and two bay trees, of great height and great age, keep guard before the flight of steps that lead by to the last; and there is always a dry rustle in the evergreen leaves, whether the wind be up or not, that startles one like the rustle of brocaded silks, along a corridor. A strange old dial is over the door, with the date of one of Marlborough's battles upon it. Many an eye has been turned to it, to read the lesson that it still teaches; for it is an old schoolmaster that outlives many scholars. But the story, the story: In the beginning of George II.'s time, there lived here a country gentleman and his young wife. He was of the Squire Weston race, and neglected his wife for the covert side, the river's bank, and the fox-hunter's debauch. She fell in love with an officer, who was staying at the house; his pity for her grew into love, and love became a sin. Her husband, thrown from his horse, came in one day earlier than was expected, and found his wife with her lover. In his rage he struck her; and drawing his sword, advanced against the officer, but, bruised by his previous fall, fell, and was stabbed to the heart by his adversary. Packing up her jewels and some *rouleaux* of her husband's, the guilty woman fled with the murderer, whose hands were still red with the blood of him she once had loved. She left her only child, a girl of exquisite beauty, then about eight years of age. The fugitive was not heard of for ten years. The daughter had grown up into womanhood and beauty, and was on the eve of marriage with a young farmer in the neighborhood, for the estate had fallen into decay during the minority, and he had become her equal in wealth, if not in birth. It was a November evening, starless, moonless, cheerless. If you looked out through the misty windows of the old hall into the woods, you could hear no sounds but the fog drops, drip, drip, dripping, pattering on dead leaves, or splashing in the rain-pools. A dense blue fog, steamed up from the dark woods. By the old hall fire sat the maiden and her lover, when a muffled sound, as of wheels on turf, sounding at a distance, grew nearer and nearer, as if they were coming swiftly up the green-covered drive to the hall. They looked out, and saw a black coach, with black plumes upon its four corners, approaching, the wheels were muffled with black—the horses were black—the coachman wore a mask, as did the two men who swung behind; and before the windows were drawn curtains of black. My heart bleeds while I tell this sequel. It was the proud mother's unnatural greeting of her daughter. On the door being opened, the masked men rushed in, seized the maiden, and carried her into the coach, and on the lover resisting, stabbed him, and left him in his blood. The doors were closed, and the coach drove off ere a rescue could be effected. No traces of the mother or daughter could ever be found; but there is reason to suppose that both died in a convent near Namur. The house fell into other hands, and but for the preservation of the old picture gallery, I should never have learned the tragical story. [New Monthly Mag.

THE OLDEST INHABITANT.—The Warrenton (Va.) *Whig* says: Easter, a negro woman, the property of Mrs. Eliza F. Carter, near Upperville, in Fauquier County, died on the 17th July, having attained the age of 140 years! This is one of the most remarkable cases of longevity on record.

LOUIS NAPOLEON'S LOVE OF HORSE FLESH.

THE Emperor's splendid stud of horses excited the admiration of the Prince's suite, and is not unworthy of notice in connection with the Emperor's well-directed efforts to improve the breed of horses in France. The cavalry horses of the French army are mostly bred in Normandy, except the horses of the light cavalry, which come from Tarbes, near the Pyrenees, and which have a mixture of Arab blood. With many excellent qualities of endurance, the horses of the French cavalry are capable of great improvement in point of blood and bone, and Napoleon's attention is unceasingly directed to this object. Large purchases of English horses are frequently made by his agents, and, seeing the prices which are given for good steeds; and the rivalry which exists between the buyers of the French and German Governments to secure the best animals, some astonishment is expressed that English farmers do not more generally avail themselves of the facilities they possess for rearing first-rate horses for so certain and so good a market. Besides the *haras* of the Emperor, he has a stud and breeding establishment at St. Cloud, at which colts of extraordinary value are reared from a mixture of English and Arab blood.

The Imperial stables at Boulogne, which are in close proximity to the Hotel Brighton, the Emperor's residence, are an *extempore* construction of wood, erected in fifteen days, but extremely convenient and well arranged, and covering nearly half an acre of ground. They contain thirty-six English saddle-horses for the use of the Emperor, his suite, and visitors; thirty-six carriage horses for the Emperor's caleches, char-a-bancs, and other vehicles, and thirty post-horses. The Emperor's chargers, reserved for his exclusive use at reviews and in the field, are six in number. They are all English, as are, indeed, the greater part of the carriage-horses, and as their former names are retained, and every stall has the horse's name painted over the animal's head, the English visitor might forget that he was in a foreign country, and imagine that he was walking through the stables of some English nobleman. The Emperor's favorite steed is a dark chestnut horse, called Philips, after Mr. Philips, of Knightsbridge, of whom the Emperor purchased him. He is a noble and spirited animal, and is usually ridden by the Emperor when he reviews the troops, where he distinguishes himself by his beautiful action and by his habit of bowing and prancing when he approaches the colors of a regiment. (What an invaluable circus horse he would be!) As the Emperor at the same moment raises his hat, the horse and the rider appear to salute the colors together, to the great delight of the troops. Both the Emperor's stud and establishment at St. Cloud, and that at Bologne, are under the superintendence of the *premier piqueur* of his Majesty, Mr. Gamble, whose thorough knowledge of the points and treatment of the animals under his care is well known to the English sporting world. The general control of the stud is confided by the Emperor to Colonel Fleury, *Premier Ecuyer* to His Majesty. In the saddle-room are seen two gorgeous saddles and bridles, presented to the Emperor by the Sultan, the saddle-cloths of which are most richly embroidered with gold, all the mountings being of solid gold, and the bit of silver gilt. One of these saddles, &c., was used by the Emperor when riding out with the Prince Consort. Its value is estimated at 250,000 francs. Another splendid saddle, with crimson velvet seat, was presented from Abd-el-Kader, with three Arab horses. The Imperial carriages and liveries are of dark green; the former

are all manufactured in Paris. Few things grieved Louis Napoleon more than to be obliged, when President, to break up his stud and dispose of his horses; but now that exalted position supplies him with the requisite sources, he loses no occasion of obtaining the best English horses that money can procure. [English Paper.]

INTERESTING TO BUILDERS AND OTHERS.

A new and important method in the manufacture of bricks has just been patented at Washington, which is destined to effect an important reduction in the cost of erecting buildings in which this material is used, and now-a-days there is no building where brick does not form a component part. By this new method, introduced by Baron de Palm, to whom the patent has been granted, houses can be built of sound, solid brick walls, at a price, we are informed, not exceeding that of an ordinary frail wooden tenement. This fact, then, considered in relation to the extraordinary high rates now paid, and occasioned in a great measure by the prices of building materials, is a consideration of no ordinary magnitude. When the kilns or furnaces are put in operation for the manufacture of bricks under this process, it will doubtless attract the attention of practical men, and effect a great change in the cost of buildings of every description.

The peculiarity in the making of bricks under this patent consists in the construction of the kiln. The arrangement is novel, consisting of partitions and sub-divisions in the kiln, where the baking is carried on, and by a series of registers the heat is conveyed from one compartment to another without any waste. There is little or no loss of unbaked, over-burnt, or vitrified bricks, and a surprising saving of fuel. The cost of fuel and of the waste of material and labor under the old system more than doubles, or probably more than quadruples, the cost of bricks when pronounced ready for market in the old kiln. The fuel question now engrosses largely public attention, and vast quantities of pine, hickory, and other woods now consumed in the burning of bricks, will, under this patented mode, be economized to the extent of two-thirds of the present consumption. It therefore is a subject of interest and importance both as to public and private economy.

Beside the making of bricks, the kilns can be used for the baking and hardening of all kinds of pottery; that will cheapen in a large degree manufactures of that description. The patentee, we are told, has secured his patent rights in England, France, Belgium, Holland and Germany, besides the United States. Several eminent architects in London and Paris have testified to the importance and value of the patent, and several well known brick makers at Washington have given highly favorable certificates of the usefulness of the new kiln. Among those who have examined the patent with the view to test its scientific results, is Professor Chas. T. Jackson, of Boston, who says: "I am of opinion that this new kiln is a valuable improvement, adapted to the thorough and efficient baking of bricks and pottery. I am also of opinion that the kiln is admirably adapted for the baking of ornamental brick work, hollow bricks, and drain pipes, such as can not be baked in ordinary open kilns." [Maine Farmer.]

WHAT RAILROADS DO.—A Georgia contemporary who has just paid a visit to Alabama, reports "four hundred houses now in course of erection," many of them of a fine city like style. Ten years ago Atlanta was in the woods; it now contains a population not far from ten thousand. The assessment of

city property just completed, shows the amount of real estate, taxable in the city, to be \$1,800,000. This is an increase of \$737,553 over the amount of real estate returned for 1853. The whole amount of taxable property, real and personal, for the present year amounts to \$2,800,000, being an increase of \$775,000 over last year. Of the real estate in the city, that which is not taxable, being made up principally of church property and railroad lots and buildings, amounts to \$115,000.

VERMONT—A MODEL STATE.—Firstly, there is not a public, legalized tipping house in the State. Instead of licensing men to sell poison to their fellow men the sale of rum is made by law what it always is in fact, a crime.

Secondly, there are neither cities nor soldiers, nor a fort in the State, though the citizens when called upon are the best soldiers in the world. Who has not heard of "Molly Starks" men of the Revolution; or the "Green Mountain boys" of later date?

There is not a theater, circus, opera-house, museum, or any other show shop in the State, and who ever heard of a Vermont mob? Without "fighting rum," how could they have mobs? There is no record of a Vermont murder these ten years, and her penitentiary is a small one.

There are no slaves in the State, nor any, except a few dough faces, who fellowship with slave owners. There are railroads, but no Wall streets or State streets, and no great railroad defaulters.

There are no seaports, no arrivals of immigrants, except a few scattering from Canada, and hence no monstrous corruptions at the ballot box.

There are no Banks that do not pay what they promise, and no millions spent at the State Treasury to support an army of idle loafers.

There is in Vermont a nation of hardy mountaineers; athletic men and handsome women; a great community of honest, industrious farmers, cultivating a fruitful soil, and enjoying the rewards of peaceful industry. [N. Y. Tribune.]

ENGLISH AND GEORGIAN WOMEN.—Crossing a substantial Russian bridge of wood, stretched over a mixture of half swamp and half stream, we reached a little Georgian village, where we were evidently looked upon as wonderful specimens of natural history by the inhabitants. The houses are composed of wattle-work or wood, and consist of three or four rooms on the ground floor, the principal room being lined with sofas, upon which (when seen by us unawares) the residents were reclining. I never saw so many women to a household as in this place—about half-a-dozen to each—and generally exceedingly pleasing and pretty in appearance, and graceful in their walk. At first sight of us they generally adhered to the Turkish custom, and, covering up their faces ran away to an inner room, or closed the door while we passed by; but soon curiosity prevailed, their doors opened a little, and then whole figures came gradually to view, until at length they came out in a body and unveiled, and boldly criticized the appearance of the "Ingleez;" they were attired in colored or pure white drapery, drawn in at the waist, and setting off their figures and fair complexions to advantage. The men wear a calpac and robe supplied with cartridges, like the Circassians, and are generally fine, intelligent-looking fellows.

TO GET RID OF BED BUGS.—Wash the bedstead and rope with hard brown soap, and put some soap in the holes with the rope, and the varmints will not like such quarters.

REVIEW OF THE BRITISH CORN TRADE.

THE harvest is now concluded, even in the most backward parts of the kingdom. With the exception of that small proportion carried early in August, previous to the setting in of the fine weather, the whole has been secured in admirable order. We have lately heard that some of the Lincolnshire and Cambridge-shire farmers find, on threshing their wheat, that the yield is not so large as had been expected would have proved the case. This, we think is not improbable as more mischief was done there by the heavy rains in July and August than in almost any other district. Large breadths were beaten down, and but for the splendid weather which succeeded, the injury would have been very extensive. Hot sunshine and drying breezes remedied the evil to a great extent; but where the straw was broken, the ear, being deprived of nourishment, ripened prematurely, and the berry is, therefore, in many instances, meager and shriveled. Notwithstanding this disadvantage, we are inclined to think that the crop of wheat in the fens has given over an average quantity; and in other parts of the country there is certainly a considerable excess. Taking the produce of the whole kingdom, we are disposed to estimate the yield at about one-fourth over an average. Whether, however, we are to have low prices during the next twelve months, may be questioned. One good crop is not sufficient to make good the exhaustion of stocks, in consequence of the deficiency in the harvest of 1853; indeed, we have heard it seriously argued, that the country is not in a much better position as regards stocks now, than it was at this period last year. This proposition we do not feel inclined to agree to, but it is certain that very little wheat remained in farmers' hands at harvest time, and that it was necessary to commence the new almost as soon as it was secured. The quantity of old foreign wheat in the kingdom was small; for though the London warehouses were well filled, there was comparatively little at any of the outports. This being the position of affairs, we do not consider that the late rally in prices has been without cause; but present rates are tempting to the growers, and we should certainly not be surprised to see materially increased deliveries from the farmers. Many who were not inclined to sell at 50s. will feel well satisfied to realize a portion of their wheat at 60s. per qr., or even somewhat less. Thus far, farmers have been too busily engaged in the fields to have much time for threshing; but, in the course of another week or two, sowing will have been accomplished, and we shall then, in all probability, have good supplies. The wheat trade has maintained a firm tone, and at several of the leading provincial markets held since Monday, rather enhanced terms have been obtained. At the markets in the agricultural districts, the quantity brought forward has about kept pace with the demand, and the prices have undergone little alteration. Of spring corn the deliveries have been on a very scanty scale; and barley and oats have risen in value in the farmers' markets as well as at the leading consuming towns.

We have for some time past heard comparatively little about the potato. That part of the crop has been lost in consequence of disease, can not be questioned; but they appear to keep better this year when dug than in some former seasons, and the quality is certainly much superior to what it has been of late years.

Within the last few days, a new subject of uneasiness has arisen; reports having reached us, in respect to turnips, of a very unfavorable character. Whether this disorder is general, we are not prepared to say;

but in some districts the plant is blighted or diseased to such an extent as to have given rise to the belief that the crop will prove a failure. Should this unfortunately be the case, all articles suitable for feeding would of course rise in value.

[Mark Lane Express.]

WHAT CAN BE DONE IN A GARDEN.

A correspondent of the *New-England Farmer* says: Thirty years ago I purchased an establishment consisting of a dwelling-house, barn, carriage and wood-house, calculating to make it a permanent residence. There was attached a little land for a garden, on which were just five apple trees, and in front of the house were three trees of the balm of Gilead; the trees were all about six inches in diameter at that time, but two of the apple trees were hollow, and I cut one of them down, after trying to make it do something and finding I could not.

Well, all the apple trees bore something for fruit, but so crabbed and sour they would make a pig squeal. At this time I was engaged as a trader, and had a country store to look after, which occupied about all my time; but, as time went on, and stage-coaches and railroad cars succeeded one another, I had more time; for I can now travel as far in four hours as I could then in two entire days with my team. Well, for amusement, I grafted all the four apple trees gradually, or year by year, cutting off the old branches and grafting the limbs with Roxbury russets, New-York russets, Baldwins, &c., &c., all the best kinds I could find. Now for results: I have had about ten barrels of good apples, annually, to put up for winter, for three or four years past, beside all we used in the family of five, and we have used them freely all we wanted, till time to gather the winter apples.

I have a yard in front of my house, about forty feet square, in front of which are two of the balm of Gilead trees before mentioned, which are now large trees, and have been left outside of the front fence: but inside of the fence I set out, about ten years ago, three pear trees, of the common summer pear, which now give us all the pears we want, for they have borne well for about four years. From the pear trees to the house, I filled the space with flower-beds, and have had many varieties, say twenty kinds, of roses, and nearly one hundred kinds of flowers; I have planted on the south side of my buildings, next to the passage to the barn, plums, peaches, and grapes. The peaches have not succeeded well, nor the plums, so I cut the plum trees off, and grafted them with the green and purple gage, only three or four years ago, and now I have plenty of the finest plums I ever saw, so that I have had to prop the small branches. My grapes began to bear last year; I had about a bushel, and I should think I might get double the quantity this year. I have set out some quince trees, but they do not bear yet.

Beside the tree and grape vines, I have annually raised about ten or fifteen bushels of potatoes, six or seven bushels of beets and carrots, some English turnips and rutabagas, and a few cabbages and onions, as many as our folks wanted to use. We have also had beans, peas, and corn, what we wanted to use green, and I have annually had about three or four bushels of dry corn, say two bushels common yellow corn, one bushel of pop-corn, and sweet corn enough to plant myself and supply all my neighbors. Also, I have annually raised cucumbers, water and muskmelons, summer and winter squashes, one or two hundred or one thousand pounds of pumpkins. All this has been raised on less than half an acre of ground, including buildings and drive way, and I

have had more vegetables for years in my family, than some men that cultivate one hundred acres, and all on poor, gravelly New-Hampshire land, without any help but my girls in the flower department. And as Goldsmith says, "We make every rood of ground support its man."

YOUR PAPER DID NOT COME, SIR.

THE uncertain arrival, or uncertain delivery of papers at country post offices is often the ground of complaint against publishers and editors. Many of the offices are poorly supplied with conveniences for taking care of papers, no matter with what certainty they arrive.

The papers are jumbled into a few little pigeon holes or piled upon a desk, box or barrel, to await the call of subscribers, in the midst of boots, hats, bridles, horse collars, and other coarse wares, which may be called for during the day by customers. Country post-masters, in most cases, being engaged in some mercantile business, many newspapers find their way into some obscure corner, where they are hid for a time from human eyes, as completely as if buried in a mountain cave.

In comes the man for his paper, and, as it can not be found, of course it did not come. The indignant subscriber consequently abuses the rascally editor, and perhaps calls for pen, ink and paper, to write a letter of complaint about not sending his paper punctually, when, if the said paper were endowed with speech, it would cry out, "Here I am, squeezed to death behind this box, or under this barrel."

We have seen just such things at many country post offices, elsewhere, as well as in this country. These remarks have no reference to any particular office, but are meant for all where they will apply.

[The Advance.]

THE WHEAT CROP IN ENGLAND.—In a private letter just received from JOHN B. LAWES, dated Rothamsted, Sept. 13, he says: "We have just gathered in a splendid harvest, all over great Britain, and you may expect prices to rule very low in England next year. One acre, which I set apart to ascertain the produce of my farm, yielded 53 bushels, and I think my whole wheat crop will average from 45 to 48 bushels per acre. The experimental crops have not been threshed, but they are very fine, and I think the produce in Broadback* will be higher than it has ever been before."

[Rural New-Yorker.]

* Broadback is the name of the experimental wheat field. The fields in England are all designated by name, and if we mistake not Broadback is destined to hold a place in agricultural history. A crop of wheat is taken from it every year, the different plots being dressed with various fertilizing substances of known composition. The crop just harvested, and which Mr. LAWES thinks will be the best it has yet produced, is the eleventh.—Eds.

A FINE ORCHARD.—Moore's *New-Yorker* gives an account of the orchards of Austin Penney, Clarkson, Monroe Co., N. Y., who has for several years past devoted himself to the collection and planting of fine fruit, and more particularly of peaches, for the best varieties of which he has ransacked the whole United States. The editor of the *New-Yorker* states that he has 28 acres occupied with fruit-trees, of which there are 3,000 peach trees, and 2,700 dwarf pears. Most of them have been set out about three years. They are stated to be exceedingly thrifty and healthy, many of this year's shoots being four to five feet long. The land was subsoiled before planting, and heavily manured with a compost of yard manure and muck. The soil is kept mellow by cultivation, but no annual crop is admitted, except an occasional crop of beans, in the peach

orchard. No wonder these orchards should be so widely celebrated for their thriftiness, with such treatment as this.

SINGULAR CASE OF INSTINCT IN A HORSE.

WE do not remember ever to have heard of a more remarkable exhibition of equine intelligence, than was communicated to us a few days since by Mr. Allen of this place. The circumstances, as they were narrated to us, are as follows:

Mr. Allen had, for a considerable time, a span of sprightly little horses, that he had never separated. In the stable, in the field, and in harness, they have always been together. This has caused a strong attachment to grow up between them. A few days ago he went out with them to Lake Minnetooka, on a fishing excursion. Taking them out of the carriage, he led them to the lake and tied them, several rods apart, on a strip of grass that grew upon the shore, and left them to feed. Returning to the shantee, he threw himself upon the floor, to await the return of the party who had repaired to the lake to fish. Not much time had elapsed before the sound of approaching horses' feet attracted his attention, and a moment after one of his horses appeared at the door. The animal put his head in, and giving one neigh, returned at a slow gallop, yet under evident excitement, to the spot where but a few moments before he and his companion had been seemingly safely fastened. Surprised to find his horse loose, and struck with his singular conduct, Mr. Allen immediately followed, and found the other lying in the water entangled in the rope, and struggling to keep his head from being submerged. While Mr. Allen proceeded to disengage the unfortunate horse, his noble benefactor stood by, manifesting the utmost solicitude and sympathy, and when his mate was extricated from his situation, and again upon his feet upon *terra firma*, the generous creature exhibited the most unquestionable signs of satisfaction and joy. That this intelligent animal should have noticed the unfortunate situation of his mate—that he should know where to apply for rescue, and in his efforts should sunder a three-fourths of an inch rope, and finally that he should exhibit so high an appreciation of the event, are curious circumstances to us, and commend themselves to the thoughtful consideration of those who would limit the power of reasoning to the "genus homo."

[St. Anthony's Express.

A BRAVE GIRL.—The *Martha's Vineyard Gazette* tells the following: We learn that an impudent fellow of a beggar went into a house at Holme's Hole, a few evenings since where there was but one person—a young lady—and expressed a desire to stop over night. The young lady informed him that he could not stop there, when he deliberately seated himself, and informed her that he would, and should stay there all night. The young woman then went to a bureau in the room, and took therefrom a pistol, put a cap upon the same, and deliberately aimed it at the fellow's head, ordering him to decamp at once, or suffer the consequences. The beggar took to his feet, and made tracks at once. As he passed out, the lady snapped the pistol at him; but as it was not loaded, the fellow got off with a whole skin.

KEEN.—A country schoolmaster, happening to be reading of the curious skin of an elephant—"Did you ever see an elephant's skin?" he asked. "I have!" shouted a little "six-year-old," at the foot of the class. "Where?" he asked quite amused at the boy's earnestness. "On the elephant," said he, with a most provoking grin.

MAKING TALK.—A farmer's daughter in this State was visited by a rustic youngster, who finding it difficult to keep up the conversation, asked the girl, after an embarrassing silence had prevailed for some time, "if she knew of anybody that wanted to buy a shirt?" "No, I don't," she replied: "have you one to sell?"

"Oh, no," said he, "I only asked to make talk."

Markets.

REMARKS.—Flour of the Common brands is the same as per our last. Choice brands, are 25 to 50 cts. higher. Corn, no change. Nothing else worth noting, except in Wool, which is firmer. Cotton is $\frac{1}{4}$ of a ct. per lb. better. Rice is a trifle lower. Sugar the same, Tobacco no change.

The weather has been very fine for all fall operations.

PRODUCE MARKET.

SATURDAY, October 21, 1854.

The prices given in our reports from week to week, are the average wholesale prices obtained by producers, and not those at which produce is sold from the market. The variations in prices refer chiefly to the quality of the articles.

THE Market to-day holds about the same as last week, bating a slight depression in the lighter kinds of vegetables. Good potatoes vary but little, though inferior kinds have a slight upward tendency. The market is plentifully supplied with cabbage.

Of fruits there is a good supply. Apples are not quite as high as last week. Grapes are mostly out of season. Cranberries, no change.

Butter has advanced a little—about 1c. Φ lb., and eggs 1c. Φ doz.

VEGETABLES.—Potatoes, Mercers, \$3@53 50 Φ bbl.; White, \$2 50@2 75; Sweet, Philadelphia, \$2 75@2 35; Virginia, \$2 50@2 35; Turnips, White, \$1@1 25; Russia, \$1 75@2 25; Beets, \$2 75@3 Φ hundred bunches; Carrots, same; Parsnips, \$3 50@4; Cabbages, \$3@5 Φ hundred; Pumpkins, \$5@8 Φ hundred; Celery, \$1 25 Φ dozen.

FRUITS.—Apples, \$2 Φ bbl.; Cranberries, \$6@7 Φ bbl.

Butter, State 22c.@24c. Φ lb.; Western, 18c.@19c.; Eggs, 20c.@21c. Φ doz.; Cheese, 10c.@11c. Φ lb.

NEW-YORK CATTLE MARKET.

MONDAY, Oct. 23, 1854.

We find to-day a further dullness in the Market, quite equal to that of last week. The weather and season is most favorable, but the immense quantities of Pork and butchered meats brought in from the country, very sensibly influence the sales.

The supply of Cattle, as will be seen, is large, and includes all sizes and qualities, without, however, any improvement in the last report.

By far the best cattle, for a few weeks past, have come from Chester County, Pa. They are usually of good size, and well fattened, and quite creditable to the State. Such animals sell much more readily than others. There is a large lot of "stuff" on hand to-day, much of which will be, and all of which ought to be, left over, indefinitely.

Best quality is selling at9c@10c. Φ lb.
Fair do. do.7 $\frac{1}{2}$ @9c. do.
Inferior do. do.6 $\frac{1}{2}$ @7 $\frac{1}{2}$ c. do.

Among others we notice 104 half-fed beeves from Illinois, owned by E. Ferran, of Ohio, and fed by Stewart & Ford. They were fair Western cattle, and sold from 8 $\frac{1}{2}$ c. @9 $\frac{1}{2}$ c. Φ lb. weight about 650 lbs.

We notice, also, 51 half-fed cattle from Chester County, Pa., belonging to Samuel Ulery. These were sold by W. H. Gurney, from 9c.@9 $\frac{1}{2}$ c., good fair quality, and estimated to weigh about 700 lbs.

Also, 131 grass-fed steers, from the same county, owned by Killough and Harlan. These were of fair quality, and sold for about 9c. per lb. Weight estimated at near 600 lbs.

Also, 41 Durham cattle, from Fayette Co., Ky. These were owned by Castleman and Humphreys, were of fair quality, and selling at 9@9 $\frac{1}{2}$ c.

H. Underwood had 74 good beeves, from Chester Co., Pa., which were selling for 9c.@10c. Weight estimated at 750 lbs.

We noticed two droves, of 75 each, owned by Joseph Williams, of Chester Co., Pa., and sold by Culver, Hurd & Co., for 9c.@10c. Estimated to weigh from 650 to 700 lbs.

Also, 119 from the same place, owned by Samuel Ulery; good cattle, and selling from 9c.@10c.

The following are about the highest and lowest prices:

Beeves.....	7 $\frac{1}{2}$ c.@10c.
Cows and Calves.....	\$18@55.
Veals.....	4c.@6c.
Sheep.....	\$2@5 50.
Lambs.....	\$1 50@5.
Swine.....	4 $\frac{1}{2}$ c.

Mr. Chamberlain reports beeves, 7c.@9 $\frac{1}{2}$ c.; cows and calves, \$25@50; veals, 5c.@7c.; sheep, \$2@5; lambs \$1 75@4.

Mr. Browning reports beeves, 7 $\frac{1}{2}$ c.@9 $\frac{1}{2}$ c.; cows and calves, \$25@50; veals, 5c.@6 $\frac{1}{2}$ c.; sheep and lambs, see sales below.

Mr. O'Brien reports beeves, 7 $\frac{1}{2}$ c.@9 $\frac{1}{2}$ c.; cows and calves \$25@40.

Washington Yards, Forty-fourth-street.

WANTED.—A situation, by a married man, as Manager or Foreman on a farm. His wife would undertake the dairy if required. Thoroughly understands farming in all its branches. Has been accustomed to the breeding of first rate stock from his youth. Has been in this country about seven months. Best of reference given from his late employer—one of the first agriculturists in the United States. Apply at this office.

1,000 ORNAMENTAL TREES FOR
\$100—Suitable for Belts, Masses, Shrubberies, Woods, &c., in the best and hardiest varieties, strong and well grown—delivered in Boston and New-York. Price list on application.
B. M. WATSON,
56-63 Old Colony Nurseries, Plymouth, Mass.

IMPROVED ESSEX PIGS.—The subscribers are now ready to engage pigs from Fall litters, got by their superior Boars, LORD WESTON and UNCLE TOM. Prices—\$25 per pair; \$15 a single pig.

Also, the reserved lot of five, from a Spring litter, which won the first prize at the New-York State Show this year; consisting of three boars and two sows. Price—\$20 each.
In all cases the money must be forwarded before shipment of the pigs; which will be well boxed, and sent by express or otherwise, as desired.
W. P. & C. S. WAINWRIGHT,
59-62 Rhinebeck, Dutchess Co., N. Y.

MULES FOR SALE.—The subscriber

keeps constantly on hand 400 to 500 MULES, of all sizes. Among these are some of the choicest animals in the United States; 16 hands and over in height, and well proportioned.

Mules are almost the only working animals used in portions of the Southern States, the West India Islands, and Spanish possessions, where severe work and hard usage are allotted them, and under which horses would soon die. An equal advantage would follow their introduction among farmers and others, in the northern States. They are not only much harder than horses, but they will draw more in proportion to their weight; will endure a great deal more; live twice as long, and eat less; and the only dressing or currying they need, is a soft place to roll on. They are gentle, tractable, and easily managed; and nobody who has ever tried them will ever give them up for horses or oxen.
Call on, or address by letter,
JAMES BUCKALEW,
Jamesburg, New-Jersey.

SUPREME COURT.—In the matter of the

Staking of lands for a new Reservoir, between Eighty-sixth and Ninety-sixth-streets, and the Fifth and Seventh-avenues in the City of New-York.

To all owners, mortgagees, lessees, occupants, and other persons, in any matter, by judgment, decree or otherwise, entitled unto, or interested in the lands or premises above mentioned, or any part thereof.

Notice is hereby given that you are required to appear before the Commissioners of Appraisal in the above entitled proceeding, at the office, No. 293 Broadway, the third story front room, at 10 o'clock, A.M., on any day (Sundays excepted) on or prior to the 21st day of October next, and to produce the evidences to your title or interest therein. In default thereof, and in case the person entitled or interested as aforesaid shall not be ascertained by or be known to the said Commissioners, or be fully known, the same will be reported to the Supreme Court as belonging to unknown owners.

It being the desire to consummate this great improvement, and to present the report at the earliest day consistent with proper examination, and due regard to rights and interests affected, it is earnestly requested that all parties note and comply with the preceding notice, as no other or further notice will be issued.

Dated New-York, September 1, 1894.

EDWARD C. WEST,
ABRAHAM TURNURE, } Commissioners.

DANIEL DODGE,
ROBERT J. DILLON, Counsel to the Corporation.

N.B.—All papers published in the City of New-York are requested to publish the preceding notice until the 21st day of October next, once in each week, and to send their bills, with affidavits of publication, to the office of the Counsel to the Corporation, to be paid on the final taxation of the proceedings.

STATE OF NEW-YORK—Secretary's Of-

fice, Albany, August 10, 1894.—To the Sheriff of the County of New-York:—Sir: Notice is hereby given that at the GENERAL ELECTION to be held in this State on the TUESDAY succeeding the first Monday of November next, the following OFFICERS are TO BE ELECTED, to wit:

A Governor, in the place of Horatio Seymour;
A Lieutenant-Governor, in the place of Samuel E. Church;
A Canal Commissioner, in the place of Henry Fitzhugh; and
An Inspector of State Prisons, in the place of Henry Storms;
All of whose terms of office will expire on the last day of December next.

A Representative in the Thirty-fourth Congress of the United States, for the Third Congressional District, composed of the 1st, 11th, 12th, 13th, 14th and 15th Wards in the City of New-York; for the Fourth District, composed of the 16th, 17th, 18th and 19th Wards of the City of New-York; for the Fifth District, composed of the 20th and 21st Wards in New-York, and the City of Williamsburg in Kings County; for the Sixth District, composed of the 22nd, 23rd and 24th Wards in the New-York; for the Seventh District, composed of the 25th, 26th and 27th Wards in New-York, and for the Eighth District, composed of the 28th, 29th and 30th Wards in New-York.

County Officers also to be selected for said County:

Sixteen Members of Assembly;
A Surrogate, in the place of Alexander W. Bradford;
A Recorder, in the place of Francis R. Tillou;
A City Judge, in the place of Velmore R. Beebe;
A Mayor, in the place of Jacob A. Westervelt;
A Register, in the place of Garret Dyckman;
A Commissioner of Streets and Lamps, in the place of George G. Glazier, who was appointed to fill a vacancy caused by the resignation of Henry Arzularius;
A Police Justice for the Second District, in the place of Daniel W. Clark, who was appointed to fill a vacancy caused by the death of John McGrath;
Two Governors of the Alms House, in place of Gustavus A. Conover and William Plunkney, appointed to fill vacancies.

A District Attorney, in the place of Lorenzo B. Shepard, who was appointed to fill a vacancy caused by the death of Nathaniel B. Blunt.

A Civil Justice and a Police Justice for the Seventh Judicial District, composed of the 31st, 32nd, 33rd, and 34th Wards.

A Police Justice for the Eighth Judicial District, composed of the 35th and 36th Wards.
Yours respectfully,
E. W. LEAVENWORTH, Secretary of State.

SHERIFF'S OFFICE, New-York, Aug. 14, 1894.

The above is published pursuant to the notice of the Secretary of State and the requirements of the statute in such case made and provided.

Sheriff of the City and County of New-York.

All the public newspapers in the County will publish the above once in each week until the Election, and then hand in their bills for advertising the same, so that they may be laid before the Board of Supervisors and passed for payment. See Revised Statutes, volume 1, chapter 6, title 3, article 3, part 1, page 140.
[53-60] JOHN ORSER, Sheriff.

MISCELLANEOUS SEEDS.—Osage, Orange, Locust, Buckthorn, Tobacco, Common and Italian Millet, Broom Corn, Cotton, Flax, Canary, Hemp, Rape and Rice.

FRUIT TREES.—Choice sorts, including the Apple, Pear, Quince, Plum, Peach, Apricot, Nectarine, &c., &c.

ORNAMENTAL TREES and SHRUBS.—Orders received for all the native Forest Trees and shrubs and for such foreign kinds as have become acclimated. R. L. ALLEN, 189 and 191 Water-st.

POULTRY.—D. FOWLER, No. 14 Fulton Market, New-York, dealer in Live and Dressed Poultry of all kinds; for Shipping, &c. Also all the various kinds of Fancy Poultry, Pigeons, &c., for Breed.

N. B.—Persons having good Poultry to dispose of would do well to give Mr. F. a call before selling elsewhere.

Agricultural Books.

BOOKS FOR THE FARMERS.

ALL SENT FREE OF POSTAGE.

Furnished by R. L. ALLEN, 189 and 191 Water-st.

I. The Cow, Dairy Husbandry, and Cattle Breeding. Price 25 cents.

II. Every Lady her own Flower Gardener. Price 25 cents.

III. The American Kitchen Gardener. Price 25 cents.

IV. The American Rose Culturer. Price 25 cents.

V. Prize Essay on Manures. By S. L. Dana. Price 25 cents.

VI. Skinner's Elements of Agriculture. Price 25 cents.

VII. The Pests of the Farm, with Directions for Extirpation. Price 25 cents.

VIII. Horses—their Varieties, Breeding, Management, &c. Price 25 cents.

IX. The Hive and Honey Bee—their Diseases and Remedies. Price 25 cents.

X. The Hog—its Diseases and Management. Price 25 cents.

XI. The American Bird Fancier—Breeding, Raising, &c., &c. Price 25 cents.

XII. Domestic Fowl and Ornamental Poultry. Price 25 cents.

XIII. Chemistry made Easy for the Use of Farmers. Price 25 cents.

XIV. The American Poultry Yard. The cheapest and best book published. Price \$1.

XV. The American Field Book of Manures. Embracing all the Fertilizers known, with directions for use. By Browne. Price \$1 25.

XVI. Buist's Kitchen Gardener. Price 75 cents.

XVII. Stockhart's Chemical Field Lectures. Price \$1.

XVIII. Wilson on the cultivation of Flax. Price 25 cents.

XIX. The Farmer's Encyclopedia. By Blake. Price \$1 25.

XX. Allen's Rural Architecture. Price \$1 25.

XXI. Phelps's Bee Keeper's Chart. Illustrated. Price 25 cents.

XXII. Johnston's Lectures on Practical Agriculture. Paper, price 25 cents.

XXIII. Johnson's Agricultural Chemistry. Price \$1 25.

XXIV. Johnson's Elements of Agricultural Chemistry and Geology. Price \$1.

XXV. Randall's sheep Husbandry. Price \$1 25.

XXVI. Miner's American Bee-Keeper's Manual. Price \$1.

XXVII. Dadd's American Cattle Doctor. Complete. Price \$1.

XXVIII. Fessenden's Complete Farmer and Gardener. 1 vol. Price \$1 25.

XXIX. Allen's Treatise on the Culture of the Grape. Price \$1.

XXX. Youatt on the Breeds and Management of Sheep. Price 75 cents.

XXXI. Youatt on the Hog. Complete. Price 60 cents.

XXXII. Youatt and Martin on Cattle. By Stevens. Price \$1 25.

XXXIII. The Shepherd's own Book. Edited by Youatt, Skinner and Randall. Price \$2.

XXXIV. Stephens's Book of the Farm; or Farmer's Guide. Edited by Skinner. Price \$1.

XXXV. Allen's American Farm Book. Price \$1.

XXXVI. The American Florist's Guide. Price 75 cents.

XXXVII. The Cottage and Farm Bee-Keeper. Price 50 cents.

XXXVIII. Moore on the Culture of the Grape. Price 50 cents.

XXXIX. Country Dwellings; or the American Architect. Price \$6.

XL. Lindley's Guide to the Orchard. Price \$1 25.

XLI. Gunn's Domestic Medicine. A book for every married man and woman. Price \$3.

XLII. Nash's Progressive Farmer. A book for every boy in the country. Price 50 cents.

XLIII. Allen's Diseases of Domestic Animals. Price 75 cents.

XLIV. Saxton's Rural Hand-books. 2 vols. Price \$2 50.

XLV. Beattie's Southern Agriculture. Price \$1.

XLVI. Smith's Landscape Gardening. Containing Hints on arranging Parks, Pleasure Grounds, &c. Edited by Lewis F. Allen. Price \$1 25.

RECENTLY PUBLISHED.

XLVII. The Farmer's Land Measurer; or Pocket Companion. Price 50 cents.

XLVIII. Buist's American Flower Garden Directory. Price \$1 25.

XLIX. The American Fruit Grower's Guide in Orchard and Garden. Being the most complete book on the subject ever published.

L. Quinby's Mysteries of Bee-Keeping Explained. Price \$1.

DIRECTIONS FOR THE USE OF GUANO.

ANO.—A full and minute description of the different crops and soils to which Peruvian Guano is adapted, with full directions for its application, a pamphlet of 56 pages, and can be sent through the mail. Price 25 cents.

R. L. ALLEN, 189 and 191 Water-st.

CHINESE PIGS—From pure bred Stock

direct from China—very fine of their kind

B. & C. S. HAINES, Elizabethtown, New-Jersey.

FRUIT TREES FOR SALE.—I have now

ready for sale one of the most complete selections of Fruit Trees ever offered in this part of the country, and as thrifty and handsome trees as can be found in the United States. Apples, Pears, Peaches, Plums, Grapes, Quinces, Strawberries, &c. Subscribers to this paper will find in it the coming year full directions for managing Fruit Trees in the best manner, with a complete list of the best varieties. WM. DAY, Morristown, N. J.

PEACH TREES.—The subscriber offers

for sale, from their Nurseries at Rumson's Neck, Shrewsbury, N. J., Peach Trees of the choicest varieties. Orders for the same by mail to be directed to them at Red Bank, Monmouth County, N. J. [33-69] ASHER HANCE & SON.

FANCY FOWLS.—Shanghai Fowls—direct

importations—and Golden Pheasants, for sale by

WM. DAY, Morristown, N. J.

FOR SALE, AT THE SOUTH NOR-

WALK NURSERY, a fine stock of the New-Rochelle (or Lawton) Blackberry Plants, at \$6 per dozen; also the White-fruited variety at \$3 per dozen; also the new or pure Red Antwerp Raspberry. GEO. SEYMOUR & CO., South Norwalk, Conn.

SUPERIOR SEED WHEAT.—A LARGE

assortment of the best varieties of improved Seed Wheat; among which are the Red Mediterranean, White Mediterranean, Soule's and Blue stem. For sale by

R. L. ALLEN, 189 and 191 Water-st.

FANCY FOWLS FOR SALE.—A variety

of pure bred Fowls, Asiatic, Spanish and Game Fowls, Sebright, Black African, Antwerp, and other Bantams. B. & C. S. HAINES, Elizabethtown, New-Jersey.

THE HORSE, THE HORSE,

NOBLEST OF DOMESTIC ANIMALS, And the one most frequently ill-treated, neglected, and abused. We have just published a Book so valuable to every man who owns a horse, that no one should willingly be without it. It is entitled,

THE MODERN HORSE DOCTOR. and is from the pen of that celebrated English Veterinary Surgeon, Dr. GEO. H. DADD, well known for many years in this country, as one of the most successful scientific and popular writers and lecturers in this branch of Medical and Surgical science. The Book which he now offers to the public is the result of many years' study and practical experience which few have had.

From the numerous and strong commendations, of distinguished men and the newspaper press, we select the following: Extract from a letter from Hon. John H. Clifford, Ex-Governor of Massachusetts:

NEW-BEDFORD, May 11, 1854.
Dr. DADD—Dear Sir: I hope your new work on the noblest creature that man has ever been permitted to hold in subjection—the Horse—will meet with that success which all your efforts in this direction so well deserve.

Your obedient servant,
JOHN H. CLIFFORD.

BOSTON, May 13, 1854.
Dr. DADD—My Dear Sir: I am greatly obliged to you for the valuable treatise, the results of your own investigations, which you have recently issued, hoping that it may meet with the patronage of a discriminating community.

I remain yours with great regard,
MARSHALL P. WILDER.

The "Modern Horse Doctor," by Dr. G. H. Dadd, is a manual of genuine science, and ought to be owned and studied on the score of humanity, as well as interest, by every man who owns a horse. [Boston Congregationalist.]

Dr. Dadd has had great experience in the cure of sick horses, and explains the secret of his success in this volume. [New York Tribune.]

The author of this work is well known as a most skillful veterinary surgeon. His book is based on the soundest common sense, and as a hand-book for practical use, we know of nothing to compare with it. [Yankee Blade.]

We know Dr. Dadd well, and are satisfied that he possesses most important qualifications for preparing such a book as this. [New-England Farmer.]

Messrs. Jewett & Co. have just published a very valuable work by Mr. Dadd, a well-known veterinary surgeon, on the causes, nature and treatment of disease, and lameness in horses. [Farmer's Cabinet.]

This is one of the most valuable treatises on the subject ever published; and no owner of that noblest of the animal race, the horse, should be without it. Especially should it be in the hands of every hotel and livery-stable keeper. To many a man would it be worth hundreds of dollars every year. [Ind. Democrat, Concord.]

By far the most learned and copious work on the horse and his diseases we have ever seen. [N. Y. Evangelist.]

One of the greatest and most commendable qualities of this work is, it is practical and plain to the comprehension of those farmers and others for whom it is mainly designed. The course of treatment favors generally a more sanative and rational system of medicine than that recommended in any previously existing works on farriery. No farmer or owner of a horse should be without this book. Stable-keepers, stage-proprietors and hackmen we believe would derive profit by having at least one copy hung up in their stables for use and reference by their stable men. [Daily News, Philadelphia.]

There is more common sense in this book than any of the kind we have ever seen, and farmers and owners of horses would find it a matter of economy to possess themselves of it. It will be of more service than the counsel of a score of ordinary doctors. [Albany Courier.]

We deem this decidedly the best and most reliable work on the "Cause, Nature, and treatment of Disease and Lameness in Horses," ever published. [Nantucket Inquirer.]

What we have read of this book induces us to regard it as a very sensible and valuable work; and we learn that those much more competent to judge of its value, have given it their unqualified approval. [Eve. Traveller, Boston.]

This book supplies a great desideratum which Skinner's admirable treatise on the horse did not fill. Every man may be his own veterinary surgeon, and with much greater safety to his noble animal, than by trusting him to the treatment of the empirical itinerants who infest the country. It is well illustrated, and should be purchased by every man who owns a horse. [Eve. Mirror, New-York.]

This is a book that should be forthwith put into the hands of all who own or drive horses, whether for the dray or gig, for the plow, omnibus or road, for hard service or pleasure. [McMakin's Courier, Phila.]

A good, clearly-written book, which should be in the hands of every man who has a horse whose ill's his affection or his purse make it worth while to cure. [Bangor Mercury.]

It is a valuable book to those who have the care of horses. [Hartford Herald.]

This is a scientific, thorough and complete treatise upon the diseases to which one of the noblest of animals is subject, and the remedies which they severally require. [Troy Budget.]

He is not worthy to have a horse in his care who will not use such a work to qualify himself for his duties to this animal. [Commonwealth, Boston.]

Published by JOHN P. JEWETT & CO., Boston.
JEWETT, PROCTOR & WORTHINGTON, Cleveland, Ohio.

For sale by all Booksellers. 50-63

HORSE POWERS THRESHERS AND

SEPARATORS.—The Endless Chain or Railway Powers of our own Manufacture, both single and double geared, for one and two horses, which has never been equalled for lightness in running, strength, durability, and economy. They are universally approved wherever they have been used.

2. The Bogardus Power, for one to four horses. These are compact and wholly of iron, and adapted to all kinds of work.

3. Eddy's Circular Wrought-iron large Cog Wheels, for one to six horses. A new and favorite power.

4. Trimble's Iron-sweep Power, for one to four horses.

THRESHERS.—Improved Threshers upon the best principles, threshing clean with great rapidity, without breaking the grain.

One-Horse, Undershot \$25

Two-Horse, do \$30 to \$35

One-Horse, Overshot \$23

Two-Horse, do \$33 to \$38

Separator, which greatly facilitates cleaning the grain and preparing it for the fanning-mill . . . \$7 to \$10

All the above-named machines are guaranteed the best in the United States. R. L. ALLEN, 189 and 191 Water-st.

TREES and PLANTS.—PARSONS &

CO., Flushing, near New-York, offer for sale their usual assortment, with the addition of many rare and beautiful Fruit Trees, for the Orchard and the Garden; Ornamental Trees, Shrubs, and Roses, for the Avenue, Lawn, or Cemetery; Vines for the Grapery, and Exotic Plants for Greenhouse culture. Catalogues can be obtained at No. 60 Cedar-st., or will be sent by mail to all post-paying applicants inclosing a postage stamp. 23-71

Special Notices to Subscribers, Correspondents, &c.

SUBSCRIPTIONS can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September, as a half yearly volume of 416 pages, with a complete index, begins on each of those dates.

Those wishing their papers changed from one office to another, should give the name, County, and State, of their old and new Post-office.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Clubs may add to their number at the same rate per copy as was paid by the original members.

The paper is stopped when the time for which it is paid expires. A notice or bill is usually sent in the last number.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then inclose them in presence of the Postmaster. Give the Post-office, and the County and State. Write these very plainly.

Economical Arrangement to Furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished			
with Harper's Magazine, one year for	-	-	\$4 00

PUBLISHERS' ANNOUNCEMENT!

THIRTEENTH VOLUME OF
THE AMERICAN AGRICULTURIST,
 THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

The American Agriculturist,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

N. B.—The work is divided into two semi-annual volumes of 416 pages, each volume having complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume for the bound work.

COMPREHENSIVE IN ITS CHARACTER.

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the Agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "Farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent Farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of Agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers only that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon its *own merits*; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammeled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great Agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the joint Editorial supervision of Mr. A. B. ALLEN—its principal editor for the first ten years—and Mr. ORANGE JUDD, A. M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFF, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical Agriculture, and, in addition to these, a number of other eminent Agricultural and Horticultural writers.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and Post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers.....	\$2 00	A YEAR, \$2 00
" Clubs of 3 do.....	1 67	" 5 00
" " 5 do.....	1 60	" 8 00
" " 10 do.....	1 50	" 15 00
" " 20 do.....	1 25	" 25 00

The money always to accompany the names for which the paper is ordered.

The Postmaster, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Postmaster, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, Weekly Tribune, or Weekly Times, or any other paper or periodical in this City, the cost not exceeding two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if inclosed and mailed in the presence of the Postmaster.

Communications for the paper should be addressed to the Editors; Subscriptions, Advertisements, and all matters relating to the business department, should be addressed to the Publishers,

THE COLD VINERY OF WILLIAM VIAL, ESQ.

WHILE at Providence, attending the Rhode-Island State Fair, it was our privilege to visit this very promising vinery. Mr. Vial is one of the most successful amateur cultivators in the city, and showed us, in his well cultivated grounds, how much of the useful and beautiful may be realized, from a few square rods of ground. Every foot of soil was turned to good account, but the special attraction of the garden was the cold vinery. This was placed against the back wall of the garden, nearly fronting the south. It is a lean to, about 45 feet long by 15 in breadth, and is stocked with 15 varieties of grapes. The vines were three years from planting, and were well filled with very fair, handsome bunches of grapes; though many had already been gathered for the exhibition and for the table.

About a dozen cultivators met in this glass house, to test the quality, in succession, of fifteen varieties of foreign grapes. We liked this feature of our entertainment very much, as it gave us not only a feast for the eye and the palate, and introduced us to gentlemen whose acquaintance we shall be happy to renew, but it helped us to a better knowledge of some of the finest grapes for the cold vinery. The comparative merits of these grapes can only be ascertained by eating them fresh from the vine, with the names before you. While all were pronounced very good, not so much in courtesy to our host as in justice to the fruit, the Austrian Muscat received the unanimous suffrage of the party, as the best of the collection. This is a white grape, and has the rich spicy flavor of the Frontignan, in still higher perfection. It is to us a new grape, and we were unable to learn any thing of its origin or history. Next to this, we put the Black Frontignan, and after that the White Malvasia—a beautiful fruit both to the eye and the taste. The Black Hamburgs, of course, were among the collection, and maintained their well established reputation.

As a demonstration of what a business man in the city may do with a little time and money, this vinery is a valuable experiment for the public. The whole cost of border, frame, glass, &c., was not far from four hundred dollars, and the whole labor of attending it, with the exception of four days' work by a gardener, had been performed by himself, in the brief intervals of business.

In the preparation of the border, which was about thirty feet wide, attention was first paid to drainage. Then a little of almost every thing available, as a fertilizer, was put in, and thoroughly mixed. Bones, oyster shells, the sweepings of shoemakers' shops, wastes from the tannery, street manure, ashes, soot, old plastering, cinders from burnt buildings, fish, stable-manure, weeds, chip dirt, rags, leaves, loam, and muck, may all enter profitably into the grape border. This is a matter of prime importance, as the grape is a gross feeder.

A vinery, of course, can be built much cheaper than this, but four hundred dollars is not a very large outlay for a permanent structure in the garden, that will last an ordinary life-time. The fruit, too, if there is a surplus, always finds a ready market in the cities, and at high prices. A dollar a pound is no unusual price for these grapes, sold by the quantity. Vineries will pay well as a pecuniary investment for years to come. We are glad to see that these beautiful ornaments of the garden are rapidly multiplying in our cities and villages.

FAIR OF THE HAMPSHIRE COUNTY AGRICULTURAL SOCIETY.

THIS fair came off at Amherst, Mass., October 18th and 19th. As the seat of the operations of this Society is mainly in the valley of the Connecticut, we were prepared to see a good display of fine cattle, fruits, and vegetables. This Society is of recent origin, but is already well established, and is doing a good work in waking up the farming population to a better cultivation of their fat acres.

We were too late to see the neat stock, on Wednesday, but had a fair view of the horse-flesh on Thursday morning. Probably owing to the great New-England horse show at Brattleborough, held at the same time, there were not many stars present. But we saw some good looking draught-horses, that drew premiums, as well as big loads, and handled a cart-load of stones with as much ease as if they had had a pedigree going back to Bucephalus of Alexandrian fame. The show of colts was thought to be an improvement upon any former exhibition.

The vegetables were exceedingly good, what there were of them; but, in such a region, there should have been ten times as many. The potatoes were magnificent. The harvest of this esculent is uncommonly good; and why, in our city, we should be paying a dollar a bushel, while here in these

towns they can be bought for forty to fifty cents, is a question for consumers to ponder. They can be sent to tide-water, at New-London, for seven cents a bushel. The finest specimens of the Marrow squash we have seen this year, were grown by Luke Sweetser, of Amherst. There were also fine samples of the Valparaiso and the Crook-neck.

We have never met with finer butter than was displayed upon these tables. Several of the lots had that beautiful waxy appearance, which showed that the buttermilk was all worked out of it. The cheese, also, was very fine.

The most striking feature of the fruit hall was the display of apples. There were nearly 350 plates; and here were samples of Spitzenbergs, Blue Pearmaines, Baldwins, Hubbardstons, and other fine varieties, that we have never seen surpassed. The next feature of the Show was, the total absence of pears. To one accustomed to the magnificent display of this fruit, at Hartford, a little lower down in this valley, the absence was marvelous. What freak of Pomona is it that has withheld this prince of fruits, from a region where the apple grows in its perfection? It is the common impression here that the pear will not thrive in this soil, and we saw trees that had been planted a dozen years or more, that manifestly justified this opinion, if they were any measure of the best efforts of the soil. Upon inquiry we found that bone-dust or phosphate of lime, in any shape, had not been applied in their cultivation. This may be the one thing needful in the soil to fit it for producing this fruit. We trust cultivators will try it, and that we shall hereafter see, in their exhibitions, pears to rival their magnificent apples. The samples of grapes were far too few. The Isabella ripens well here, in most seasons. We think the Diana would uniformly mature.

The address was delivered, in the church, by Rev. W. Clift, of Stonington. We have rarely seen a larger or more attentive audience. The subject—"The Economy of Scientific Agriculture"—seemed appropriate to the place and the occasion, and was very well received. Some 350 sat down to the dinner, and after the eatables were discussed, about two hours were spent in listening to reports of the various committees, and to speeches from gentlemen present. One of the cheering indications of this occasion was, the presence of so many clergymen from the neighboring parishes, entering heartily into the work of the Society, and

discharging their duties as members of the committees. Addresses were made by Hon. Edward Dickinson, of Amherst; Hon. J. Proctor, from Essex County; Prof. Nash; Rev. Mr. Bullfinch, of Dorchester, and other gentlemen.

We very much like this feature of our Agricultural Shows, and hope the custom may become universal. The members may as well take dinner together as to scatter, and the occasion serves as a sort of experience-meeting, where farmers communicate a great many scraps of information that would otherwise be lost.

DOVER POTATOES AND ONIONS.

RAISED BY CYRUS DYER, VUE DE L'EAU, MASS.

We noticed in the Practical Farmer an account of this gentleman's crops, in a private letter addressed to the editor. Two hundred and fifty bushels of potatoes, to the acre, along the sea board, is a very good yield in these days. We hear excellent accounts of the Dover potatoes, and the crop of Mr. Dyer would go to confirm the commonly received opinion, that they give a much larger yield, and are freer from rot, than most of the old varieties. Their quality is said to be first rate. Mr. Dyer writes:

This has been considered a hard season; still, had all my brother farmers been able to plant as early as I did, even if their farms were in no better order than mine, you gents that occupy seats with such comfortable cushions, would not have been compelled to pay so much for your potatoes. I must give you a short history of my work in this line. You are aware of the vast extent of my domain, and will therefore naturally expect something astounding.

I planted, near the mansion, half an acre with Dover potatoes; put into the ground on the 7th of April last. As there prevailed so universal a complaint relative to the drouth, I thought I would accurately notice the yield. The potatoes were dug mostly before the late rains; finished a few days since. As a part of the vines continued green, I let a small portion remain, to notice the effect, whether rain and warm weather would cause them to rot. I saw no effect of the kind; think the potatoes grew some; also many little ones started. The potatoes measured, as taken from the field, 120 bushels.

AN ONION PATCH.

Near to the potatoes I have what is called an *onion patch*, containing 28 rods, from which I have taken, this hard year, 100 bushels of as fine yellow onions as you would wish to see. The land had a fair manuring; nothing extra, except that for two years previously I had given it a liberal supply of lime ashes from the kiln. This year, I put shell lime on, at the rate of 100 bushels per acre.

So, you see, that even farming may be better than doing nothing; provided one has good land, plenty of manure, and a disposition for hard work. I wish my potato ground had been ten acres. I could then have raised the means to have enabled me to go to Springfield. I much want to look at that show; have plenty of time, but no money.

N. B.—I put plaster into the hills of potatoes. Respectfully yours,
Vue de l'Eue, Mass. Sept. 20. CYRUS DYER.

WHEN you retire to bed think over what you have done during the day.

BEST AMERICAN HORSES FOR FRANCE.

We find the following good advice on this subject from Carl Benson, in the Spirit of the Times:

Our American horses are holding their own abroad. Not long ago a carriage team went out to England for one of the Rothschilds; and it is becoming quite the fashion for New-Yorkers to bring their nags with them to Paris. Probably at least a dozen arrive every season, some of them very fine animals. but they are not all good ones—that is to say, good for Paris. Perhaps, while we are on this subject, a few more remarks on the best sort of horses to bring out here, may not be unacceptable to some of our Gothamite readers.

It has been more than once remarked that the French do not understand or appreciate speed; and even when a Frenchman does take a fancy to have a trotter, it is not generally such a one as would be able to dust many of our flyers. In the space of something like three years, I have noticed just four horses in Paris that might safely be backed to beat three minutes. If, therefore, a man wants to bring out here a horse for his own special driving, he had better take a *half-fast one*—equal to 3:15 or so—just such a one as would never command a high price with us, because anything of any pretension on the road would be sure to beat him. But then he should be handsome—or perhaps it would be more correct to say *showy*. The French go for *looks*, and pay for *looks*, as we do for speed. And when it comes to carriage and family horses, the question of beauty is complicated with some others, rendering a little more detail necessary. First, then, by a handsome horse a Frenchman understands a handsome-going horse, and by a handsome-going horse he means a *steppair* (Anglais, stepper), a horse with *clambering* action, lifting up his feet, especially his fore feet, as if he meditated continually “such a getting up stairs.” A *natural* high action is doubtless in most cases (even then not in all cases) a beauty; you may remember what a pretty effect it is in some of our second class trotting horses, such as Boston Girl and Trojan. But many of the horses for the Paris market are trained artificially, so that some of them look as if they had a *spring-halt forward*, and many of them *dish* or twist their feet outward, instead of putting them straight up and down. Nevertheless, the French delight in high action, however obtained, and three or four inches in height of a horse's step makes as much difference in his value to them as eight or ten seconds in his time to us. Also, in the case of a pair, it is important that they should *step well together*, or lift their feet in the same way, and to the same height.

Next to a horse's looking when in motion, comes his looking when at rest. The Parisians do not like to see a horse stand with his legs perpendicular, but stretched out from him at an angle of 30° or 40°. They think this shows blood. I don't think it shows anything—except, perhaps, that the owner is an ass, or that the horses had been taught the trick when young; most horses can be taught it very easily, I have no doubt. Some of the worst animals I ever knew, in all other respects, had this knack of standing with their legs out to perfection. Still it is worth remembering.

As to color, there is a sort of tradition that dapple-grays are, other things being equal, more highly prized than other horses. I doubt if it is so in practice, or if you could sell a horse five dollars dearer for his being a dapple-gray, though if you wanted to match him, you might perhaps have to pay a little more. The fashion now sets rather to

dark horses, the Emperor having set the example.

Many of the French have a prejudice against horses with white marks, especially those with white hind feet.

Size is a very important consideration for carriage horses. The Morgan style of horse, about 15½ hands high, so deservedly a favorite with us, is too small for Paris work. The French carriages are generally much heavier than ours, and look much larger, on account of the high coachman's seat. Their broughams are perhaps smaller and lighter than ours, but then they use one horse where we do two. A carriage horse for the Paris meridian ought to be full sixteen hands high, unless he has a long neck and carries his head well up, in which case 15-3 may answer. A large horse, well broken to double and single harness, and rather showy, is always saleable, no matter how inferior he may be in speed and bottom.

The French are afraid of a hard pulling horse, but they like one who *looks as if he pulled*. His being an unsteady trotter, and breaking into a canter now and then, is not the least drawback.

I should not advise any one to pay a fancy price for carriage horses to bring to Europe—by a fancy price I mean \$1200 or \$1500—for he could probably get as good a pair in England or even in Paris for the same money—perhaps less, when the expenses of transportation are taken into account. But if any gentleman coming abroad to make a stay of a year or two, can get a good pair for \$600 or \$800 (they must be large and showy, remember), or has a pair that suit him, which he can not sell for more than that price at home, I do think it quite worth his while to bring them along. As to saddle horses, they can hardly be said to exist in the North. Good Southern ones I am inclined to think worth bringing over—such as can be bought in Virginia or South Carolina for \$150 to \$175—such a horse will cost about \$365 by the time he arrives in Paris: his owner may ride a year or two, and then sell him for \$400. The larger he is the better, for even under saddle the French prefer a big horse.

I had almost forgotten to mention the different standard of age on the two sides of the water. We think a horse just in his prime at nine—the Europeans consider him old at eight. And as their horses are broken in and worked much younger than ours, they often are older at eight than ours at eleven. Youth, therefore—that is, not being above seven years—is a more considerable item in Parisian than in New-York value.

As to vehicles, of course no one would think of bringing out a large carriage, for the French make berlines and broughams about as well as we do, and all sorts of barouches much better; not absolutely better for the workmanship, indeed, but much handsomer, and more stylish in form and accessories; besides which, the *ad valorem* duty would make the American carriage cost more than a French one. With wagons, and all light vehicles, the case is different. If you want to have these you must bring them with you, as the French have no wood of which they could be made. On this account it is well to bring a few *extra spokes*, as in the case of accident these cannot be replaced; any other part may be, after a fashion.

As to selling your wagon when you have done with it, that is a matter of chance. If you light on a man that wants one, he will probably give double the original cost, leaving you something in pocket, as the expenses are not above 50 per cent; but you may not find a purchaser for three years. I have known a horse, sulkey, and harness, worth \$350 at the outside, sell for \$1000; but that was because the purchaser would have a

sulkey on a certain day, and there was no other in Paris. Such chances do not happen often. Carriage or saddle horses may very well pay their expenses; a trotting horse is not so likely to, if he cost over \$300 originally. My little mare Fanny had full as much reputation for trotting as she deserved, but the highest *bona fide* offer ever made for her was \$400, rather less than the cost in America. Another mare, belonging to an acquaintance of mine, young, sound, big enough for a carriage horse and quite equal to three minutes, only fetched the same price, though she cost something like \$440 at home.

There is one place in Europe where you can't sell a horse or carriage of any kind, and that is a watering-place. This very Baden, for example, is as unlike Newport or Saratoga in that respect, as it is in a great many others. It may be mentioned incidentally that the native horses of Baden are by no means despicable, and turn out very well when they fall into good hands. A retired officer here has four, three blacks and a bay, which he drives sometimes in separate teams, sometimes four-in-hand. They are not only good looking but show considerable speed, and all the four only cost him \$600. The wheelers alone would be worth that in New-York, and the leaders would be cheap at \$400. These Baden horses look something like American ones; they are usually of a middle size, inclined to be spare of flesh rather than corpulent, clean-limbed, and handsomely built, but sometimes a little too heavy in the head.

When there is a talk of buying horses, one naturally looks to England, especially if saddle horses be in question. Very good "hacks" are continually sold there for \$125 to \$130, but whether a stranger can be sure of obtaining one at that price is somewhat doubtful. The fashionable London dealers are almost as dear as the Parisian.

If a man is willing to put up with an inferior saddle horse, he can generally pick up one in Paris reasonably enough, say \$160. But it is hard to pick up a serviceable harness horse under \$300, and a dealer won't let you look at anything under \$600.

Perhaps this is about horse talk enough for the present. Some further remarks will be adjourned till after Benazet's hunt, which comes off this week.

FATTENING TURKEYS WITH CHARCOAL.

Much has been published of late in our agricultural journals in relation to the alimentary properties of charcoal. It has been repeatedly asserted, that domestic fowls may be fatted on it without any other food, and that too, in a shorter time than on the most nutritive grains. I have recently made an experiment, and must say that the result surprised me, as I had always been rather skeptical. Four turkeys were confined in a pen, and fed on meal, boiled potatoes and oats. Four others, of the same brood, were also, at the same time confined in another pen, and fed daily on the same articles, but with one pint of very finely pulverized charcoal mixed with their mixed meal and potatoes. They had also a plentiful supply of broken charcoal in their pen. The eight were killed on the same day, and there was a difference of one and a half pounds each in favor of the fowls which had been supplied with the charcoal, they being much the fattest, and the meat greatly superior in point of tenderness and flavor.—*Germantown Telegraph*.

A correspondent of the *Gardener's Chronicle* says: Every one finds great difficulty in keeping garden seats more than a year without constant painting. Gutta serena, thinly laid on, and turned round the sides and nailed, will last for ever.

A SUFFOLK PIG.

With this I send a cut of a Suffolk sow, which I slaughtered at twenty-two months old. I took her from her second litter of pigs when they were six weeks old, November 20th. On the 27th of the next March I slaughtered her.

Her live weight was.....450 lbs.
The carcase and loose fat weighed a small fraction over 400 lbs., say...400 "

Loss.....50 "

AUBURN, N. Y., April 20, 1854. J. M. SHERWOOD.

The above did not reach us till some ten days since, though dated seven months ago.

REAPING AND MOWING MACHINES.

(Concluded from page 100.)

The first of the machines drawn behind the team had also two high wheels, with shafts and framing so elevated as to permit the revolving rakes to bring the corn out below them, thus involving a principle since departed from, and which, if applied to Crosskill's, would permit of its being drawn behind also, instead of pushed before, so as to secure the side delivery, thus avoiding the objection so forcibly and practically brought against Hussey's by Mr. Hume, of Canada West, in the *Mark Lane Express* of last week. Should experience ultimately decide in favor of this mode of draught, Salmon and Scott's machines present another feature already noticed, of permitting their being easily worked both ways, but at a sacrifice of power, the cutting apparatus and driving wheels being out of the line of traction. Mr. Mann, again added a third wheel immediately behind the horses, to give steadiness to the machine—an improvement engrafted on several of our modern ones. Ogle's approached nearer to the French reaper, with the addition of a reel, than its descendants, the Americans—the driving machinery being between two large wheels, with the cutting apparatus and platform projecting beyond the outside of one of them. The American proposition of one large driving wheel, within framing, behind the team, with the second wheel (a small one) on the opposite side of the platform, is greatly superior to any of its predecessors, although, doubtless, subject to further improvement in carrying it out.

The objections brought against Salmon and Scott's machines, and which would also exist against Crosskill's, were the draught removed to the front, relative to the driving wheels and machinery being out of the line of traction, have been obviated by the American automaton, the gathering apparatus

being placed behind these—an improvement which could easily be effected on them also, but at the sacrifice of cutting both ways; for the moment we fix the cutting apparatus at the side (or driving wheels, &c., which is the same thing), there they remain fixed, until we adopt some such plan as exhibited on the French machine, of turning knives, platforms reels, and endless webs from one side to the other, which can easily be done by a horizontal motion, instead of vertical, as the French knife.

In theory, there cannot be a doubt that the Roman plan is superior to the Scotch—i. e., that Crosskill's mode of draught is superior to Dray's, if properly applied; for, in the latter case, the horses can never pull fairly in the line in which they walk, but always a little upon one side, the line of traction making an angle with the line of motion. We might easily enter into a mathematical demonstration of this proposition, were it necessary. We know it was long tenaciously argued by our more metaphysically gifted neighbors of the North, that because the driving-wheel and machinery are behind the team, the resistance was mainly, therefore, in the line of traction. But the fallacy of such a conclusion has long since been admitted even by the North itself; for, according to Newton's well-known law of motion, "action and reaction are equal and contrary." And, moreover, the resistance of the cutting-knife is comparatively little to that of the fingers or gathering apparatus acting against the corn at a great disadvantage of lever power. In practice the facts are observable, the line of traction always making an angle with the line of motion, as any one in the trial field at Lincoln may have perceived; so that the conclusion is obvious to every practical man, even though little versed in mechanics.

On the other hand, if Crosskill's whippertrees are placed at the proper elevation, his wheels of the proper height, the day comparatively calm, the corn standing so as to secure an uniform resistance along the reel and endless web, the lateral action of the web itself fairly counterbalanced, the machine cutting its exact breadth, neither a hair-breadth more nor less, and the horses properly driven, then the lines of motion and traction correspond, and the resistance experienced by the machine is reduced to the minimum in producing a given effect. This machine, doubtless, produces a greater effect than the other, the corn being lashed to the cutting-knife by a reel—instead of the rake, in the other case, worked by a man, and delivered at the side by an endless web, and therefore must experience a greater resistance, and the horses, consequently, a heav-

ier draught. But this has nothing to do with the question at issue—the combination of the above conditions in the harvest field. Now, conceding to the soundness of our proposition, which is susceptible of easy proof, we come to the practical question—Was it realized at Lincoln? And the obvious answer is, Certainly not; for the horses there were neither properly driven, nor the machine equally fed: granting that the other conditions were correct, where farmers must judge the height of their own teams, &c., At times, for instance, it would have cut six inches more, and sometimes even a foot. Consequently the pole was thus far from the center of resistance; so that the line of traction must have formed an angle with the line of motion, although not very perceptible to casual observers. To counterbalance this, the man at the steerage operated against the horses with a long lever-power, like the driver of an engine with a break on the wheel; hence the consequences which follow, viz., an increase of draught not easily estimated when a herculean rustic is alternately pushing this way and that with all his might. In the bustle of a trial field such as Lincoln, less or more exciting horses, the smallness of the patches into which it is subdivided by openings, affording advantages to the other class of machines which are not to be met with in the harvest field generally, and the many turnings consequently experienced. Cross-kills, and those of this class depending so much upon driving and feeding, must always experience a difficulty in getting fair play on such occasions—at least, until our laborers and all parties involved are more thoroughly masters of their work. But, in the meantime, that is no reason why we should impute to machines the misconduct of their drivers and teams; or, *vice versa*, impute to them the good conduct of those who work them, as in the case of the man and rake on Dray's, on whose management so much depends, and who at Lincoln received so little for his trouble at the hands of the public; and Harkes', which was hardly looked at, because an ignorant man did not drive it right.

So much for the cutting and gathering apparatus of reaping machines, and the mode of draught. Many improvements have been made since Pliny wrote his description of the Roman, or rather Gallic machine, used in the extensive plains of Gaul, and no doubt subsequently in Britain, from whence Rome received a large annual import of corn; and, doubtless, if we could see as far before us into the realms of futurity, it would be seen that we are yet a long way from the end of the chapter. But, be that as it may, many improvements were made last year in both classes of machines, although we cannot say that these are sufficient to justify the reversal of the Royal Agricultural Society of England. The utmost that can safely be said here, is, that Carlisle, or the experience and judgment of the future, is left to say whether Gloucester or Lincoln is right; for it can not be denied that greater improvements have been made on the prize machine of the former than on that of the latter, since last year. It is no doubt possible that the one was better prepared for a short trial among green rye, while the other was worse; but what have exceptions or any conditions of this kind to do with the merits of either machine for general harvest work? We are far from saying that the recommendations of the society last year, so generally and justly approved of, have been complied with on either side, especially by the two rival machines; for the principal objections brought against the prize machine from the commencement, still remain in force, while the improvement or simplification of the other, has been effected at an increase of expense,

instead of a decrease, as the public obviously had a right to expect, the American machines being cheaper than Bell's. When a merchant mixes a less expensive article with one of greater, the buyer naturally expects the compound at a medium price. In agriculture, farmers can never separate the mechanical value of a thing from its pecuniary—a fact much in favor of the reversal of the judgment of the society, if not the only basis on which it can be founded. The French reaper belonging to the one class of machines and Mr. Harkes' to the other, have done more perhaps to comply with the recommendations of last year, than any other; the former, by suggesting the reversal of the cutting apparatus, and the latter, improvements on the old circular-knife and gathering drum of Kerr, though neither was successful for reasons already given. Continuous motion has much in its favor, while draining, grubbing, and clod-crushing machines are fast obviating the early objections brought against the circular-knife. As a side delivery, again, the revolving drum has been found to lay the corn better than the endless web, or revolving rakes, in the harvest field, where the machines were in constant operation, and hence had the best opportunity of testing their merits. The master point is, to effect successful combination at little expense, for fortunes can not yet be made out of imperfect machines.

[Mark Lane Express.]

MANAGEMENT OF BARN-YARD MANURE.

We gave a series of articles on this subject, in the last volume of the Rural. In them we asserted that by judicious management all the ammonia might be retained in the manure without the application of any of the so-called fixers. Mr. S. W. Johnson, who is now a student at Munich, under the celebrated Liebig, translates for the Country Gentleman a series of able articles from the German of Prof. Wolff; the last is on the "Fixing agents in connection with liquid manures," and we are pleased to find our opinion confirmed by such high authority. He considers "the addition of chemical fixing agents to the mass of yard manure as unnecessary," and further "that where yard manure and composts are skilfully prepared the loss of ammonia is very slight, even without the use of fixing agents."

In our articles, however, we recommended the construction of a large tank for the reception of the drainings of the yard. Into these drainings as much sulphate of lime or plaster was to be thrown as they would dissolve. The reason of this was that sulphate of lime in solution will convert the volatile carbonate of ammonia into the fixed sulphate of ammonia, while it will not do so in its dry state. This solution of sulphate of lime, when pumped back again in dry weather, not only serves to check excessive, injurious fermentation, but it converts the carbonate of ammonia in the mass into a fixed sulphate, and thus renders the loss of ammonia from volatilization almost impossible. We still think this method equal to any other we have seen suggested.

Professor Wolff recommends substantially the same process; he thinks the drainings of the tank should be pumped back upon the mass, and that they would be improved upon by adding green vitriol, (sulphate of iron) or, where this is costly, dilute sulphuric acid, or even plaster of Paris to the collected liquids in quantities sufficient to fix their ammonia, which may then be used to drench repeatedly the solid portions. In this country, plaster is decidedly the cheapest substance that can be used for this purpose. Professor Wolff says, "in England sulphuric acid is preferred." This may be so theoretically,

but the *practice* is not at all general. In fact we have never seen it used except in more than two cases—Meechi, on his Tiptree farm, and the Royal Agricultural College at Cirencester, and this while sulphuric acid is cheaper, and plaster much dearer than with us.

As showing the extent to which ammonia may be lost when common liquid manure is allowed to ferment, unmixed with the fixing agents, the experiment of D. Krutzsek is quoted. He found that the solid residue remaining after the evaporation of perfectly putrid yard liquid, gave 3½ per cent of ammonia; while the same liquid, treated with an acid (fixer) before evaporation, gave a residue which contained 12½ per cent of ammonia. In the Rothamstead experiments, if we recollect rightly, sheep urine, evaporated without acid, lost even a still greater amount of ammonia.

Yet we should be careful how we apply such results to common practice. It is known that water will hold a large quantity of ammonia, and we believe the loss of "this spirit-like essence of the farm, ever struggling to be free" from fermenting, common barn-yard drainings, is vastly less than the above figures would indicate. Yet it is sufficiently great to warrant the use of any cheap method of fixing it, such as the one we have suggested. [Rural New-Yorker.]

For the American Agriculturist.

NO TIME TO READ.

IN distributing those extras which you gave to me the other day, I presented them to such persons as were reputed able to pay for and read a paper. I had good success in the distribution, and it will be a strange incident if no fruit is gathered from so much good seed sown. The recipients were thankful for the favors, with but one exception—and this was a person with profitable investments enough to support himself and family without labor; yet he returned the paper without so much as unfolding it, and with a most chilling expression of countenance said: "I don't want a paper, for I have no time to read." I took the paper back, for the soil appeared so shallow and dry, that the germination of seed was doubtful, and as to ever expecting fruit where the rocks were so completely unbroken, I concluded it a very absurd idea. For a person to excuse himself from the pleasure of taking the *Agriculturist*, or any other paper, upon the ground that he has *no time to read*, appears to me to be equivalent to an admission that he is a bondman, although he is able to command the benefits and comforts of civilization. What a miserable life he must hereafter lead! He has toiled to amass a competence which gives him no time to read! I could not help musing upon the idea of what a poor solace it would be to civilization, if "no time to read" were the inevitable result of industry and frugality.

Man would have made but little advancement in the arts or sciences, or even in civilization, if he had never had *time to read*; for by reading he learns the advancements made and the errors committed by former generations. The histories of their errors and successes, are the guides by which he may avoid the one, and the incentives by which he tries to excel in the other, so that each subsequent generation grows wiser than the former.

What a miserable lot must be that of the man who has *no time to read* of the creation of our globe; of man and his subsequent life; how his descendants were scattered over the surface of the earth, so that, at the present time, not a nook is unknown to him! Go where he will, he finds his own species, and he finds them elevated in happiness, or

degraded by misery in proportion as they can and do take *time to read*.

It was by reading that Columbus was first led to make his great voyage of discovery, and it was by taking time to read the history of that and subsequent voyages that the inhabitants of the Old World were induced to seek homes in the New. It is by reading that we have become a great, enlightened, and happy nation; and by reading we are known to other enlightened nations, and our citizens respected. By reading, too, of our greatness and happiness, the people of other nations are stimulated to seek an asylum among us—not because we have a more fertile soil, or a more sunny clime, but because we have learned how and took *time to read*.

What would be the result, if every farmer in these United States were prohibited from reading the newspapers, only for one year? While it would be next to impossible to estimate the loss to those interested, it is clear that the farmer would suffer in his pecuniary affairs largely. He would not know the value in market of a single article he wished to purchase or sell, and thus he would be compelled to pay double or sell for half price in many cases, or else he would have to spend much time to inquire as to the market-value of whatever commodity he wished to deal in.

Lest you should not find *time to read* much more, I will close, by merely saying, that while I have found but *one* who had no *time to read*, I have found several who, while they have *time to read*—when that is all that it costs them—yet they are too penurious to pay for a paper, of any sort, and read as their own. It is *then* these have no *time to read*.
A READER.

WINTER LABORS ON THE FARM.

UNDER the head of "A word to Farmers," we find in the Tribune of the 25th ult., the following article, which contains some good suggestions, and we transcribe it entire:

We are evidently on the verge of a hard winter for the poor. Food and fuel are dear, and likely to remain so, while most Railroads are either finished or stopped, and few public works will be in progress after January 1st. Foreign fabrics, wares, and metals continue to pour in upon us at the rate (for the whole country) of over three millions of dollars' worth per week, though it is manifest that our exports, except of specie and promises, can not nearly balance that sum. It is hardly possible, therefore, that building should not fall off, and all enterprises which depend on Bank facilities or loans of any kind should not be reduced to their lowest dimensions, bringing want and distress to the hearths of too many of the laboring poor.

We appeal, therefore, to the farmers, as in the main the most thrifty and independent class in the community, to come to the rescue of the unfortunate. Many farmers have secured good harvests; nearly all have obtained or can realize satisfactory prices. Unlike almost everybody else, a majority of farmers can show a balance on the right side of the ledger as to the net results of the doings of 1854. Very many will have from one hundred to two or three thousand dollars' surplus over the year's outlay, to be carried to the account of clear profit or realized earnings for the year.

We entreat these to consider whether duty and interest do or do not combine to suggest the investment of this surplus in substantial and permanent improvements, giving employment to labor. Many have old fences that need renovating, (where they can not be dispensed with;) and have lands that need

thorough plowing and subsoiling; and every farmer should do something at draining. We know how general is the belief that none but lands usually too wet need to be drained; and that only lands that bear high prices will justify the expense; but these are both mistakes, as ample experience attests. There are two thousand acres of swampy, boggy lands in Westchester County alone that could be thoroughly and lastingly drained at a cost of less than \$100 per acre, and would then be richly worth \$200 to \$300 per acre, whereas they are not worth the taxes—not worth the cost of fencing them. Almost every farmer has some such land, which now yields only frogs, bulrushes, alders, ague, mud-turtles and musketoos, yet which, properly drained and cultivated, would yield eighty bushels of Indian corn, or three tons of hay per acre. How much longer shall these, our richest and most durable soils, be permitted to lie worse than useless, when corn is worth a dollar per bushel and labor is vainly seeking employment and bread?

But there is little land in the old States worth plowing which will not pay for draining and subsoiling. Dry soils need these meliorations quite as much as wet, and will as richly reward them. There is no tolerably good land in this State so dry that it might not, by under-draining and deep plowing, have been made to stand the drouth of the past summer without rolling a single blade of corn. Proper draining moistens land when too dry as much as it dries it when too wet. These facts are well known to the decently instructed farmer, and we need not dwell on them.

What we aspire to is not to tell the farmers what to do, but to urge them to do something. If each one who has the means will resolve to keep one, two, or more laborers at work through the winter, he will be doing a truer charity than by supporting so many families in idleness by almsgiving. To find work for the industrious, deserving poor, is to save them not alone from want but from degradation; to preserve not only their lives, but their self-respect and courage. Let every farmer who can, therefore, resolve to keep some laborers at work through the winter, and not turn aloft when the harvest is gathered to wear out the inclement season as they may.

There is no longer any lack of laborers wishing to be employed. You can find them in almost any township; or if not, there will henceforth be thousands of them vainly seeking work in our City. Any neighborhood by sending an agent here may hire as many as may be wanted on reasonable terms forthwith. Farmers! give the poor a chance this hard winter!

KEDZIE'S RAIN WATER FILTER.

TAKE an oak cask or barrel, that is sound, sweet and clean; bore an inch hole near the bottom of one side, into which insert the end of a piece of $\frac{3}{4}$ inch lead pipe, ten or twelve inches long, the other end projecting inward and bent upward from the bottom of the cask, and in the other end place a common beer faucet or stop-cock, from which to draw water as desired. Have ready say one bushel of good hard wood charcoal, and the same quantity of clean, fine gravel—not limestone—from the fineness of coarse sand, up to the size of peas, and if not clean, wash it till no dirt will appear in the water. Break the charcoal to the size of walnuts and smaller, then mix it evenly with the gravel; next cover the bottom of the cask three or four inches thick with its mixture, pounding it down firmly. Next take a clean garden flower pot, of large size, say two gallons, and place it bottom upward in the center of the barrel, on top of this layer of grav-

el and coal, and over the end of the lead pipe. Then take a piece of small sized $\frac{1}{4}$ or $\frac{3}{4}$ inch lead pipe, and place one end firmly into the hole in the bottom of the flower pot, now uppermost, and bring the other end through a hole near the top of the barrel, for the purpose of admitting air into the space under the flower pot. Now fill in the space around and above the flower pot with the mixture of coal and gravel, pounding it firmly down as you proceed, till the cask is about three-fourths full; then place some thin flat stones, not *limestones*, on top, and the filter is complete. The water being poured in on top, passes through the gravel and charcoal, by which it is purified, and enters the chamber, from which it is drawn by the stop-cock or faucet, as required; the small pipe admitting air into the chamber to supply the place of the water while it is being drawn out.

BAKED BEETS.

A good housewife assures us, that the mode of cooking beets herein described, is preferable to all others:

"Beet root can not be too much recommended to the notice of mankind, as a cheap and salubrious substitute for the now failing and diseased potato. Hitherto the red kind has been only used in England as a pickle, or as a garnish for salad; even the few who dress it, generally boil it, by which process the rich saccharine juice is lost, and the root consequently rendered less nutritious by the quantity of water it imbibes, as well as by parting with the native syrup, of which it is thus forcibly deprived; it is, therefore, strongly recommended to bake instead of boiling them, when they will be found to afford a delicious and wholesome food. This is not an untried novelty, for both red and white beet root are extensively used on the continent; in Italy, particularly, they are carried about hot from the oven twice a day, and sold publicly in the streets; thus they are purchased by all classes of people, and give to thousands, with bread, salt, pepper and butter, a satisfactory meal. There are few purposes for which baked, or even roasted or fried beet root, would not be found preferable to boiled." [Author Unknown.]

WESTERN HOG TRADE.—The Nashville Journal of the 24th inst., says, the packing season is rapidly approaching, and our country readers wish doubtless to know something about hogs. There is nothing doing, however. Packers, under present circumstances, with a tight money market and large stocks, and great depression in prices of last year's product, are loth to enter the market at the rates now demanded. The crop, it is now generally admitted, will not show so large a deficiency as supposed some time ago. We are confident, however, that no sales could at present be effected at over \$4 50 net.

The Alton Telegraph says: "We hear it rumored that five thousand hogs have been contracted for at Springfield, Illinois, at \$3 50. The represented seller is a packer of that place."

She St. Louis Intelligencer says: "Here packers talk of \$4, and so far as we have heard an expression of opinion, none calculate that less than this will be paid at any time during the season. A drover was in the city yesterday, offering to contract 1,000 or 1,500 head at \$5, but found no buyer."

At Cincinnati \$4, net, is offered.

It is now 114 years since the Methodists have existed as a people, and they number in the world nearly two millions of communicants, and preach the gospel to ten or twelve millions.

Horticultural Department.

THE HORTICULTURIST FOR OCTOBER.

THIS excellent monthly reached us in good season, with a table of contents rich and varied, as ever. There is a fine engraving of the *Easter Beurre Pear*, with remarks, by the editor, upon the cultivation of Winter pears. He deprecates the general neglect of these pears, even among amateurs. Not one in thousands, of those who have gardens, has tasted a fine Winter Nelis, a Lawrence, a Beurre d'Arenberg, a Glout Morceau, or an Easter Beurre; yet these are all delicious, melting pears, that will ripen in a good, dry cellar without any extra care or attention whatever. This is good news to young cultivators, who have not yet had the opportunity to test these varieties. We were aware of the excellent keeping qualities of the Beurre d'Arenberg, but had supposed the others needed a fruit-room to preserve them.

The Easter Beurre is pronounced the finest of all the long-keeping varieties. It succeeds as well here as in France or Belgium, and it is surprising that it is no more generally cultivated. We noticed that it was up for discussion at the meeting of the Pomological Society of Boston, and while many had succeeded well with it, others found some difficulty in ripening it. It sells in the Boston market for from \$3 to \$6 per dozen. It is much better on quince than on pear stocks, the latter not furnishing nutriment enough to bring them up to the most perfect state. The tree is a good grower, moderate at first, but improving every year, and finally makes a large, vigorous tree on the quince, and, if kept under high culture, will produce annually very heavy crops.

The editor has another seasonable article, "On pruning trees at the time of transplanting." The objects are said to be three-fold: 1. The removal of bruised and broken roots and branches. 2. To mold the tree to the desired form. 3. To restore the balance between roots and branches disturbed by removal. The great object in pruning to promote growth is, to direct the sap into a smaller number of channels, and thus increase its force. If a tree, for example, has 500 leaf-buds to draw upon its sap, and we cut away 400 of them, the remaining 100 will, of course, receive a far greater proportion than they would have done, and will consequently be enabled to make new wood; and experience teaches us that the young shoots, with their large cells, luxuriant leaves, and great vital activity, act far more powerfully on the roots than the small, lean foliage of trees merely living but not growing. There is a philosophy in pruning, and the man who wields the pruning-knife upon the young trees he plants this Fall, should be able to give a reason for the faith that is in him.

THE NEW-ROCHELLE BLACKBERRY

Is judiciously recommended. One caution dropped in this article is worth remembering. "No one need expect such wondrous large fruit, however, as people have seen at New-Rochelle and Norwalk, in ordinary soil, and with ordinary culture. Manure must be ap-

plied unsparingly, and the ground must be kept clean and friable as work can make it."

GRAPE CULTURE UNDER GLASS.

This article is by a gardener, of Baltimore, and, we think, his objection to borders inside the glass, is not applicable to our northern States. In all the graperies we have visited, the inside border was present, and we have never observed the shriveling of which he speaks, in any well kept vinery. An article on

GRAPES AND ROSES

Recommends the Clinton grape for latitudes where the Isabella is uncertain. It is a moderately good grape, and hardy. It recommends growing Catawbas on walls facing the South, which will hasten their ripening two weeks. It speaks of chip manure as the best fertilizer for the rose.

THE HOLLY TREE

Is declared the most beautiful of our native evergreens, taking shape, color, form of leaves and berries into consideration. It may not be generally known that there is a locality of these evergreens, near Absecon, in New-Jersey. Some of them are undoubtedly more than a century old, and growing close to the sea-shore, exposed to all the fury of the north-east winds, they have been blown into fantastic shapes at the tops, but have firmly resisted the awful storms which make that coast the dread of the mariner.

In the Editor's Table there is an interesting notice of the American Pomological Society at Boston, the proceedings of which have already been reported in our columns. The calls around Boston, at M. P. Wilder's, Mr. Strong's, Mr. Breck's, Hovey's, &c., contain much useful information. Mr. Wilder gives himself very much to pears, and probably has the finest collection in America. Mr. Strong makes a speciality of the grape, and has three vineries, each one more than 200 feet in length. He sends 3,000 pounds to market this season. The early crop, from the forcing-house, usually sells at \$2 a pound, and the autumn crop at 50 to 75 cents.

TRANSPLANTING TREES IN AUTUMN.

The editor approves of this:

1. When the ground is such that the water will not lodge around them in winter.
2. The trees should be perfectly hardy.
3. Evergreens should not be planted at all.
4. All trees should be planted early—as soon as the wood is ripe.
5. Secure all trees from being blown about with the winds, and mulch with half-rotten manure or leaves, three or four inches deep. These hints are timely, and accord with our own experience.

[For the American Agriculturist.]

WINTERING APPLES IN A HAY-MOW.

ABOUT twenty years ago, having cut with a scythe and removed the hay to the middle of a mow about ten feet in diameter, I placed in it a barrel filled with small, hard, late-ripening apples, and packed the hay well around and above it, in November. When the apples were taken out, in April, there were not a dozen of them decayed in the least degree. They had lost a little of their plumpness, but not to injure them, and were free from any flavor from the hay.

This experiment was made in New-Hamp-

shire, and probably might be successful in any latitude.

D. D. S.

CINCINNATI, Oct. 23, 1854.

CURCULIO REMEDIES.

WE are not able to inform our correspondent, at Newman's Mills, Penn., what Mr. Matthews's remedy for the curculio is. We suspect, however, that it will turn out to be something not less difficult of application than the following, which we clip from the Country Gentleman. This thumb and finger remedy is the only one that we have any confidence in, and this we believe to be effectual. Two minutes to a tree, in a season, is certainly not a very large outlay of time, to save a crop of fine plums. If a man thinks this is too much, he does not deserve any plums. We have never found any other way to grow fruit of any kind, but to attend to it in season. If Mr. Parsons's suggestions are followed out, we have no doubt that our correspondent will save his plums. The great trouble with us all is, that we grudge the time, patience, and money needed to grow the best fruit. We trust he will try this remedy and report.

I furnished myself with a cloth three yards by two, of the cheap, white cotton, and a stick about three feet long, with a piece of an old rubber shoe fastened to one end to strike the tree or limbs, if large. Equipped with these materials, and a small boy to hold two corners of the cloth, I held one in my left hand, and the other I fastened around my neck with a string. I took the stick, to jar the trees, in my right hand. I continued to destroy them in this way, from time to time for some four or five weeks with a good degree of success, until I had slain more than fourteen hundred of these destroyers, on about one dozen trees. I likewise caught some curculios on a few cherry trees near by, for I found they were not very particular whether they were plums or cherries. The result of this labor was, I had two bushels of fine plums from my Washington trees, and all my other trees bore profusely. I have continued this practice of destroying these insects, and have saved my fruit ever since, until the present time. But the best part of my story is, this plan has worked so well that I have comparatively little labor to perform, as they have mostly disappeared from my garden.

My plan is to begin to search for the insect when the plum is about as large as a marrowfat pea, and continue to take them as long as they are plenty, which generally lasts about three weeks; but they do their work of destruction mostly in a very few days. I have known them to destroy more fruit in one warm still day than all the rest of the season together; but as we know not when they get fully organized to do their mischief, we must watch for them. I search my trees twice or three times a week at first, but as they grow plentier I search the oftener, and at the time they are to be found in greatest numbers, I go over my trees two or three times a day. There is no danger of them in windy weather, that is when it blows quite fresh; and in cold rainy weather they move but little. I have never seen them fly far, yet I believe they emigrate some, but comparatively do little damage, if we are faithful to look after them and destroy them.

I say understandingly, that if any man will spend two minute's time, on an average, for each tree in a season, he will surely save his fruit. In fact, I have faithfully jarred two hundred trees, when the insect

was plenty, in twenty minutes, my son holding the watch while I with a small boy performed the operation. After I have gone round my trees, I open my cloth and destroy the bugs with thumb and finger, which has proved very effectual. I have tried all nostrums of the day and found them ineffectual. I have taken the worm from the plum, when but a few days old, and placed him in fine salt, in strong brine, in vinegar, and the like, and examined him with good glasses for some time, but he would not die until the application of thumb and finger, which has always proved efficient.

I believe I have killed more trees with salt than insects.

Last year my crop of plums would have been from 75 to 100 bushels, if it had not been for the heavy rains in August and September, which caused many of them to crack and rot on the trees.

I send you the number of insects taken each year, from 1847 to 1853. I could have told you how many I took each day, if I had thought it to have been interesting, for I have day and date of every day's work.

In 1847 I began operations June 1st, and ended July 14th, and caught, on about a dozen trees, 1,421 curculios.

1848—May 15th to June 28th caught	945	do.
1849—June 4th to June 20th	975	do.
[This year, 1849, I had some 50 trees come into bearing.]		
1850—June 3d to June 26th	209	do.
1851—June 3d to June 25th	229	do.
1852—June 4th to June 24th	320	do.
1853—June 1st to June 16th	864	do.

This year, 1853, I had quite a number of trees that came into bearing in a part of my garden where plums were never raised before, which probably was part of the cause of my taking so many more this year than the year before, and another reason I think, was the mild winter of 1853, which was favorable for them, as they were more plenty throughout this region than for some years before. I believe that, until a way is found out to exterminate them entirely from our gardens, the jarring plan will be found most effectual, simple, and economical way to destroy this little, but formidable pest of our gardens.

Before concluding, I wish to inform you how I cultivate my plum trees. My plan is to set them twelve feet between the rows and six feet in the rows, and prune severely and cultivate highly. By so doing, my trees are not large, but full of bearing wood within two feet of the ground, and from six to eight feet high, and I have every advantage in reaching for and destroying the cureulio, which you will find to be the saving of a good deal of time, and on such trees you will have more and finer fruit than on larger ones. I prune my plum trees in July, and have a second growth the same year. Yours respectfully,

JOHN PARSONS, JR.
ROCKPORT, Mass., Feb. 1854.

MULCHING WITH WOOD SHAVINGS.

MR. EDITOR: Never having seen anything written on the subject of mulching fruit trees with wood shavings, I venture to suggest to such of your readers who have young orchards, the propriety of trying the experiment.

Having had but two years experience, I am not prepared to say they are better than any other material, but I am free to confess they have thus far surpassed anything I have ever tried.

Having a few fruit trees set on a barren knoll, which, although they had yearly received a liberal mulching with grass, assumed the appearance of premature decay, and, in fact, had already taken the down hill course, I resolved to try the effect of mulching with shavings. Around each tree I put two barrels of shavings, within a circle of eight feet in diameter, leaving a small space between the shavings and the tree to be filled with

fresh earth. To keep the shavings snug, a thin coat of grass was spread over the whole. To fully test the experiment, a part of the trees were treated the same as they had formerly been. After the lapse of one year, (which was last year,) those trees mulched with shavings put out vigorous shoots, and their dark green foliage could be easily distinguished from the others at a great distance. So well satisfied was I with the result, I last year used upward of a hundred barrels, which has proved equally as beneficial to the trees, while the first I mulched continue to thrive even beyond my expectations.

If any of your readers have used the above named material, I hope they will communicate the fact, and state with what success.

I have found brush from evergreen trees to be an excellent material for mulching young orchards.

E. HERSEY.
[New England Farmer.]

HINTS ON GRAPE GROWING.

BY A COUNTRY GARDENER.

THE importance of bestowing care in the formation of the borders, in which the vines are to be planted, rather than waste money in making the house ornamental, was pointed out in a former paper. A good border is certainly the greatest help toward obtaining grapes. I have in my time superintended the making of many, and have seen many others made, and the recommendations now given are based on practice derived from experience; for, after all, what constitutes a good border is still a problem not satisfactorily proved with many. There is one opinion strongly rooted in the minds of the non-professional grape growers, viz., that a vine border must consist of a goodly proportion of rotten dung, butcher's refuse, or dead ear-cases, bones, and the like; for, say they, the vine will grow on a dunghill. And we have very frequently witnessed the enthusiasts in vine culture putting dead carcases to the roots of some favorite vine, with the hope that next season the vine will be forced by such an extraordinary stimulant, and produce something prodigious in the way of grapes; and I have been oftentimes asked how it was, after so and so had been carefully put to the roots, no better results had been obtained? Now it is very difficult to persuade people on points referable only to laws based on the physiology of plants; and therefore the short answer I give for prudent motives, "Wait and see another year," is perhaps the best. I may now state that all the ingredients enumerated are useful enough in the hands of the skillful gardener (though not indispensable), but in nine out of every ten cases which have come under my observation, they are, in the hands of the amateur, productive of more mischief than aught besides. What the vine really requires was stated in my first paper, but it may not perhaps be amiss to look at the matter again.

It is a mistaken notion that the vine grows best in the richest soils; on the contrary, the sloping sides of mountain ranges, and dry gravelly or rocky soils, are proverbial for producing the richest grapes and the most durable trees. In the East, where the vine is indigenous, the soil is usually shallow, resting on a rocky substratum. To improve the size of the fruit, manures have from time immemorial been employed; but then, we must remember, the nature of the subsoil—affording complete drainage—and a climate producing a much more rapid evaporation than our own; hence, in warm latitudes, a soil much richer than any we ought to employ may be used. This was Mr. Hoare's theory, but he carried it too far. As the future welfare of the vine will, then, in

a great measure depend on the drainage of the soil in which it grows, the formation of the border must be such that water should pass freely through it, without any detention whatever; and to insure free evaporation from the surface, the border should be somewhat elevated above the surrounding soil. Gravelly, and rocky or chalky bottoms, if free from springs, form the best natural subsoil for the vine, on which the border may rest, with merely a drain along the front, and below the bottom, to carry off any water which may percolate to the lower level. But, when an artificial subsoil has to be made, I strongly recommend having it paved with rough flagging, if such can be obtained at a reasonable cost. To carry this out properly a space should be cleared, the width of the border, which, considering the houses are narrow, and that two feet of the border will be inside, need not be more than nine or at farthest ten feet from the front. I purpose the border to be two feet deep; and to allow for the supporting walls and flagging, two feet more will be necessary. This bottom should be made to slope upward toward the house, and should be made firm, to carry the dwarf walls without danger of their sinking; if wet, concrete the surface with hot lime, gravel, and coal ashes; this will cut off all connection of the roots with damp. One foot below the level of this prepared bottom, a main drain must be carried along the front of the border two feet square; next, run rough walls as wide apart as will carry the flag-stones; these should run from the main drain, direct to the extent of the border inside the house, where, if possible, the end should be left open. Carry them up one foot in height, and on them place the flagging, beginning at the bottom, and proceeding upward; these need not be placed exactly close together, neither will it matter, if they vary in size or thickness; smaller pieces can be put in between, where wanted, and two or three inches of broken rubble should be placed over, which will then be ready to receive the soil. It will be evident no water can lodge in a border placed over so thorough a drainage, and the passage of air underneath, from the main drain to the house, will assist in removing any dampness below. I have been thus minute in describing the drainage necessary, unless, as alluded to above, the natural drainage is perfect, owing to the nature of the subsoil. If the house is a detached one, a dwarf wall at the ends will be required—or, what will answer the purpose as well, with a less stiff appearance, the soil of the border may be kept up by a piece of low rockwork.

The best way to prepare the soil will be to obtain some turf three or four inches thick from a pasture field or common. Neither turf from strong clays nor sandy soils are good, loam of a medium texture being best; neither should it be obtained from low wet situations, but from sound dry land. This, when procured, should be stacked up with fresh horse-dung, or with that combined with cow and pig dung, using the latter more largely, if the loam is of a light character; to these add a portion of scavenger's manure, which always contains fertilizing matter, and more or less of sand and grit. Old mortar may be used or not. These ingredients should be stacked up in layers; the heap will soon heat, from the mixture of fresh manure, and this will help to decay the turf, and bring it into a state fit for use. The heap, when it gets cold, may be chopped down and turned over once, when it will be fit for use. As a guide in mixing, let three parts be loam, one manure, and one rubble materials, including road grit, town sweepings, or old mortar. Mind, never allow it to get saturated with rain, nor yet break it down too fine.

[London Florist.]

American Agriculturist.

New-York, Wednesday, Nov. 1.

LECTURES ON AGRICULTURE TO BE GIVEN THE COMING SEASON.

DURING the past few weeks the subscriber has received numerous invitations to Lecture during the coming Winter; as well as inquiries when, how often, and on what terms, &c., such lectures could be given. To answer these inquiries, and others which may be made, I will state, once for all, that my time is wholly devoted to securing the best interests of the *American Agriculturist* and its readers, and I have no present intention of lecturing for any specific pay.

Believing, however, that it will be highly advantageous to every farming community to get together during the winter evenings and converse with each other, and, when practicable, have an address or familiar discourse upon some agricultural topic, I shall cheerfully give my services, on any such occasion, free of any charge further than what may barely pay necessary traveling expenses to and from the office. Such lectures will embrace a familiar discussion of some of the more important and interesting topics, relating directly to common farm operations. Evening lectures will be adapted to a general audience, both of ladies and gentlemen; and, when practicable, a day-lecture will be given in connection, to gentlemen only, to discuss more particularly the subject of animal manures and fertilizers.

These lectures are designed especially for readers of the *American Agriculturist*, and on this account my services will first be given to those towns where we have the greatest number of readers. As I can usually occupy in this way two or three days in each week, from early in November to the first or middle of April, I think a lecture can be promised in each town where there are fifteen or more subscribers to our paper. It will not be necessary for all the subscribers to be at the same Post-office, but only that they reside in reach of the place of lecture. The preference will be given, on application, to those towns now having, or first pledging, the above or a greater number of subscribers. Any communication relating to this subject may be addressed to me at the Office of this paper.

ORANGE JUDD,
Of the American Agriculturist.

JAPAN PEA OR BEAN.

WE have just received from Mr. George Haywood, of New-Rochelle, a stalk of this new pea, or, as we should term it, bean, since it more resembles the latter. This can be examined, in our office, by those interested.

This stalk is about an inch in diameter at the bottom, is about 2½ feet high, with branches upon two sides only—east and west, in the growing position. We counted on this one stalk 308 pods, containing two and three beans in each, in all somewhat over 700. Some others have raised twice this number

from one stalk. Mr. H. informs us that he planted it in ordinary soil, well manured, in the latter part of June. They should usually be planted much earlier.

GUANO AND GOOD EARS.

AN old farmer, after harvesting an extra crop of corn, by the application of some of the above *new-fangled* manure, meeting with one of his "old foggy" neighbors one day, put on a very serious countenance, and thus accosted him:

"Well, Dea. Slowgog, I want to sell you six of my hogs. The truth is, I have no corn to feed them with, because—"

"There; I knew it would be so. I told you last Spring you was a fool, expending your hard-earned money in buying humbugs, guano, and all sich. The fact is, Squire, them things don't pay, and I'm glad you've found it out."

"Hold on a minute, Dea., until I finish. The truth is, I have usually had poor corn enough to fatten my hogs, but what you call humbugs, have, this year, given me fifty bushels, of perfectly sound corn, to the acre, on the same ground that last year yielded but ten of sound, and thirty of unsound; and so I thought I would sell my hogs, and buy some more humbug. Out of compassion to you, Dea., I will sell them to you, so that you can turn your ten acres of *nubbins* to some good account."

The Dea. smelt a heretic, and turned a short corner. He has hardly had courage to mention *guano* since.

SOME FINE HONEY—SIMPLE AND EXCELLENT PLAN OF PREPARING IT FOR MARKET.

MR. QUINBY, of Palatine Church, N. Y., the well known author of the "Mysteries of Bee-Keeping Explained," has just placed before us a sample of honey, in the form in which he sends to market some 4,000 lbs. a year. It is in a neat glass box, six inches high, six inches wide, and four inches deep. The four sides are of glass, and the top and bottom of wood. The corners are simple square strips, with saw grooves to admit the glass sides. These cases are easily made, and can not cost to exceed 10 or 12 cents. A small opening is made in the bottom, for the entrance of the bees, and these cases are then set together upon the top of a common box hive. As the bees prefer to work in the dark, another box is covered over the whole of those placed upon one hive.

These cases can be made of any required size; the smaller the size the better for retailing, as well as for transporting. In the box before us the honey is deposited in two combs, just fitted for removing to the table without cutting or breaking. If not too strongly tempted to *try* the quality, of which we have no doubt however, we shall keep this box on our desk a short time for the inspection of the curious or the interested. Every thing considered, we think this form of honey-box one of the best and cheapest for general use, especially as it can be put upon any common hive, and the crop

can be gathered as fast as produced, without at all disturbing the bees.

LABELING TREES.

WE have been, to-day, in a gentleman's fruit yard to assist him in determining the names of his pears. The trees were dwarf pears, set out by his predecessor, some fifteen years ago, and were now in full bearing, yielding splendid fruit. Our correspondent, who was inquiring for the success of dwarf pears some months ago, is informed that these are entirely successful, and give no indications of decay. In the vicinity of Boston, we are told, that they have dwarf pears, at least forty years old, that are as vigorous and fruitful as ever. The best informed and oldest cultivators in that vicinity, have no doubt of their success, and are planting them as largely as ever.

The most of this gentleman's collection proved to be the Buffam pear trees—a fruit of Rhode-Island origin—a seedling of the old White Doyenne, which it resembles when in its perfection. Here also were the Lodge pear, the Flemish Beauty, the Duchess d'Angoulême, Knight's Monarch, and Henry IV—a very small pear, but of sprightly flavor, and, when ripened in the house, said to be first rate.

Multitudes of fruit yards are in the same condition with this, the fruit labels gone, and their owners ignorant of the names of their fruits. It may be that a pear will taste as well by one name as another, yet there is a great satisfaction, to most men, in knowing the names of their treasures. It certainly makes a fruit yard much more valuable to the public, as thousands of scions may be sent out from it, correctly marked, that otherwise might never be called for.

As the time of tree-planting has already come, it is a favorable season to attend to the new labeling of trees. Remove all the old labels, from the trees set out last Spring or earlier, and provide zinc labels, about three inches by one, and mark the names of your trees upon them, with an indelible ink, prepared from the following recipe:

One drachm verdigris, 1 drachm sal ammonia, ½ drachm lampblack—all finely powdered; mix thoroughly in ten drachms of water. Shake it well before using. This forms a beautiful indelible ink, which will bear years of exposure to the weather.

It is an excellent plan to have a map of one's garden, and orchard, with every tree put down in its place, and correctly marked upon paper. This can be resorted to, when the labels are lost, and can be conveniently handed over to your successor, in case it becomes necessary at any time to change your location.

AGRICULTURAL EDITORS IN DEMAND.—We notice that our cotemporary, Jas. W. Grimes, of the Iowa Farmer, has been elected Governor of that State. Simon Brown, of the New-England Farmer, has been nominated by the Know Nothings as their candidate for Lieut.-Governor of Massachusetts. These are cheering indications of the rising fortunes of the noble art.

NATIONAL CATTLE SHOW.

Editorial Correspondence.

SPRINGFIELD, Ohio, Oct. 24, 1854.

THERE is a great show of cattle here, especially of Short Horns. Ohio and Kentucky are particularly well represented, while Indiana, Illinois, New-York, and other States, have contributed more or less of their favorite breeds of animals.

The show-yard is spacious and well arranged. It is nearly all an open grove, with carriage-paths cut through it in different directions. It belongs to the Clarke County Agricultural Society.

It rained yesterday, but has cleared up today, and the weather now promises fine. A large number of persons are in attendance already. To-morrow and next day it will be most numerously attended. I shall write in full as soon as it is over, which I fear will not be in time for our publication next week. Our readers, however, will have it in the next issue.

RARE FOWLS.—Two weeks since we alluded to a lot of fowls on their way to this country, which had been purchased in Europe, for Mr. Barnum, by Mr. Giles, of Woodstock, Conn. These arrived last week, and are now on exhibition at the American Museum in this city. We looked in upon them on Saturday, and were quite interested. There are a number of pairs of pure bred Black Spanish fowls, English pheasants—one of them white—Chinese Golden pheasants (seven pairs), two pairs of magnificent white European swans, Barnacle geese—white-faced—Surrey fowls, Gold-laced and Silver-laced Scabrights, &c.

Among the rare fowls, few of which have been seen in this country before, are Mandarin ducks, Widgeon ducks, Little blue dippers, Green-winged Teales, Egyptian geese, Shell drakes—with curious Roman nose bills—Japanese Pea-fowls, and the Spoonbills, which are also rare and are quite a curiosity. These fowls, taken together, are really worth examining, and as they are to be on exhibition but a few days, we advise those interested to call early and see them.

WE desire to call attention to Mr. Kelly's advertisement, in this week's paper, of a Short Horn bull. Prince Albert is a noble animal, individually, and he comes from first rate milking stock, which is a matter of great importance with Northern and Eastern farmers.

EXPERIMENTS WITH POTATOES GROWN IN TAN, &C.

WE elip the following experiment from the Practical Farmer. If any of our readers have the curiosity to compare the results of tan on potatoes, with those of peat on potatoes, in our experiment, published a few weeks since, they will see that tan does not pay so well as peat. No. 5 only shows an increase of three pecks, in a product of four bushels, for the use of the tan, and No. 7 only gives an increase of two pecks. In our experiment, peat gave more than twice the product of guano. We have no doubt that

tau is a valuable article, but it can never be made largely available for farmers, on account of the very limited supply. But peat and muck are inexhaustible; and we have no doubt that either of these, thrown up and exposed to the frost through one winter, would give better results on potatoes than bark. The experiments alluded to are recorded in the following article:

In compliance with your request, I forward the following facts, relating to my experiment in the cultivation of potatoes. Had I anticipated any thing like the result that followed, I should have noted the facts with more particularity.

In 1850, the ground was planted with corn and potatoes. Part of the potatoes rotted. This year it was laid out in squares, fourteen paces each way. A small coating of barn manure was spread, after plowing, and harrowed in.

Lot No. 1.—The potatoes were covered with salt hay, about six inches thick, over the whole square. Yielded four bushels.

Lot No. 2.—The potatoes were covered with slaked lime, then covered with soil, then spread half a bushel of salt over the square. Yielded four bushels.

Lot No. 3.—The potatoes were covered with soil, then a coating of lime on top. Yielded four and a quarter bushels.

Lot No. 4.—The potatoes were placed in the hills on the lime, and then covered with soil. Yielded four and a quarter bushels.

Lot No. 5.—First put a shovel full of tan in the hill, then the potatoes on the tan, and covered with soil. Yielded four and three-quarters bushels.

Lot No. 6.—Put a shovel full of barn manure, from the stall where my oxen were kept, and covered with soil. Yielded four bushels—the poorest lot in the field.

Lot No. 7.—Dropped the potatoes, and threw a shovel full of tan upon them, and then covered with soil. Yielded four and a half bushels.

Lot No. 8.—Dropped the potatoes and threw a shovel full of meadow mud upon them, and then covered with soil. Yielded four bushels.

Lot No. 9.—The same as No. 8, with the potatoes dropped on the mud. Yielded four bushels.

The potatoes in Nos. 5 and 7 were up a week before the others.

In most of the parcels, except where the tan was used, there were found more or less of defective potatoes. Those that grew in tan were larger, smoother, and of better quality than the others. I have grown no better potatoes than these this season. I am so well pleased with the operation of the tan, that I shall try it more extensively another season, and with other crops. I used several kinds of potatoes. The quantity of seed in each hill was nearly the same; the manner of hoeing and treatment the same throughout. I am sorry not to be able to state the facts with more precision. But if any one should be induced to imitate my example, I hope they will be instructed by the experiment. I certainly have been.

WILLIAM SUTTON.

GROWING FISH.—The Cleveland (Ohio) City Fact says that one of the most pleasing things exhibited at their late County Fair was a lot of brook trout, artificially bred by Drs. Garlick and Ackley, whose labors in this line we have heretofore noticed. They showed several broods of fish, in different stages of growth, and have demonstrated that it is just as easy to grow fish as it is fowls, or any other description of food.

For the American Agriculturist.

OSAGE ORANGE HEDGE.

I saw a very good letter in the *American Agriculturist*, a short time since, from a gentleman in Ohio, on the Osage hedge. I think his plan is a good one, but I wish to know something more from you, or some of your readers.

A year ago last spring I sowed the seed just where I wanted the fence. Last spring I cut it close, and now, after such a dry, hot summer as we have had, it looks well. I should like to know if any of your readers have a hedge growing from the seed instead of having been transplanted. It saves labor, and, I think, will make a fence as soon, if not sooner, than the old plan of first sowing the seed and then planting it out where the fence is wanted. Soaking the seed in the spring seems to be the manner of preparing the seed for the ground. I have heard of another plan, this fall, and am going to try it—i. e., sow the seed now, and let it lie in the ground all winter. I shall try half a pound, whether it answers or not, as I think it worth a trial.

I have before me Mr. Downing's plan of raising giant asparagus. He says, every one who sees his beds begs seed of him. He does not say when to plant it. I should like to know, and, also, how to manage it afterwards.

HENRY NORTH.

The objection to sowing seed for hedges where they are to grow is, that the plants do not come up or grow evenly. By transplanting from a bed, you can get plants of the same size, and set them exactly where wanted. The hedge grows up stronger and more uniformly.

It is better to sow the seed in the fall than spring, as the winter frost prepares it for vegetating early. If sown in the spring, it must be soaked till partially sprouted before planting. This takes from three to five days.

Asparagus may be transplanted (early in the spring is the best time) to a deep, rich, light, loamy soil. The after management is simply to keep the ground well cleaned and stirred. Fork in a good dressing of well rotted manure every spring and fall, and sow salt on it at the rate of fifty pounds or so for every square of twenty feet. When it is cultivated by the acre, or in larger quantities, after it gets well set every spring—early in March—you may cut off the tops with a scythe, give it a thick dressing of manure, and, as soon as the frost is out of the ground and it is dry enough, plow up the whole field as deep as possible, taking good care to cover the manure well. Then harrow, and the asparagus will soon shoot up as thick as it ought to grow. This is a very easy way of cultivating it on a large scale.

SUGAR IN LIBERIA.—Late accounts from this African Republic say that the culture and manufacture of sugar on the St. Paul's River was rapidly increasing. Fine large cane fields were to be seen in every direction, and during the current season it was thought that fifty sugar farms would be laid out. Some of the new sugar already landed at Monrovia is said to be of a fine quality.

NEVER be idle. If your hands can not be usefully employed, then attend to the cultivation of your mind.

Boys' Corner.

A DELAWARE BOY'S LETTER—CROPS—PRESERVING FRUITS, ETC.

McDONOUGH, Del., Oct. 6, 1854.

MESSRS. EDITORS: Some length of time having elapsed since my last letter, and there having been no boys' letters in your papers for several weeks, I again take the liberty to write. But I fear you will think me presumptuous in writing so many letters for your invaluable paper. I know there are many boys better able to write interesting letters than myself, but they do not seem to take hold.

It is now a slack time with the farmers. The wheat is nearly all sown and it is not quite time to husk corn, though some have commenced, particularly in the lower part of the State, though the farmers are not all done sowing wheat. The drouth in the lower counties was more severe than in this, which accounts for the early husking. And this is not all; a great many farmers are husking, in order to put the ground in wheat. I think there will be one-third more wheat sown, in this part of the country, this year, than any previous one, although present prices are rather discouraging.

The statement in my last letter, with regard to the last crop, has been fully confirmed. It was predicted by many, previous to harvesting, who judged from the straw, that there would be one-fourth over an average crop; but, it is now nearly all threshed, and they say there is not more than two-thirds. The largest and heaviest-looking wheat turned out the worst. On the other hand, the worst looking was comparatively good. The corn crop is also short here, and from the information which I have received from other parts of the State, it can not be more than three-fourths.

Of potatoes, turnips, cabbages, &c., there is a complete failure. Potatoes are now being gathered which is unusually early, but the vines are dead, which is caused by the drouth, together with the heavy frosts, which we have had for a fortnight past.

We have no apples this year and have not had a full crop for several years past. The farmers appear to take little interest in this delicious fruit. The orchards are declining, and, I am sorry to say, no new ones are being planted. Delaware is a great peach-growing State, but this season this crop also failed. The Messrs. Reybolds, who have hundreds of acres planted, had not enough to supply their own families.

We have a new method of preserving peaches here. The difficulty is to get the air out of them. If this is done they will keep for years. We put them in bottles which hold about a quart; the air is taken out of the bottles, and they are then corked very tightly. This is a very profitable business, and, if well conducted, fortunes might be made. They will bring from 75 cents to \$1 per bottle in England, and in our large cities they sell readily for 50 cents per bottle. Grapes, tomatoes, pears, cherries, and many other things that we can not get in Winter, may be kept in the same manner.

As it is now about the time for farmers' boys to go to school, probably you can give me some information concerning them. Are there no good schools near your city? Please give me your opinion of the "Conference Seminary." It is true we should encourage home, but it is equally true that there are no good schools in Delaware.

I visited the Pennsylvania State Fair, Messrs. Editors, and it was really a sight to see 70,000 persons collected together, and of all classes, from the minister to the sot—from the millionaire to the beggar; and there

was such a confusion, and it was so hot, there was no comfort. The fact is, there were too many people there for comfort; but it was far better so, than to have had but a few in attendance. It seems that the agricultural interests of Pennsylvania are rapidly increasing; and that State will, in all probability, soon be able to compete with her sister State, New-York.

THE DELAWARE FARMER'S SON.

THE PROMPT CLERK.

I once knew a young man, said an eminent preacher the other day, in a sermon to young men, that was commencing life as a clerk. One day his employer said to him, "Now, to-morrow that cargo of cotton must be got out and weighed, and we must have a regular account of it."

He was a young man of energy. This was the first time he had been entrusted to superintend the execution of this work; he made his arrangements over night, spoke to the men about the carts and horses, and resolving to begin very early in the morning, he instructed the laborers to be there at half past four o'clock. So they set to work and the thing was done. About ten or eleven o'clock his master comes in, seeing him sitting in the counting-house, looks very blank, supposing that his commands had not been executed.

"I thought," said the master, "you were requested to get out that cargo this morning?"

"It is done," said the young man, "and here is the account of it."

He never looked behind him from that moment—never! His character was fixed; confidence was established. He was found to be the man to do the thing with promptness. He very soon became one that could not be spared; he was as necessary to the firm as any of the partners.

[London Youth's Instructor.]

EARLY CHARACTER.

"THERE is nothing I despise so much as to see a boy with a cigar in his mouth." Thus remarked one of the wealthy and most respectable men of East Boston, standing at the door of the Post-office, waiting for the distribution of letters, as a boy walked in, puffing a cigar. Sympathising somewhat with the gentleman, we fell into the following reflections:

We imagined that, in the course of human events, this boy might be induced to apply at the gentleman's counting room for employment. The merchant's remembrance of this act of youthful dissipation would probably not be to the benefit of the applicant. The merchant would be likely to judge unfavorably of the young man's character as to temperance and sobriety, and would think himself justified in doubting the independence and stamina of one who, evidently for no better reason than because others do, and probably because he thought it would give him a manly air, contracted the offensive and unnatural habit of smoking in his boyhood. The very act would seem to argue mental and moral deficiency, or perhaps both. Little things are sometimes attended with great results. The merchant, like a majority of well bred people, is exceedingly annoyed with the smell of cigar smoke. He despises the practice of smoking, and can not help noticing the boy who exhibits it, or thinking in such case, what the mental manifestation is. With the boy, the act was a trifle, nothing. To the man it was a revelation which told him something of a youth of whom he knew nothing before, and that something was to his discredit.

How different would have been the result,

if the first act of this boy noticed by the merchant had been one that as plainly spoke of integrity and good sense, as the act of smoking did of weakness and frivolity of character. The man would have remarked that boy; and if it should ever have come in his way to render him a service, no testimonials would be needed to secure his favor.

We would fain impress upon the young the great importance of forming good habits. One may forsake his boyhood's errors when he becomes a man; but the chance is that, instead of being forsaken they will be aggravated, and take on a rigidity which is like second nature to the individual, as he advances into manhood. Knowing this, people judge of young men by what they knew of them when boys—unless a subsequent acquaintance gives them a better ground for the formation of an opinion.

[East Boston Ledger.]

CHINESE PROVERBS.

THE ripest fruit grows on the roughest wall.

It is the small wheels of the carriage that come in first.

The man who holds the ladder at the bottom is frequently of more service than he who is stationed at the top of it.

The turtle, though brought in at the area gate, takes the head of the table.

Better be the cat in a philanthropist's family, than a mutton pie at a king's banquet.

The learned pig didn't learn it letters in a day.

True merit, like the pearl inside an oyster, is content to remain quiet until it finds an opening.

The top strawberries are eaten the first.

He who leaves early gets the best hat.

Pride sleeps in a gilded crown; contentment in a cotton nightcap.

SINGULAR ENCOUNTER.—A few days ago, a common hen and a drake were observed in mortal strife by the side of the Oich, at Fort Augustus. For upwards of an hour the combat was maintained with equal vigor and animosity. Fortune at last seemed about to decide in favor of her of the barn-door; when suddenly the aquatic, collecting all the energy of despair, seized his opponent by the head, dragged her into the pool, dived with her into the water, and there drowned her. It appears that poor "chuckie's" male protector had on the previous day given a sound thrashing to the drake, and hence his revenge.

A schoolmaster, not a hundred miles from Presteign, was one day questioning a class, and, among others, asked how many senses there were? "Seven, sir," said a little fellow with great confidence, drawing himself up to his topmost height. "Prove it," said the master. "Well, taste is one; feeling, two; smelling, three; two ears, five, and two eyes make seven!"

A gentleman by the name of Slaughter, living in Alabama, being subpoenaed as a witness in a case pending in the Circuit Court, and being about to marry a Miss Lamb, wrote to the Court that he could not attend as a witness, as he expected "to Slaughter a Lamb next Sunday."

A wag is said to have drawn the letter M before the word "ice," on one of the "Cats-kill ice" carts, in this city, which made the sign read thus: "Cats kill Mice."

Your character can not be essentially injured except by your own acts.

Scrap-Book.

"A little humor now and then,
Is relished by the best of men."

BEYOND THE RIVER.

THE following beautiful lines, from the Dublin University Magazine, will remind the reader of the last scene in Bunyan's "Pilgrim's Progress."

Time is a river deep and wide;
And while along its banks we stray,
We see our loved ones o'er its tide
Sail from our sight away, away.
Where are they sped—they who return
No more to glad our longing eyes?
They've passed from life's contracted bourne
To land unseen, unknown, that lies
Beyond the river.

'Tis hid from view; but we may guess
How beautiful that realm must be;
For gleamings of its loveliness,
In visions granted, oft we see.
The very clouds that o'er it throw
Their veil, unraised for mortal sight,
With gold and purple tintings glow,
Reflected from the glorious light
Beyond the river.

And gentle airs, so sweet, so calm,
Steal sometimes from that viewless sphere;
The mourner feels their breath of balm,
And soothed sorrow dries the tear.
And sometimes list'ning ear may gain
Entrancing sound that hither floats;
The echo of a distant strain,
Of harps' and voices' blended notes,
Beyond the river.

There are our loved ones in their rest;
They've crossed Time's river—now no more
They heed the bubbles on its breast,
Nor feel the storms that sweep its shore.
But there pure love can live, can last—
They look for us their home to share;
When we in turn away have passed,
What joyful greetings wait us there,
Beyond the river!

SHE WISHED HE'D BEEN THERE.

A few sabbaths since, an orthodox clergyman, in this vicinity, exchanged with a Baptist brother from a neighboring city, who preached on the character of David, giving his own ideas of that good man, which did not agree exactly with the opinion of the church to whom he was talking. After the congregation had emerged from the house, we made it perfectly convenient to walk along with the deacon—a fine man, and "of the strictest sect," an orthodox Congregationalist.

"Well, deacon —," we commenced, what did you think of our preacher's sermon on David?"

He looked at us a moment, while a roguish expression was playing on his features, and answered:

"I'll tell you what I think of it, but I shall have to 'illustrate' by a story which would not come under the head of 'Sunday Reading,' perhaps, in a newspaper."

"Well, deacon —"

"Well, when I was a small boy, I lived with an old farmer, who was a strong Universalist, and, as there was no church of that denomination in the neighborhood, he used to have Sunday services at his house, and sometimes would have a preacher from abroad. In the other part of the house lived an old lady, who was as stiff a Baptist as my master was a Universalist. One Sunday we had a preacher who had Noah for a subject, and preached long and eloquently. The day was rainy, and the old lady in the other part could not get out to her church; and as there was but a thin partition between

her room and ours, she heard most of our minister's sermon. The next morning as I was standing outside of the door, with my master, the old lady came out, and he said:

"Good morning, ma'am. We had a preacher yesterday."

"Eh? Preached about Noah, eh? I heered him. I only wish Noah'd been there—he'd 'a' kicked him out quicker!"

We had the deacon's opinion of the sermon about David! [Lynn News.]

A DOMESTIC SCENE.—"Ba-a-a! Ba-a-a!" shrieks a half-naked infant, of about eighteen months old. "What's the matter with mamma's thweet yittle ducky?" says its affectionate mother, while she presses it to her bosom, and the young serpent, in return, digs its talons into her face. "Daden, Missis, I know what little massa Dim want?" exclaimed the cherub's negro nurse. "You black huzzy, why don't you tell me, then?" and the infuriated mother gives Dinah a douse with her shoe. "Why, he wants to put his foot in dat pan ob gravy wots on de harf!" whispers the unfortunate blackey. "Well, and why don't you bring it here, you aggravating nigger, you?" replies the mother of the bawling one. Dinah brings the gravy, and little Jim puts his bare feet into the pan, dashing the milk-warm grease about his sweet little shanks, to the infinite delight of his mother, who tenderly exclaims: "Did mamma's yittle Dimmy want to put his teeny weeny footies in the gravy? It shall paddle in the pan as it scoosey-wooseys, and then shall have its pooty red frock on, and go and see is pappy-yappy!"

HOPE AND MEMORY.

BY MRS. SIGOURNEY.

A baby lay in its cradle. A being with bright hair and a clear eye, came and kissed it. Her name was Hope. Its nurse denied it a toy, for which it cried, but Hope told it of one in store for it to-morrow. Its little sister gave it a flower, at which it clapped its hands joyfully, and Hope promised it fair ones that it should gather for itself.

The babe grew to be a boy. He was musing in the summer twilight. Another being, with a sweet and serious face, came and sat by him. Her name was Memory, and she said, "Look behind thee, and tell me what thou seest."

The boy answered, "I see a short path bordered with flowers. Butterflies spread out gay wings there, and birds sing among the shrubs. It seems to be the path where my feet have walked, for at the beginning of it was my own cradle."

"What art thou holding in thy hand?" asked Memory. And he answered, "A book which mother gave me." "Come hither," said Memory, with a gentle voice, and I will teach thee how to get honey out of it that shall be sweet when thy hair is gray."

The boy became a youth. Once as he lay in the bed, Hope and Memory came to the pillow. Hope sang a merry song, like the lark when she rises from her nest to the skies. Afterward she said, "follow me, and thou shalt have music in thy heart, as sweet as the lay I sang thee."

But Memory said, "He shall be mine also." Hope said, "Why need we contend? For as he keepeth virtue in his heart, we will be to him as sisters, all his life long." So he embraced Hope and Memory, and was beloved of them both.

When he awoke they blessed him, and he gave a hand to each. He became a man and girded him every morning for his labor, and every night he supped at the table of Memory, with Knowledge for his guest.

At length, age found the man, and turned

his temples white. So dim his eye, it seemed that the world was an altered place. But it was he himself that had changed, and the warm blood had grown cold in his veins.

Memory looked on him with grave and tender eyes, like a loving and long-tried friend. She sat down by his elbow-chair, and he said to her, "Thou hast not kept faithfully some of the jewels that I entrusted to thee; I fear they are lost."

She answered mournfully and meekly: "It may be so. The lock of my casket is worn. Sometimes I am weary, and fall asleep. Then time purloins my key. But the gems that thou gavest me when life was new, see! I have lost none of them. They are as brilliant as when they came into my hands."

Memory looked pitiful on him as she ceased to speak, wishing to be forgiven. But Hope began to unfold a radiant wing which she had long worn concealed beneath her robe, and daily tried its strength in a heavenward flight.

The old man lay down to die. And as the soul went forth from the body, the angels took it. Memory ascended by its side, and went through the open gate of heaven. There she expired, like a rose faintly giving forth its last odors.

A glorious form bent over her. Her name was Immortal Happiness. Hope commended to her the soul which she had followed through the world. "Religion," she said, "planted in it such seeds as bear the fruit of heaven. It is thine forever."

Her dying words were like the music of some breaking harp, mournful and sweet. And I heard the voice of angels saying, "Hope which is born of the earth must die, but Memory is as eternal as the books from which men are judged."

THE BRIDAL.

BY A CONFIRMED BACHELOR.

Not a laugh was heard, nor a joyous note,
As our friend to the bridal was hurried;
Not a wit discharged his farewell shot,
As the bachelor went to be married.

We married him quickly to save his fright,
Our heads from the sad sight turning;
And we sigh'd as we stood by the lamp's dim light,
To think him not more discerning.

To think that a bachelor free and bright,
And shy of the sex as we found him,
Should there at the altar, at dead of night,
Be caught in the snare that bound him.

Few and short were the words we said,
Though of wine and cake partaking;
We escorted him home from the scene of dread,
While his knees were awfully shaking.

Slowly and sadly we marched adown,
From the first to the lowermost story.
We never have heard from or seen the poor man
Whom we left not alone in his glory.

Down east there resides a certain M. D.
One very cold night he was aroused from his slumbers by a very loud knocking at his door. After some hesitation he went to the window and asked:

"Who's there?"

"A friend."

"What do you want?"

"Want to stay here all night."

"Stay there, then," was the benevolent reply.

A horse fell into a reservoir, in New-Bedford, a short time since, but was rescued by the spectators without serious injury. Upon being asked by a benevolent gentleman "if he was much hurt?" he said "neigh," and trotted off.

HOW TO IMPROVE A FARM.

It would, we think, be safe to say that eight out of ten of the farmers of America would be benefitted, if one half of their farms could be, to-day, taken from them, and they be compelled to expend all their labor, manure and money on the moiety remaining.

Our lands are seldom thoroughly plowed, whether we regard depth of tilth, or pulverization. They are (one may say *always*) insufficiently or improperly manured. The quantity of manure to be applied to the acre is decided by the amount of land under the plow; in the stead of tilling no more than could be sufficiently manured and otherwise properly cared for. Then, work pressing, the manure lies, spread and speeding away, for days, oftentimes, before it is plowed under. Then the crops are sold, not when the market price is at its height; but just as soon as the farmer can get the money for them.

These things should not be. A farmer requires capital, as does the manufacturer or the merchant, that he may judiciously invest it in his business; in labor or manure; or in live stock, and farm implements; in repairing what is broken, and rectifying what is wrong; in seeding at the right time; and generally, in doing all things at the proper moment, and in the proper manner. Two acres well cultivated, and well cared for, will produce more net profit, than ten that have been poorly tilled and poorly tended.

We all agree upon the resultant benefit of deep plowing, yet few farmers plow deep. Six inches is a poorly generous average for the depth of a New-England furrow. We all agree that it is wise to house, or otherwise protect from wind and rain, our deposits of manure; but do we do it? We differ little in our appreciation of the value of drainage; but how few are the ditches. In this way we could go through with a table of contents of "the whole duty of man on a farm;" and show, that while many are wise in word, few are wise in deed. We are of the breed of the undutiful son, who said, "I go," but budgeted not an inch.

Any one of these reasons is sufficient to account for the comparatively poor return, which farmers obtain for their labor, care, and diligence in the tillage of the soil.

The agriculture of Rhode Island may be fairly taken as the average standard of New-England; whether we speak of the knowledge and skill brought to bear upon it, or of the per-acre products of the land under tillage. For, while it is confessedly inferior to the best, it is far from being the worst.

In 1850, the Agricultural Society of Rhode Island induced the United States Assistant Marshals, for a consideration, to collect for them the agricultural statistics, that had been omitted in the Census Tables. By these returns it appeared, that the *average* product, per acre, of various crops was as follows: Of Indian corn, thirty and a half bushels; of rye, twelve and three-quarter bushels; of onions, four hundred bushels; of carrots four hundred bushels.

Any farmer is capable of calculating for himself the cost of growing an acre of each of these crops, and he may pronounce, for me, whether Agriculture in Rhode-Island paid its way. If, then, the average of the crops, as above, paid little, if anything, more than the expense of production; and the yield of that State is a fair average sample (and why is it not?) of the yield of New-England; we may safely set it down as settled, that if farming in our section does pay, it yet does not yield such an immense per centum per annum, as to cause a rush from the other professions.

The agricultural statistics of this State (which, as we have remarked, is the only one whose agricultural statistics are com-

plete and reliable,) show that the largest yield of carrots in the State, in the year 1850 (a bad year, for root crops, by the way, because of the drouth) was one thousand bushels to the acre; while the average yield was four hundred bushels, and the least, amount to seventy-five bushels; all told. Of onions, the largest crop was six hundred bushels; the average, four hundred; and the smallest, one hundred bushels, to the acre. Of Indian corn, the largest yield per acre, was one hundred bushels; the average, thirty and a half bushels; and the least, six. Of rye, the largest crop grown on an acre, was forty bushels; the average was twelve and three-quarters; and the smallest was—what think ye?—just three bushels!

Now, though we can easily see that it will well pay to gather these maximum crops, if economically produced, we can scarcely believe, that they more than make the two ends of the year meet, who raise but the average; while how the wolf is kept from the door of those, who persist in getting such crops as six bushels, of corn, or three bushels of rye, passes our comprehension. Three bushels of rye! Six bushels of corn! Why, they will scarcely suffice to feed the mice, that "most do congregate" in the granaries of such thriftless farmers.

We are, of course, aware that all soils are not to grow one hundred bushels of corn to the acre, and other crops in proportion. But they are very poor specimens of land, that will not, with good tillage, yield more than the averages above stated. Indeed, so far is it, in most instances, from being the fault of the land, that I feel safe in asserting, that, *on an exchange of farms*, the three-bushel farmer would, in a majority of cases, bring the land whereon was raised the forty bushels of rye, *down to the average*, in about the same time that a forty-bushel farmer would require to raise his bad bargain *up to the average*. [Practical Farmer.]

FARMERS GOING WEST.

During the past year there has been a large increase of emigration from the Eastern, Middle and Northern States to the West. The agricultural prosperity of Michigan, Illinois, Wisconsin, Indiana and Iowa—and the opening of Minnesota, Kansas and Nebraska, by which the rich soil and fine climate of those Territories are becoming patent to the people of the whole country—have very naturally attracted the attention of the people of the East, and induced either direct emigration, or, with that view, personal investigation. The high prices of farming lands in Western New-York, and other superior agricultural districts, and desirable localities, in this and other States, and the comparative cheapness of improved or partially improved farms situated on or near railroads or navigable streams in the Western States heretofore named, have given an impetus to agricultural emigration—while the favorable reports concerning the new territories have exercised a powerful influence in the same direction. Within a few months hundreds of persons who own farms of from 50 to 100 acres, have disposed of them at the advanced rates, (\$50 to \$150 per acre,) and purchased, at a comparatively trifling cost, large farms or tracts of unimproved land in the West. A portion of this emigration has been caused by the grasping disposition of many of our wealthy farmers, whose desire to own "all the land that joins them," has induced the purchase of adjoining farms at unusually high figures—a course not generally productive of benefit to community, or calculated to enhance Rural Improvement. In old sections, where land is dear, fields small and devoted to mixed husbandry, large farms are neither desirable nor the most profitable, and

hence we regret the diminution of the number of soil owners and cultivators.

In some localities the western fever is superinduced by poor farming, and the consequent deterioration and barrenness of the soil—naturally rich and fertile lands being worn out by the "skinning system" and general mismanagement. Those who do not believe in, or at least will not adopt, deep plowing, manuring, rotation, and other improvements—men who "know the right and still the wrong pursue"—find that their mode of farming *don't pay*; and, being too stupid to improve, or having too great a veneration for ancestors to depart from their stereotyped practices, are either obliged to sell and seek a virgin soil, or suffer both poverty and reproach. Such people—we will not call them farmers—of course benefit a district by leaving, (even if they depart secretly, between two days,) and generally advance their own interests—a change mutually satisfactory to themselves and community! Their exodus makes room for far better farmers and citizens. True, those who thus depart are not of the right stamp and mettle to settle in a new country yet it is hoped their posterity at least will be benefitted by a change which may lead to improvement.

Among others, the reasons already mentioned are inducing a strong tide of emigration westward, and naturally causing considerable inquiry as to the best locations for farming. We are in frequent receipt of letters soliciting information relative to the topography, soil, climate, &c., of various sections of the West, which we are unable to answer definitely from personal knowledge and observation—and feel incompetent to speak advisedly, as we are often requested to do, concerning the particular advantages of this or that Western State or Territory, compared with another, or with Western New-York. There are so many items to be considered, not a few of which are estimated differently by different individuals, that even those best informed arrive at opposite conclusions. For instance, one looks mainly for a rich soil, another for a healthy locality, another for society and religious and educational privileges, while others have different objects in view.

Compared with Western New-York, we hold and firmly believe, there is no district of equal extent which combines so many advantages—soil, climate, society, churches, schools, morality, intelligence and enterprise of the people, markets, facilities for travel, &c., &c. Of course no one expects all these at the West, and hence those who propose moving should seek a locality embracing the advantages considered of first importance in their estimation. Were we asked to designate what Western States we consider best for farming purposes, with other advantages usually esteemed by the people of this region, we should name Michigan, Wisconsin and Iowa. The latter is progressing more rapidly, probably, than any other, and presents many inducements to young men of enterprise and limited means. Many sections of Michigan, Wisconsin and Illinois, and some parts of Indiana, are desirable for those who wish to obtain improved or partially improved farms, at comparatively low prices, in good neighborhoods, and with educational and religious privileges.

In regard to the new Territories, we should prefer Kansas, though Minnesota, has its advantages. Our impression is that Iowa and Kansas are at this moment the most desirable points for young men, and women too, of limited means, if properly imbued with enterprise and determination.

[Rural New-Yorker.]

Small and steady gains give competency with tranquility of mind.

BABY SHOWS.—The people of Ohio have become quite excited upon the subject of baby shows. The matter has been carried to such an extent as to call forth the following remarks from the Cleveland Herald:

The thing is getting to be disgusting, when the contents of the cradle and the hog pen are judged by the same standard, when the babies are estimated by the pound like fat calves in the shambles.

A man named Mead, who had two twins—or rather whose wife had—and who was an unsuccessful competitor at the late Baby Show at Springfield, offers to bet \$200 on his babies against the field; and the babies to be shown with the other animals at the National Cattle Show, at Springfield, on the 27th.

We protest against baby shows becoming "permanent institutions." Or, if they must be repeated, we insist upon it that the fathers and mothers shall form a part of the show. If the design is—as in case of the exhibition of our animals—an improvement of the breed, why, by all means bring out the parents and let them be put through their paces around a ring. As the improvement of stock depends materially upon diet—its quality and quantity—the mothers should be questioned as to how and what they feed their babies upon, and whether nature receives any aid from the bottle; and remotely considered, the diet of the parents should be inquired into that the world may know all the whys and wherefores of the successful raising of human stock.

THE SALE of cattle, sheep, hogs, &c., recently imported by the Kentucky importing company, took place on the farm of Charles W. Innes, Esq., President of the company, in Fayette County, in that State, on Tuesday last. There was a large attendance at the sale, the bidding was spirited, and prices remunerative. The highest priced animal was a bull, Syrius, which received the premium at the recent Bourbon County agricultural fair, and was bought by Mr. R. A. Alexander, of Woodford, at \$3,500. [Cincinnati Com.]

To become respectable—say "yes" to every other man's opinions, and have none of your own.

A MAN of philosophic temperament resembles a cucumber; for although he may be completely cut up, he is still cool.

THE railroad employee who attempted to break up a train of circumstances, ran it into the ground.

THE man that "Oh'd for a lodge in some vast wilderness," has paid up.

If any one speaks evil of you, let your life be so virtuous that none will believe him.

EARN your money before you spend it.

Markets.

REMARKS.—Flour has risen about 25 cents per barrel the past week. Wheat is proportionably higher, with few arrivals. Corn and most other articles, no change worth noting.

The weather continues warm, with a copious rain on the night of the 28th October.

PRODUCE MARKET.

SATURDAY, October 28, 1854.

The prices given in our reports from week to week, are the average wholesale prices obtained by producers, and not those

at which produce is sold from the market. The variations in prices refer chiefly to the quality of the articles.

THE Market has been quite dull of late, by reason of the warm weather. It is, however, more brisk this morning, varying little from last week.

Potatoes of all kinds sustain no change. Cabbage is \$1 @ \$2 per 100 higher than last week. Other vegetables remain about the same.

The market is pretty well supplied with apples. Winter apples, as Baldwins, Spitzenbergs, Fall Pippins, Gilliflowers, &c., begin to come in plentifully. Cranberries are quite abundant, with no change.

Butter, eggs and cheese we quote the same, though the latter is dull of sale.

VEGETABLES.—Potatoes, Mercers, \$3 @ \$3 50 $\frac{1}{2}$ bbl.; White, \$2 50 @ \$2 75; Sweet, Philadelphia, \$2 75 @ \$3 25; Virginia, \$2 50 @ \$3; Turnips, White, \$1 @ \$1 25; Russia, \$1 75 @ \$2 25; Beets, \$2 75 @ \$3 $\frac{1}{2}$ hundred bunches; Carrots, same; Parsnips, \$3 50 @ \$4; Cabbages, \$5 @ \$7 $\frac{1}{2}$ hundred; Pumpkins, \$5 @ \$8 $\frac{1}{2}$ hundred; Celery, \$1 $\frac{1}{2}$ dozen.

FRUITS.—Apples, Baldwins and Spitzenbergs, \$1 75 $\frac{1}{2}$ bbl.; Fall Pippins, \$2; Newtown Pippins, \$3 25 @ \$3 50; Cranberries, \$6 @ \$7 $\frac{1}{2}$ bbl.

Butter, State 22c. @ 24c. $\frac{1}{2}$ lb.; Western, 18c. @ 19c.; Eggs, 20c. $\frac{1}{2}$ doz.; Cheese, 10c. @ 11c. $\frac{1}{2}$ lb.

NEW-YORK CATTLE MARKET.

MONDAY, Oct. 30, 1854.

The weather for the past few days has been quite warm and close, and to-day is very rainy. This may account, partially, for a further decline and dullness in the market. The brokers find it quite difficult to dispose of their stocks though they are not large, and mostly of superior quality. Indeed we do not remember to have seen a choicer lot of cattle in the Washington Yards, with the exception of a few droves brought there, it is hoped, for the purpose of showing the effect of contrast. We could wish, too, that it would teach cattle-dealers the folly of filling up the market with ungainly animals, which, at the best, are a mere burlesque on beef.

Best quality is selling at 9c. @ 9 $\frac{1}{2}$ c. $\frac{1}{2}$ lb.
Fair do. do. 7 $\frac{1}{2}$ c. @ 9c. do.
Inferior do. do. 6 $\frac{1}{2}$ c. @ 7 $\frac{1}{2}$ c. do.

We noticed to-day 90 cattle from Clarke County, Ky., owned by Wm. Gateskill, and sold by Geo. Toffey. Some of these were Durham grades, very large, and good quality; selling from 8 $\frac{1}{2}$ to 9 $\frac{1}{2}$ c. Weight about 700 lbs.

Seventy-four grass-fed steers, from Chester county, Pa., owned by H. Underwood, of the same place, and sold by C. G. Teed. Good beef, bringing about 9c., and estimated to weigh about 700 lbs.

One hundred and fourteen Chester Co. steers, owned by E. Wheaton, of New-York City. These were superior quality, and sold at 9c. @ 9 $\frac{1}{2}$ c. Estimated to weigh about 725 lbs.

Sixty-five Durham grades from Bourbon Co., Ky., owned by Moreland and Hicks, and sold by David Belden. These were very fine Western cattle—part of them having sold at Albany for 11c. They were selling to-day from 9c. @ 9 $\frac{1}{2}$ c. Estimated to weigh 750.

Eighty-eight sold by Geo. Ayrault. Of these 55 were from Livingston Co., N. Y., owned by Matthews & Lyon, and rather slim. They were selling at about 8c. The others were owned by Mr. Sheldon, of Cayuga County, Ky.; good quality, and selling at about 9c.

Two droves belonging to Joseph Williams, Chester Co., Pa. One of these was a superior lot of 97 beeves, sold by Culver, Hurd & Co., for 9 $\frac{1}{2}$ c. $\frac{1}{2}$ lb., and estimated to weigh 750 lbs. The other lot were good fair quality; sold by Mr. Merritt for about 9c. Estimated to weigh about 725 lbs.

Seventy-five Ohio cattle, owned by T. M. Vail, and sold by W. H. Gurney, from 8 $\frac{1}{2}$ to 9 $\frac{1}{2}$ c. Weight estimated at 650 lbs.

Eighty-three Chester Co. cattle, owned by Killough and Harlan, and sold by Mr. Merritt. These were good cattle selling for 9c. Weight about 700.

The following are about the highest and lowest prices:

Beeves 7c. @ 9 $\frac{1}{2}$ c.
Cows and Calves \$25 @ \$50.
Sheep \$2 @ \$5.
Lambs \$1 50 @ \$4.
Veals 4c. @ 6c.
Swine 4c. @ 4 $\frac{1}{2}$ c.

Mr. Chamberlain reports beeves, 7c. @ 9c.; cows and calves, \$20 @ \$50; veals, 5c @ 6 $\frac{1}{2}$ c.; sheep, \$2 @ \$6; lambs \$1 75 @ \$4 50.

Mr. Browning reports beeves, 7c. @ 9c.; cows and calves, \$20 @ \$45; veals, 4 $\frac{1}{2}$ c. @ 6c.; sheep and lambs, see sales below.

Mr. O'Brien reports beeves, 6c. @ 8c.; cows and calves \$25 @ \$40.

Washington Yards, Forty-fourth-street.

A. M. ALLERTON, Proprietor.

Cows and calves,	123	34	65
Sheep and lambs,	8462	4946	—
Veals,	108	42	24

All the brokers report the sheep market very dull the past week, with no prospect of a change till there is a change of weather.

Mr. James McCarty, 388 Bowery, sheep broker at Browning's, reports sales of 2050 sheep and lambs, for \$5,747 42, as follows:

SHEEP.—54 Sheep for \$94 05; 203 sheep and lambs, for \$528 75; 191 for \$534 25; 141 for \$481 50; 109 for \$266 75; 208 for \$710 74; 97 for \$155 25; 97 for \$163 25; 150 for \$422 25; 43 for \$175 75; 115 for \$378 75; 193 for \$482 25; 40 for \$125 50; 174 for \$392 25; 163 for \$441 13; 72 for \$298. Total number of sheep and lambs, 2,050—sold for \$5,747 42. Average per head, \$2 80.

Mr. Samuel McGraw, Sheep Broker at Browning's, reports sales of 941 sheep and lambs, sold during the past week for \$2,727 63, in the following lots and prices:

SHEEP AND LAMBS.—217 sheep for \$695 62; 134 sheep and lambs for \$283 75; 85 lambs for \$267 88; 198 lambs for \$332 87; 29 sheep for \$81 75; 36 lambs for \$77; 82 sheep for \$275; 51 sheep for \$134 01; 39 lambs for \$104; 13 sheep for \$39 50; 109 sheep and lambs for \$308; 38 sheep for \$128 25. Total number of sheep and lambs, 941—sold for \$2,727 63. Average \$2 89.

A PAIR OF FINE COACH HORSES FOR SALE.—Sixteen hands high, long tails; one six, the other seven years old; color gray. These horses are warranted kind, sound, strong, and enduring. They are offered for sale for no fault, but simply for not wanting their use the ensuing winter. They can be had for \$350, which is very cheap for them. Such horses are often sold at \$500 or \$600 in this city. Apply to
F. WOODFORD, 191 Water-st., N. Y.

IMPROVED SHORT HORN BULL FOR SALE.—The subscriber offers for sale his superior Short Horn Bull, PRINCE ALBERT, that won the second prize at the recent State Fair held in the City of New-York. Prince Albert was calved in 1849; his pedigree is of much merit; in color, he is a deep red with white marks; in temper, extremely mild and easily managed. He is an excellent stock-getter, and would not now be offered for sale, but that the subscriber, in the system of breeding he has adopted, has no further need of his services. Under these circumstances, he is for sale at the low price of three hundred dollars. The animal may be seen at Ellerslie farm, one mile south of Rhinebeck station. Address personally, or by letter,
WILLIAM KELLY,
Ellerslie, Rhinebeck.

ANDRE LEROY'S NURSERIES, AT ANGERS, FRANCE.—Mr. Leroy begs to inform his numerous friends that he is now prepared to execute all orders for TREES, EVERGREENS, SHRUBS, STOCKS, &c., entrusted to his care. His Trees, &c., are very fine this year, and his collection very complete. Orders should be sent at once, so as to secure the different kinds. The best care will be given to all orders, as usual. The Angers Quince Stocks have not succeeded well this year, and are scarce and high. Orders should be, as usual, addressed to our agent in New-York, Mr. EDWARD BOSSANGE, No. 138 Pearl-st., who will give all the information desired, and mail, on application, free of charge, a detailed copy of my catalogue, with prices, in dollars and cents.

TREES AND PLANTS.—PARSONS & CO., Flushing, near New-York, offer for sale their usual assortment, with the addition of many rare novelties of Fruit Trees, for the Orchard and the Garden; Ornamental Trees, Shrubs, and Roses, for the Avenue, Lawn, or Cemetery; Vines for the Grapery, and Exotic Plants for Greenhouse culture. Catalogues can be obtained at No. 68 Cedar-st., or will be sent by mail to all post-paying applicants enclosing a postage stamp.

1,000 ORNAMENTAL TREES FOR SALE.—\$100—Suitable for Belts, Masses, Shrubberies, Woods, &c., in the best and hardiest varieties, strong and well grown—delivered in Boston and New-York. Price list on application.
B. M. WATSON,
56-63 Old Colony Nurseries, Plymouth, Mass.

IMPROVED ESSEX PIGS.—The subscribers are now ready to engage pigs from Fall litters, got by their superior Boars, LORD WESTON and UNCLE TOM. Prices—\$25 per pair; \$15 a single pig. Also, the reserved lot of five, from a Spring litter, which won the first prize at the New-York State Show this year; consisting of three boars and two sows. Price—\$20 each. In all cases the money must be forwarded before shipment of the pigs; which will be well boxed, and sent by express or otherwise, as desired.
W. P. & C. S. WAINWRIGHT,
Rhinebeck, Dutchess Co., N. Y.

MULES FOR SALE.—The subscriber keeps constantly on hand 400 to 500 MULES, of all sizes. Among these are some of the choicest animals in the United States; 16 hands and over in height, and well proportioned. Mules are almost the only working animals used in portions of the Southern States, the West India Islands, and Spanish possessions, where severe work and hard usage are allotted them, and under which horses would soon die. An equal advantage would follow their introduction among farmers and others, in the northern States. They are not only much harder than horses, but they will draw more in proportion to their weight; will endure a great deal more; live twice as long, and eat less; and the only dressing or currying they need, is a soft place to roll on. They are gentle, tractable, and easily managed; and nobody who has ever tried them will ever give them up for horses or oxen. Call on, or address by letter, JAMES BUCKALEW, Jamesburg, New-Jersey. Refer to Amos Chamberlain, Bull's Head, 24th-st., N. Y. [59]

WACHUSETT GARDEN AND NURSERIES. New-Bedford, Mass. ANTHONY & McAFEE, Proprietors, successors to Henry H. Crapo, would invite the attention of the public to their extensive stock of Fruit and Ornamental Trees, Flowering Shrubs, Rose Bushes, &c., Evergreens, Balsam Firs, American and Chinese Arbor Vite, Cedrus Deodara, Cryptomeria Japonica, Norway Spruce, Yew Trees, Tree Box, &c., &c. An extensive assortment of Apple, Pear, Plum, Cherry, Peach, and Apricot Trees. The stock of Pear Trees is very large, both on Pear and Portugal Quince Stocks, embracing every thing worthy of cultivation. All our Pear Trees are propagated and grown by ourselves, and WARRANTED TRUE TO NAME. The soil, climate, &c., of this locality being so favorable to the Pear, our Trees are unrivaled for HEALTH, vigor of growth, &c., &c. They are all free from that destructive malady, THE PEAR BLIGHT, which has never existed in this locality. Prices low, and a liberal discount to the trade. New-Bedford, 1854.

SUPREME COURT.—In the matter of the Staking of lands for a new Reservoir, between Eighty-sixth and Ninety-sixth streets, and the Fifth and Seventh-avenues in the City of New-York.

To all owners, mortgagees, lessees, occupants, and other persons, in any matter, by judgment, decree or otherwise, entitled unto, or interested in the lands or premises above mentioned, or any part thereof.

Notice is hereby given that you are required to appear before the Commissioners of Appraisal in the above entitled proceeding, at the office, No. 293 Broadway, the third story front room, at 10 o'clock, A.M., on any day (Sundays excepted) on or prior to the 21st day of October next, and to produce the evidences to your title or interest therein. In default thereof, and in case the person entitled or interested as aforesaid shall not be ascertained by or be known to the said Commissioners, or be fully known, the same will be reported to the Supreme Court as belonging to unknown owners.

It being the desire to consummate this great improvement, and to present the report at the earliest day consistent with proper examination, and due regard to rights and interests affected, it is earnestly requested that all parties note and comply with the preceding notice, as no other or further notice will be issued.

Dated New-York, September 1, 1854.
EDWARD C. WEST,
ABRAHAM TURNURE, } Commissioners.
DANIEL DODGE.

ROBERT J. DILLON, Counsel to the Corporation.
N.B.—All papers published in the City of New-York are requested to publish the preceding notice until the 21st day of October next, once in each week, and to send their bills, with affidavits of publication, to the office of the Counsel to the Corporation, to be paid on the final taxation of the proceedings.

STATE OF NEW-YORK—Secretary's Office, Albany, August 10, 1854.—To the Sheriff of the County of New-York:—Sir: Notice is hereby given that at the GENERAL ELECTION to be held in this State on the TUESDAY succeeding the first Monday of November next, the following OFFICERS are TO BE ELECTED, to wit:

A Governor, in the place of Horatio Seymour;
A Lieutenant-Governor, in the place of Sanford E. Church;
A Canal Commissioner, in the place of Henry Fitzhugh; and
An Inspector of State Prisons, in the place of Henry Storms;
All of whose terms of office will expire on the last day of December next.

A Representative in the Thirty-fourth Congress of the United States, for the Third Congressional District, composed of the 1st, 11th, 12th, 13th, 14th, 15th, 16th, 17th, 18th, 19th, 20th, 21st, 22nd, Agricultural Implements.

AGRICULTURAL IMPLEMENTS.—The subscriber offers for sale the following valuable implements:

FAN MILLS—Of various kinds, for Rice as well as Wheat, Rye, &c.

GRAIN DRILLS—A machine which every large grain planter should possess. They are of the best patterns, embracing several varieties and sizes, and all the most valuable improvements.

SMUT MACHINES, Pilkington's, the most approved for general use.

HAY AND COTTON PRESSES—Bullock's Progressive Power-presses, and several other patterns, combining improvements which make them by far the best in use.

GRAIN MILLS, Corn and Cob Crushers, a very large assortment and of the best and latest improved kinds.

GRAIN MILLS, STEEL and CAST IRON Mills, at \$6 to \$25, and Burr-Stone at \$50 to \$250, for Horse or Steam Power.

TILE MACHINES—For making Draining Tiles of all descriptions and sizes.

WATER RAMS, SUCTION, FORCE and Endless-chain Pumps; Leather, Gutta Percha, India Rubber Hose, Lead Pipe, &c.

CALIFORNIA IMPLEMENTS OF ALL kinds, made expressly for the California and Oregon markets.

DRAINING TILES OF ALL FORMS and sizes.

THRESHERS AND FANNING-MILLS combined, of three sizes and prices, requiring from two to eight horses to drive them, with corresponding horse powers. These are the latest improved patterns in the United States.

SOUTHERN PLOWS—Nos. 10 $\frac{1}{2}$, 11 $\frac{1}{2}$, 12 $\frac{1}{2}$, 14, 15, 18, 18 $\frac{1}{2}$, 19, 19 $\frac{1}{2}$, 20, A 1, A 2, Nos. 50, 60, and all other sizes.

PLOWS—A large variety of patterns, among which are the most approved Sod, Stubble, Side-hill, Double-mold, Sub-soil, Lock Coulter, Self-Sharpeners, &c.

CARTS AND WAGGONS—With iron and wood axles, on hand or made to order, in the best and most serviceable manner.

HAY, STRAW AND STALK CUTTERS of all sizes and great variety of patterns.

CORN SHELLERS—For Hand or Horse Power.

FARMERS AND MERCHANTS WILL find at my Warehouse every Implement or Machine required on a PLANTATION, FARM, or GARDEN. I would call attention to a few of many others offered for sale:

VEGETABLE CUTTERS and VEGETABLE BOILERS, for cutting and boiling food for stock.

BUSH HOOKS and SCYTHES, ROOT-PULLERS, POST-HOLE AUGERS, OX YOKES, OX, LOG and TRACE CHAINS.

Grub Hoes, Picks, Shovels, Spades, Wheelbarrows, Harrows, Cultivators, Road-Scrapers, Grindstones, Seed and Grain Drills, Garden Engines, Sausage Cutters and Stuffers, Garden and Field Rollers, Mowing and Reaping Machines, Churns, Cheese Presses, Portable Blacksmith Forges, Bark Mills, Corn and Cob Crushers, Weather Vanes, Lightning Rods, Horticultural and Carpenters' Tool Chests.

Cover Hullers, Saw Machines, Cotton Gins, Shingle Machines, Scales, Gin Gear, Apple Parers, Rakes, Wire Cloth, Hay and Manure Forks, Belting for Machinery, &c. R. L. ALLEN, 189 and 191 Water-st.

GRASS SEEDS.—Timothy, Red Top, Kentucky Blue, Orchard, Fowl Meadow, Ray, Sweet-scented Vernal, Tall Fescue, Muskit or Texas, Tall Oat and Spurry.

Red and White Clover, Lucerne, Saintfoin, Alsike Clover, Sweet-scented Clover, Crimson or Scarlet Clover.

FIELD SEEDS.—A full assortment of the best Field Seeds, pure and perfectly fresh, including Winter and Spring Wheat of all the best varieties, Winter Rye.

Barley, Buckwheat, Oats, of several choice kinds, Corn, of great variety, Spring and Winter Fitches.

PEAS, BEETS, CARROTS, PARSNIPS, and all other useful Seeds for the farmer and planter.

GARDEN SEEDS.—A large and complete assortment of the different kinds in use at the North and South—all fresh and pure, and imported and home grown expressly for my establishment.

XXXV. Allen's American Farm Book. Price \$1.

XXXVI. The American Florists' Guide. Price 75 cents.

XXXVII. The Cottage and Farm Bee-Keeper. Price 50 cents.

XXXVIII. Hoar on the Culture of the Grape. Price 50 cents.

XXXIX. Country Dwellings; or the American Architect. Price \$6.

XL. Lindley's Guide to the Orchard. Price \$1 25.

XLI. Gunn's Domestic Medicine. A book for every married man and woman. Price \$3.

XLII. The Progressive Farmer. A book for every boy in the country. Price 50 cents.

XLIII. Allen's Diseases of Domestic Animals. Price 75 cents.

XLIV. Saxton's Rural Hand-books. 2 vols. Price \$2 50.

XLV. Beattie's Southern Agriculture. Price \$1.

XLVI. Smith's Landscape Gardening. Containing Hints on arranging Parks, Pleasure Grounds, &c. Edited by Lewis F. Allen. Price \$1 25.

RECENTLY PUBLISHED.

XLVII. The Farmer's Land Measurer; or Pocket Companion. Price 50 cents.

XLVIII. Buist's American Flower Garden Directory. Price \$1.

XLIX. The American Fruit Grower's Guide in Orchard and Garden. Being the most complete book on the subject ever published.

L. Quinby's Mysteries of Bee-Keeping Explained. Price \$1.

Directions for the Use of Guano.—A full and minute description of the different crops and soils to which Peruvian Guano is adapted, with full directions for its application, a pamphlet of 96 pages, and can be sent through the mail. Price 25 cents.

R. L. ALLEN, 189 and 191 Water-st.

CHINESE PIGS—From pure bred Stock direct from China—very fine of their kind.

B. & C. S. HAINES, Elizabethtown, New-Jersey.

54-55

FRUIT TREES FOR SALE.—I have now ready for sale one of the most complete selections of Fruit Trees ever offered in this part of the country, and as thrifty and handsome Trees as can be found in the United States. Apples, Pears, Peaches, Plums, Grapes, Quinces, Strawberries, &c.

Subscribers to this paper will find in it the coming year full directions for managing Fruit Trees in the best manner, with a complete list of the best varieties.

WM. DAY, Morristown, N. J.

PEACH TREES.—The subscriber offers for sale, from their Nurseries at Rumson's Neck, Shrewsbury, N. J., French Trees of the choicest varieties. Orders for the same by mail to be directed to them at Red Bank, Monmouth County, N. J. [39-69] ASHER HANCE & SON.

FANCY FOWLS.—Shanghai Fowls—direct importations—and Golden Pheasants, for sale by

WM. DAY, Morristown, N. J.

52-53

FOR SALE, AT THE SOUTH NORWALK NURSERY, a fine stock of the New-Rochelle (or Lawton) Blackberry Plants, at \$6 per dozen, also the White-fruited variety at \$3 per dozen; also the new or pure Red Antwerp Raspberry.

GEO. SEYMOUR & CO., South Norwalk, Conn.

51-76

SUPERIOR SEED WHEAT.—A LARGE assortment of the best varieties of improved Seed Wheat, among which are the Red Mediterranean, White Mediterranean, Soule's and Blue stem. For sale by

R. L. ALLEN, 189 and 191 Water-st.

FANCY FOWLS FOR SALE.—A variety of pure bred Fowls, Asiatic, Spanish and Game Fowls, Sebright, Black African, Antwerp, and other Bantams.

B. & C. S. HAINES, Elizabethtown, New-Jersey

54-55

THE HORSE, THE HORSE, NOBLEST OF DOMESTIC ANIMALS, And the one most frequently ill-treated, neglected, and abused. We have just published a Book so valuable to every man who owns a horse, that no one should willingly be without it. It is entitled,

THE MODERN HORSE DOCTOR, and is from the pen of that celebrated English Veterinary Surgeon, Dr. GEO. H. DADD, well known for many years in this country, as one of the most successful scientific and popular writers and lecturers in this branch of Medical and Surgical science. The Book which he now offers to the public is the result of many years' study and practical experience which few have had.

From the numerous and strong commendations, of distinguished men and the newspaper press, we select the following: Extract from a letter from Hon. John H. Clifford, Ex-Governor of Massachusetts:

NEW-BEDFORD, May 11, 1854.
DR. DADD—Dear Sir: I hope your new work on the noblest creature that man has ever been permitted to hold in subjection—the Horse—will meet with that success which all your efforts in this direction so well deserve.

Your obedient servant,
JOHN H. CLIFFORD.

From Hon. Marshall P. Wilder.
BOSTON, May 13, 1854.

DR. DADD—My Dear Sir: I am greatly obliged to you for the valuable treatise, the results of your own investigations, which you have recently issued, hoping that it may meet with the patronage of a discriminating community.

I remain yours with great regard,
MARSHALL P. WILDER.

The "Modern Horse Doctor," by Dr. G. H. Dadd, is a manual of genuine science, and ought to be owned and studied on the score of humanity, as well as interest by every man who owns a horse. [Boston Congregationalist.]

Dr. Dadd has had great experience in the cure of sick horses, and explains the secret of his success in this volume. [New York Tribune.]

The author of this work is well known as a most skillful veterinary surgeon. His book is based on the soundest common sense, and as a hand-book for practical use, we know of nothing to compare with it. [Yankee Blade.]

We know Dr. Dadd well, and are satisfied that he possesses most important qualifications for preparing such a book as this. [New-England Farmer.]

Messrs. Jewett & Co. have just published a very valuable work by Mr. Dadd, a well-known veterinary surgeon, on the causes, nature and treatment of disease, and lameness in horses. [Farmer's Cabinet.]

This is one of the most valuable treatises on the subject ever published; and no owner of that noblest of the animal race, the horse, should be without it. Especially should it be in the hands of every hotel and livery-stable keeper. To many a man would it be worth hundreds of dollars every year. [Ind. Democrat, Concord.]

By far the most learned and copious work on horse and his diseases we have ever seen. [N. Y. Evangelist.]

One of the greatest and most commendable qualities of this work is, it is practical and plain to the comprehension of those farmers and others for whom it is mainly designed. The course of treatment favors generally a more sanative and rational system of medication than that recommended in any previously existing works on farriery. No farmer or owner of a horse should be without this book. Stable-keepers, stage-proprietors and hackmen we believe would derive profit by having at least one copy hung up in their stables for use and reference by their stable men. [Daily News, Philadelphia.]

There is more common sense in this book than any of the kind we have ever seen, and farmers and owners of horses will find it a matter of economy to possess themselves of it. It will be of more service than the counsel of a score of ordinary doctors. [Albany Courier.]

We deem this decidedly the best and most reliable work on the "Cause, Nature, and treatment of Disease and Lameness in Horses," ever published. [Nantucket Inquirer.]

What we have read of this book induces us to regard it as a very sensible and valuable work; and we learn that those much more competent to judge of its value, have given it their unqualified approval. [Eve. Traveller, Boston.]

This book supplies a great desideratum which Skinner's admirable treatise on the horse did not fill. Every man may be his own veterinary surgeon, and with much greater safety to this noble animal, than by trusting him to the treatment of the empirical itinerants who infest the country. It is well illustrated, and should be purchased by every man who owns a horse. [Eve. Mirror, New-York.]

This is a book that should be forthwith put into the hands of all who own or drive horses, whether for the dray or gig, for the plow, omnibus or road, for hard service or pleasure. [McKinn's Courier, Phila.]

A good, clearly-written book, which should be in the hands of every man who has a horse whose ills his affection or his purse make it worth while to cure. [Bangor Mercury.]

It is a valuable book to those who have the care of horses. [Hartford Herald.]

This is a scientific, thorough and complete treatise upon the diseases to which one of the noblest of animals is subject, and the remedies which they severally require. [Troy Budget.]

He is not worthy to have a horse in his care who will not use such a work to qualify himself for his duties to this animal. [Commonwealth, Boston.]

Published by JOHN P. JEWETT & CO., Boston.

JEWETT, PROCTOR & WORTHINGTON, Cleveland, Ohio.

For sale by all Booksellers. 50-63

HORSE POWERS THRESHERS AND

SEPARATORS.—The Endless Chain or Railway Powers of our own Manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, durability, and economy. They are universally approved wherever they have been tried.

2. The Bogardus Power, for one to four horses. These are compact and wholly of iron, and adapted to all kinds of work.

3. Eddy's Circular Wrought-iron large Cog Wheels, for one to six horses.

4. Trimble's Iron-sweep Power, for one to four horses.

THRESHERS.—Improved Threshers upon the best principles, threshing clean with great rapidity, without breaking the grain.

One-Horse, Undershot \$25

Two-Horse, do \$30 to \$35

One-Horse, Overshot \$28

Two-Horse, do \$33 to \$38

Separator, which greatly facilitates cleaning the grain and preparing it for the fanning-mill, &c. \$7 to \$10

All the above-named machines are guaranteed the best in the United States.

R. L. ALLEN, 189 and 191 Water-st.

FRUIT AND ORNAMENTAL TREES

AND PLANTS.—Including every thing necessary to the Garden, Green-house, Nursery and Orchard, with all the recent introductions, at very low rates. Descriptive price Catalogues gratis. Carriage paid to New-York. Ornamental and other planting done in any part of the country. The best season for transplanting is after October 10. Address

B. M. WATSON, Old Colony Nurseries, Plymouth, Mass.

Special Notices to Subscribers, Correspondents, &c.

SUBSCRIPTIONS can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September, as a half yearly volume of 416 pages, with a complete index, begins on each of those dates.

Those wishing their papers changed from one office to another, should give the name, County, and State, of their old and new Post-office.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Clubs may add to their number at the same rate per copy as was paid by the original members.

The paper is stopped when the time for which it is paid expires. A notice or bill is usually sent in the last number.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then inclose them in presence of the Postmaster. Give the Post-office, and the County and State. Write these very plainly.

Economical Arrangement to Furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished

PUBLISHERS' ANNOUNCEMENT!

THIRTEENTH VOLUME OF

THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

The American Agriculturist,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

N. B.—The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume, for the bound work.

COMPREHENSIVE IN ITS CHARACTER.

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the Agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "Farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent Farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor, by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of Agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers *only* that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon its *own merits*; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammelled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great Agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the joint Editorial supervision of Mr. A. B. ALLEN—its principal editor for the first ten years—and Mr. ORANGE JUDG, A. M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical Agriculture, and, in addition to these, a number of other eminent Agricultural and Horticultural writers.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and Post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers.....	\$2 00	A YEAR,	\$2 00
" Clubs of 3 do.....	1 67	"	5 00
" " 5 do.....	1 60	"	8 00
" " 10 do.....	1 50	"	15 00
" " 20 do.....	1 25	"	25 00

The money always to accompany the names for which the paper is ordered.

The Postmaster, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Postmaster, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, Weekly Tribune, or Weekly Times, or any other paper or periodical in this City, the cost not exceeding two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if inclosed and mailed in the presence of the Postmaster.

Communications for the paper should be addressed to the Editors; Subscriptions, Advertisements, and all matters relating to the business department, should be addressed to the Publishers,

THE GREAT NATIONAL CATTLE SHOW AT SPRINGFIELD, OHIO.

THIS event came off, according to appointment, on the 25th, 26th and 27th days of October, as successfully as, under the combatting circumstances of the time, could be expected. We say combatting circumstances, as only meaning that, owing to the fact that all the State and County Shows of the adjoining and neighboring States having been already held, and that the Ohio State Society had postponed their own Exhibition three weeks later than the time first appointed, the public curiosity, for the season, had become measurably exhausted; and the Ohio State Show having been held the previous week, at Newark, many of the exhibitors, as well as their stock, were so jaded by fatigue as to enter into this new contest with little relish, and in greatly lessened numbers.

Presuming that an exhibition of this kind would awaken great interest with the Short Horn cattle-breeders of Ohio and Kentucky, the two States where they are kept in greatest numbers; and into which, within the two past years, probably three hundred animals of this breed have been imported from England, we determined to attend the show in person, and take our own view of whatever might come under inspection.

Springfield, where this show has been held, is a fine, growing town, in the beautiful valley of the Mad river, a principal branch of the Big Miami, in the heart of as fine a country as lies in Ohio. It has six or seven thousand inhabitants, enterprising and prosperous. It is finely built in and about its center, with many tasteful dwellings in the environs, seated on beautifully wooded eminences. A Lutheran college, in flourishing condition, stands just without the town; a female academy is located here; a high school, for boys, is at hand; and the people are distinguished for intelligence, good morals, and refinement. A more eligible point for an exhibition of the kind could scarcely be selected in the State, or more accessible by railway, and in the conveniences it afforded to visitors.

The show-grounds were just adjoining the town, and belong to the Clarke County Agricultural Society. They comprise some 20 acres; are commodiously and permanently fitted up with cattle-sheds, railings, committee-rooms, wide sheds for machinery and

manufactures, horse and cattle rings, and all such like necessary appendages; ample walks and drives, cut out of a beautiful natural grove, with the great body of the wood yet standing, but cleared out and thinned, affording a delightful shade all over it—a thing of taste and beauty.

The earth had been cooled and the dust laid on Monday previous to the show, with a timely and gentle rain; in the early part of the day, and in the afternoon, the stock began to arrive in considerable numbers by the various railways centering in the town. Owing to the prompt and excellent arrangements made by the local executive committee, abundance of forage of all kinds had been prepared, and already on the ground; the hay and straw department of which was free for all, while meal and grains were abundant, and at moderate prices for those who required them for their stock. Thus the cattle, as they arrived, were moved directly to the grounds without hindrance, and placed in permanent quarters while remaining at the show.

On Tuesday the weather opened fair, bland and delightful—perfect autumnal days, without a particle of frost at night, and so continued for the week. During all the day the stock continued to arrive, when, at night, there were probably two hundred and fifty cattle on the ground—every one housed, snug and comfortable in separate stalls, with adjoining bunks temporarily got up for their keepers and attendants. It was truly a beautiful, spirit stirring, grateful spectacle to walk around the cattle-quarters at sundown, and see so many noble animals all comfortably housed, lying at rest, and ruminating so peacefully and contentedly; while the men attending them were loitering, or sitting apart in groups, the toils of the day ended, and enjoying their meals, or their jokes, each in their own peculiar way. Here were Highland Scotchmen, who had, from the "heather" land, followed the fortunes of the cattle they tended across the water, into Kentucky, and now kept them company. There were Englishmen, from various noted cattle districts at home, each one in charge of sundry and valuable beasts, which they knew how so well and so methodically to tend. Now and then, but few and far between, an Irishman, from a neighboring county, who had led in triumph a stout bullock into the inclosure, and of which he had the special and particular charge. To these were added native Kentuckians and Ohioans, Pennamites and Hoosiers, all hale,

hearty young men, pleased with the excitement of the time, and each inwardly exalted with the prominent part which his favorite beast was expected to play in the coming show.

By this time, also, some thousands of visitors had arrived in Springfield to witness the exhibition, filling the public houses to a *cram*, and making no scanty demonstration upon the private hospitalities of the good people, who had extended their borders for the occasion.

On Wednesday morning some lagging squadrons of cattle, which the disordered arrangements of the railroads had thus far detained, came in. These, however, were soon housed, and put into condition. The preliminary labors usual to the opening of an exhibition, such as the appearance of the Chief Marshal and his assistants, the calling together the various committees present, the filling of vacancies, and various other *et ceteras*, were got along with, so that, by 12 o'clock, the business of the day was commenced. The time was thenceforward consumed in examinations of the various departments of stock, and most of the classes were brought into the great cattle-ring for inspection. Several thousand people were on the ground throughout the day, which, on the whole, like the preceding, was considered one mainly of preparation.

On Thursday, at sunrise, the gates of the show-grounds opened, and by 8 o'clock began to fill rapidly with the gathering multitude. The viewing committees were promptly at their work, and so continued up to 2 o'clock, the hour appointed for the dinner, or rather, in more courtly phrase, the "banquet," as duly heralded in the bills of the day. This affair we shall dispatch more briefly than we did even the edibles themselves; as it was more of an interruption of the pleasures and profits of the day, which every one—except the few who were only up for dinner and speech-making, if such there were—came to enjoy among the cattle rather than an entertainment, in which they could not find prolonged pleasure.

The dinner was well arranged, under broad awnings, and in great abundance and variety. President Wilder presided with dignity, and made a pertinent opening speech. Grace was said, in due form, by an attendant Divine, and the tables were filled with a highly respectable company. But we confess to a deep mortification of the flesh, in seeing twice as many men and women standing on the outside, leaning on the slight rail-

ing which separated the dining-company from them, watching every mouthful they devoured, and refusing to come in to aid, by the paltry price of a dinner-ticket, the liberality of the public-spirited citizens of the town, who had got up the magnificent show more for the general benefit of the people than of the town. We thought this gaping on by the multitude gross ill manners, at the time—we think so still. The speeches and toasts at the table were in good taste, but nothing variant from other like occasions; so we shall omit further notice of them than to say, that all such matters should not be a part of the *business* of a cattle-show, either State or National, during daylight, but adjourned to an evening sitting, when the time can not be devoted to more important objects. As it was, the dinner consumed all the time from 2 o'clock till sundown—a period in which some of the committees had important labors to accomplish, and which had to be postponed until the next day.

THE STOCK.

Of the varieties exhibited other than the Short Horns, the numbers were limited, yet most of them choice specimens.

Of *Devons*, there were perhaps twenty: a two-year old heifer, and two bull calves, the property of Gen. Meriwether, of Todd County, Ky., recently from the herd of Mr. Van Rensselaer, of Otsego, N. Y. A two-year old bull, and two young cows, of Mr. L. F. Allen, of Buffalo, and one of which, a first-prize animal, Gen. Meriwether added to his others before leaving; three or four from an adjoining county, and a few from Indiana, comprised the list.

Of *Ayrshires*, only six or eight were exhibited. They were good animals of their kind, and mostly purchased, a few years since, from the herd of Mr. E. P. Prentice, of Albany. They now belonged, with but one or two exceptions, to Mr. Melendy, near Cincinnati.

Of *Alderneys*, Mr. R. L. Colt, of New Jersey, had four or five on the ground, which he had sent all the way from his home in Paterson. They were choice of their kind, and attracted much attention. Not one person in fifty on the ground had ever seen an Alderney before, and very few had even "hearn tell about 'em." To stand near, and hear the grotesque remarks which the people made upon them, as they looked at their diminished proportions and peculiar figures, in profound ignorance of their valuable butter qualities, was not a little ludicrous; while, to hear the questions of others knowing little or nothing but what they had read of them, and wishing to really learn, and now for the first time witnessing these creatures in actual life before them, was quite amusing. But before the show was over, the little Alderneys won their way to much good opinion. The cow was milked while she stood in her stall; the milk was tasted by sundry ladies and gentlemen present; and Gen. Worthington, of Chillicothe, the intelligent chairman of the committee viewing them, made a report setting forth their proper worth and utility. We understand that a part of them were disposed of during the

show, so rapidly had they wrought into the good graces of gentlemen present; and now we trust that Ohio and the States around her will, ere long, rejoice in the possession of their rich-milking Alderneys, as they long have in their stately and massive Short Horns.

The *Herefords* present were good, particularly the two bulls and cows of Mr. Aston, of Lorain County, Ohio, and some of those of Mr. Sotham, of New York. The number, altogether, was about twenty. We trust that this valuable race of beef-making and work-oxen cattle will be better appreciated in our Western States than they have hitherto been.

THE SHORT HORNS.

If we were to give loose to our feelings while attempting to write of the grand and imposing array that was before us in this matchless class of cattle, our pen would involuntarily fall from our fingers, and we might, perchance, for once in our life, grow eloquent in speech. The number of these on the ground was upwards of a hundred; and they chiefly the pick of the best in Ohio, Kentucky, and Indiana, from the native bred as well as the recently imported animals of the kind. Some of the highest-priced bulls, however, were absent, not being now in show condition. Of this class, first in the field in point of time, were those of Brutus J. Clay, the two Messrs. Duncan, and the two brothers Bedford, of Bourbon County, Ky. They brought in a herd of fifteen cows and bulls. It might be invidious to speak of these fine specimens to the omission of others; but we can truly say, that as they were a selection from the best of Kentucky's prize cattle, they were, combined, a paragon of beauty and excellence. Some of them had taken half a score of first prizes, in their different ages and classes, at home. Their condition for high show was first-rate—not a thing lacking that could add attraction to their qualities. Next to these, out of Ohio, was the fine herd of Col. Solomon Meredith, of Wayne County, Indiana—half a dozen in number, most of them Kentucky bred, with an imported one or two for comparison. Then came the beautiful herds of Doctor Arthur Watts, of Chillicothe, the brothers W. D. and Jacob Pierce, and Mr. Waddle, of Clarke County, and many other breeders, smaller in number, but equally meritorious in the quality of their stock. Among them were the Hadleys, the Dunns, Clarks, Steddoms, Palmers, and others, of Ohio; together with Caldwell, Thrasher, and Davidson, of Indiana, and Ware, of Kentucky. Col. Sherwood, of Auburn, N. Y., also contributed a fine young bull—La Fayette—who drew a prize in his class. Mr. Pendergrast, of Chataque County, N. Y., also exhibited a fine imported bull, and a capital large milking Short Horn cow. We can not well particularize, where there was so large an array of excellence; but can freely say that, in any and in all the shows we have before witnessed—and they are of the largest and best ever made in the United States—we never saw so difficult a place to select the best, as among the Short Horns got together at Springfield.

As we were otherwise occupied during the time that the competing classes were on exhibition before the judges in the ring, we could not note them particularly there, and we might not accord, perhaps, with them in the merit of every individual prize awarded; but for the chief part of them, they are probably as correct as the circumstances would permit.

The first prize, in bulls, of \$300, was awarded to Mr. Edward G. Bedford's Kentucky bred bull, Bourbon County—Perfection, 6 years old.

The second, to an imported bull, of the Madison County importation of last year, 4 years old—Sheffelder—belonging to J. W. Robinson, of Madison County, Ohio.

The third premium was to Mr. Caldwell's Kentucky bred bull, Belmont, now of Fayette County, Indiana.

In cows, Brutus J. Clay won the first prize on his imported cow, Lady Stanhope—a noble creature.

The second, was on Duchess, an imported cow of Mr. Palmer's, Fayette Co., Ohio.

The third, on Clara Fisher, a Kentucky cow, belonging to Col. Meredith, of Wayne County, Ia.

Of the classes following, the prizes were distributed in about like proportions to native bred and imported Short Horns, for the particulars of which we must refer the reader to the published list of prizes in the several papers of the day.

But the great contest of the occasion—the hopes, and fears, and aspirations, of the several candidates for victory—was the sweepstakes, consisting of a single bull and five cows belonging to any one herd. In this class there were six entries, viz: Brutus J. Clay, of Kentucky; Solomon Meredith, of Indiana; Arthur Watts, A. Waddle, W. D. Pierce, and Jacob Pierce, of Ohio. As Mr. Waddle's stock was but recently imported, and hardly yet upon their legs from a long sea voyage, he withdrew them from competition, and we did not see them on the ground. Of the herds exhibited, those belonging to the two Messrs. Pierce were in low condition, from the dry season, and although containing several excellent animals, and of great promise, particularly among the young imported heifers, the committee, so far as I could learn, mainly selected for discussion the herds of Mr. Clay, Doctor Watts, and Mr. Meredith. It is no more than justice to say of these, that fifteen finer cows can scarcely, in the aggregate, be found together; and adding a selection from those of the Pierce's imported ones, a score, that even England may be challenged to excel—so ripe were their points, so perfect their condition, and so well selected for an imposing exhibition. Arranged as they were, in a line, each herd headed by their bull, it was the most splendid array of cattle we ever witnessed; and it is not strange that, after a very minute examination of several hours, and two further hours of consultation and trial, the committee of eight, to whom they were referred, should disagree upon the comparative merits, and come to no decision.

This was the fact, and the great trial of

superiority of any one herd over another, in a matched competition of Short Horns, has yet to be settled! The pride of three States was enlisted in this, and no one achieved a victory over the other. Each competitor had a right to feel proud of his herd, and gratified that if he had not the best, no one, in the opinion of the public, had a better than his own. Upon a report of the committee to the Society, that they could not agree, they were discharged from further duty.

In the class of *Fat Cattle*, there were perhaps twenty exhibited, some of which were remarkably fine, particularly some high bred Short Horns, from Kentucky, both heifers and bullocks. There were a pair of enormous oxen, of the old "Patton stock," now almost obsolete, but, many years ago, a celebrated variety of cattle in Kentucky. They were black, with white faces, had been worked some years, now seven years old, and weighed 5,200 pounds the pair. Another Patton, and Short Horn ox, was shown by Mr. Stedman, of Cleveland, enormously large in frame, weighing 2,900 lbs.

There was a remarkable milk cow, belonging to J. W. Brock, of Highland County, Ohio, about whose marvelous lacteal achievements we shall discourse hereafter. We examined this cow particularly, and if the statements of her owner be verified, the famed "Oaks cow, of Danvers, Massachusetts," must pale her hitherto refulgent reputation in perpetual gloom.

There may have been other cattle worthy of note, which, in the multitude of our observations, may have been overlooked, and in a general account like this, may be omitted; and, could we have appropriated three weeks instead of three days to the examination, we should have amassed none too much knowledge of the subjects before us.

On Friday afternoon, at 2 o'clock, the reports of the several committees on prizes, the grand procession of the prize cattle, and the concluding duties of awarding the prizes by the Society, were made; and during the afternoon the people mostly withdrew from the grounds, some of the cattle were taken away, and the gates closed upon a concluded exhibition—certainly, in Short Horn cattle, the most numerous in high bred excellence ever made in the United States.

Had we the time we might have made some observations on the comparative merits of the newly-imported animals with those bred in our own country, the descendants of those introduced many years ago; for here they were shown side by side, and the opportunity for comparison was favorable—but such remarks must be postponed to a future occasion. Suffice it now to say, that this exhibition closed under circumstances the most agreeable to those who attended it, and highly favorable to the improvement of our Western herds. Our only regret to be mingled with the pleasure we received was, that, owing to the lateness of the season, and the number of Agricultural Shows that had been previously held, the number of visitors was less than was anticipated, leaving the good citizens of Springfield, we fear, to foot

a bill of some three or four thousand dollars in expenses, over the receipts on the occasion.

In relation to this, although after suggestions are of little account, we can not but think, that had the local committee added horses, mules, asses, sheep, and swine, all of which are great agricultural staples thereabout, to their Exhibition, in their several classes, and made the premiums something less in individual amount, an increased interest would have been given to the show, and three times the number of people would have been brought together. But it was suggested that the National Show, at Springfield, Mass., last year, was of horses alone, and that this had better only include cattle. They should have recollected that this was eight hundred miles from the other, and that by scarcely a possibility could there be a duplicate of an article in each. We trust that in all future *National Exhibitions* of the kind—if they ever take place, and we trust they may—every dumb animal that draws breath, and is deemed worthy of cultivation, may be represented, and prizes awarded for superior excellence. So far as the testimony that we have to offer in relation to shows of this kind, where rival States may come in competition, we give it our decided approbation.

In conclusion, we have great pleasure in remarking upon the general good order that prevailed throughout the whole week of the Show, both on the grounds and off. The marshals of the ground were prompt and efficient in all their duties. The executive committee were obliging and liberal in every thing. Among them we should perhaps hardly particularize, when all were perfect in their several departments; but we can not omit to name Mr. Robbins, and the four brothers Warder, as models of urbanity, active, and executive talent, such as is rarely met with on such occasions.

GUANO.—A letter has been received at the Admiralty, from Commander De Horsey, of Her Majesty's ship "Devastation," dated August 1, 1854, reporting that he found three vessels under American colors at the uninhabited island of Aves, in lat. 15 deg. 40. min. 40 sec. north, long., 63 deg. 36 min. west, and one day's sail from St. Croix, shipping guano, of which he reports there is about 200,000 tons on the island, and but slightly inferior to the Peruvian.

TWENTY TONS OF HAY PER ACRE.

It will be recollected that at the late agricultural dinner at Mr. Mechi's, in England, which he annually gives to a numerous company of gentlemen, whom he invites to look at his crops at Tiptree Hall, Mr. Caird stated that twenty tons of hay had been grown on a single acre, in one season, in Scotland, from the Italian rye grass. The following is the grower's account of this great crop. It is a big story; but our readers must bear in mind that the Italian grass mentioned here is coarse and rank, and very much like the stalks of American rye; that it grows up rapidly immediately after cutting; that in the mild, humid climate of Scotland it starts early

in February, and grows well to the last of December; and furthermore, rich liquid manure in large quantities was applied to the land after every cutting. We doubt whether the hay was as dry cured as it would be in our hotter climate; and we may safely add, that no such quantity of hay could be made from an American acre.

Some persons have thought the grass for 20 tons of hay was grown in one crop, and have asked that question. It is not so. The grass may be cut from seven to ten times in 12 months; during the summer months, when the temperature of the atmosphere is high, a yard of grass in height may be grown in 21 days. In 1844, my first crop was cut early in March; the second, April 13th; the third, May 4th; the fourth, May 24th; the fifth, June 14th; the sixth, July 22d, with a crop of seed; here the liquid was used up and discontinued; three slight crops were cut afterward, but not dated. To this the public attention was called; the fact could not be denied, but every one accounted for it by some extraordinary advantage I had, they did not possess—to the vast quantity of liquid manure I had, they had not. No one said it was the fine land; all admitted the land to be very bad. Knowing that every one could do so who really tried, I foolishly appropriated a field of twenty acres to grow the grass to make into hay without the liquid, to convince the public that they could do so. I made the year's grass into hay upon the field before the public; 13 stacks, containing from 12 to 15 loads each, were erected. I was silly enough to make one crop in November (which was of course stacked at much cost)—a heap of manure; when the weather is not hot and fine, it takes longer to make the hay than to grow the grass, so that one is done at the expense of the other. [If I had removed the grass from the field directly it was cut, and made it elsewhere, that year's growth would have been little less than Mr. Talfer's statement. This did not convince agriculturists at large; anger was the result in many cases; but there were some who took the hint, and adopted the system of Mr. Kennedy, Mr. Telfer, and Mr. Harvey, and Mr. McCulloch, all Scotchmen, 300 to 400 miles off, while only one of my neighbors did so. Mr. McCulloch was brought from Scotland by Colonel McDouall to see a wonderful crop of grass grown upon a new system; therefore he was prepared to be surprised. Being taken into a field of grass of 14 acres, early in April, he expressed his surprise most heartily, saying it was a great sight, worth coming from the furthest part of Scotland to see; he had never seen anything in agriculture so wonderful. I asked him what he would say, then, if he were told it was the second crop this year; he said that he would not believe any man that swore it. Being taken down the field to the far end, he saw a wall of grass that convinced him at once of the fact that it was the second crop; he then said he would never disbelieve anything again.

I am now stating things in the presence of men living, to be contradicted if untrue. I grew as an experiment in my garden a patch of grass 5 feet 10 inches high, examined and measured by a committee of the House of Commons, with whom was Mr. Shaw Lefevre. I will not say what this crop weighed, although I know, lest I should damage the other facts I have stated; but I will state them when 7 to 10 crops are grown that weigh 8 to 18 tons per acre (English) according to the skill of the cultivator; that it shrinks only in the proportion from five to two in the open air in 12 days, it may be conceived how 20 tons of hay per acre

(Scotch being 1½ English) may be grown upon one acre of land; it may also be easily tried by any one very desirous to know, by getting from me, Mr. Kennedy, or Mr. Telfer, as much seed as will answer his experimental purpose for one acre, 4 bushels being the quantity.

Many other experiments have been made, too numerous to require you to insert, but one bearing particularly ought to be mentioned—it was how much land could 4 horses clear in 24 hours, running loose in a yard, without any other food and fed to the full. They cleared 7 yards by 5½; a piece of land just under 5 acres, kept from 70 to 100 horses in rack-meat during the spring and summer months, some of them eating four feeds of oats per day, and some no oats at all.

I have now sat down 90 miles from all my advantages, upon the poor land of the New Forest, to use up the remnants of my mind and body in agricultural pursuits. I shall make many blunders, but shall relinquish and correct them when I find them—shall, with the Divine blessing, endeavor to show that my Italian rye-grass can be grown as successfully upon the light land here, as it was upon the stiff clay of the London basin. It will be a great pleasure to me to find, while a pilgrim in this world, that my plant is grown, and my system adopted over the whole of my country with satisfaction and profit. In order to assist it, I shall publish a pamphlet of instruction with as little delay as possible, with instructions to carry it out at the cost of as few pence as possible, and place it in the hands of a vender, the profit of which, if any, will be applied to the soldiers' and sailors' orphan fund.

WILLIAM DICKINSON.

New Park, Lymington, Hants, Oct. 12, 1854

A CURIOUS STRUCTURE.

THE nest of a tarantula (spider) has been found in California, of most singular construction. It is about three inches in length, by two in diameter, the walls being nearly half an inch thick. Inside is a projection, which nearly divides it into two apartments about an inch in diameter. The inside is lined with a white downy substance, not unlike velvet, and presents one of the cleanest and most tidy little households imaginable. But the most curious part of it is a door, which fits into an aperture and closes it hermetically. The door is secured by a hinge, formed of the same fibrous substance as the lining of the house, and upon which it swings with freedom. The nest is occupied by a dozen little tarantulas, which seem to subsist upon a yellow secreted substance that appears upon the wall of the front apartment. The arrangement of the door for the protection of the little inmates indicates great instinctive architectural knowledge. It is the intention of the finder to forward this curiosity to the Smithsonian Institute at Washington.

[Youths' Penny Gazette.]

LARGE OR SMALL SEED POTATOES.

By an experiment carefully conducted at the North-American Phalanx, in Monmouth County, N. J., the following interesting results were obtained:

1. Large whole seed, 29 lbs. 14 oz., produced 174 lbs.
2. Large potatoes cut in halves, 15 lbs. 15 oz., produced 124 lbs.
3. Large potatoes cut in quarters, 7 lbs., produced 98 lbs.
4. Medium potatoes, whole, 19 lbs. 3 oz., produced 146 lbs.
5. Medium potatoes cut in halves, 9 lbs. 6 oz., produced 88½ lbs.

6. Medium potatoes cut in quarters, 4 lbs., produced 67 lbs.

7. Small potatoes, whole, 9½ lbs., produced 117 lbs.

8. Small potatoes cut in halves, 6 lbs., produced 84 lbs.

The percentage of small potatoes to the seed used was greatest on the quartered large potatoes.

The following figures indicate the value of marketable potatoes, at 50 cents per bushel, on an acre for each sort as above:

1.....	\$111 66	5.....	\$56 33
2.....	78 33	6.....	43 33
3.....	61 66	7.....	73 00
4.....	94 66	8.....	53 33

Repetitions of the experiment have all been in favor of the large uncut potatoes for seed.

[N. Y. Tribune.]

GOVERNOR HOPPIN (OF R. I.) AT THE CONNECTICUT SHOW.

IN our recent report of the Connecticut State Show, we alluded to the address of Governor Hoppin, and promised a synopsis of it, which we give below. It will be found interesting. Gov. Hoppin said:

Mr. President and gentlemen of the Connecticut State Agricultural Society: I have appeared before you to-day by invitation of your committee of arrangements, under circumstances of much embarrassment. The invitation to speak here was given to me last evening, while laboring under serious indisposition. I felt unwilling at that time to commit myself by giving an affirmative answer. I came to see—I came to listen and to be instructed, but I did not come to speak. This is not the only time that men have suffered by being caught in good company. I think for one that it would be a good plan for every man who holds an official position, and who is intending to leave home, to go prepared for such occasions, and to arm himself with speeches appropriate to public gatherings of various kinds.

Last evening I attended a Pomological Festival. It was the first I ever attended, and I was much pleased with it. While I was there I heard many hard names called over—some French names and some English names. There were New-Haven seedlings, and a great many others; but there were no Rhode-Island seedlings among them. I felt a little uncomfortable that my own State was not represented. But when I am here, and looking over this audience, I find that here there is a Rhode Island seedling. I am glad to see my State represented in the person of Henry A. Dyer, a Rhode-Island man, whose efforts in behalf of your Society have contributed to the brilliant success of this exhibition.

But not only on this ground do I claim a right to come before a Connecticut audience. I had once a relative—now no more—a dearly loved relative, who was a Connecticut farmer. He had a large farm and was an experienced farmer. Many here knew him personally and can testify to his worth. This makes me feel more at home. But beside all this, I myself have lived for the greater portion of my life in Connecticut. As a boy I have played beneath these elms, I have studied at your schools, I have graduated at your college. Here I commenced my professional career, and I may say, here I made the first and only good effort of my life at the bar. But I have still another right to appear before you. I married a Connecticut lady. [Laughter and applause.] That I may say was the crowning act of my life. [Renewed applause.] But I do not stop here. My good mother, whose ashes now rest in my own native State, and whose mem-

ory is dearer to me than the sunlight, was born upon Connecticut soil. These are my claims; and I ask, have I not established my right to appear before a Connecticut audience?

I have a deep interest in this Society from other causes. I attended recently an agricultural exhibition in Lawrence, Massachusetts. It was a noble display. I went there to see the big men and the big cattle. I was not disappointed. I come here to draw a parallel—not an invidious one, I hope—between that exhibition and this. Have you ever passed through Massachusetts? Have you ever visited her villages and noticed the state of agriculture? There is more done there in the way of agriculture than in any other State in the Union. The State shows it. The cattle show it—the men show it—the women show it. By nature their soil is poor, as poor as any other in the Union. It is far inferior to the soil of Connecticut. Now, in Massachusetts, all the great men take an interest in the state of agriculture. By great men, I mean the influential men, the wealthy and distinguished men. Why, in Lawrence, the other day, the gentleman who gave the address is reported to be worth a million dollars. His address, though excellent, was none the better for his wealth. I presume it was no better an address than will be given to-day by Gov. Dutton, who, I understand, is not worth half the money. [Laughter.] But I wish to say that when this cause is advocated by men of wealth, it must be good; not that wealth can give dignity to so noble a pursuit, but because it can bring to it and purchase for it innumerable needed facilities—because agriculture can ennoble wealth—and because, when the two shake hands, much of the prejudice that has existed in former times, to the injury of honest labor, is forever broken down.

In Rhode-Island, though we are a small State, we have done something according to our means. In every other department we are second to none. As was said the other day in an address, [by Rev. Wm. Clift of the *American Agriculturist*], which I had the pleasure of perusing, poor as portions of our seaboard soil are, there is a greater wealth in the State—in the soil and upon it—than in all the gold mines of California. I might say that there is, in truth, no such thing as poor land—that all land is good or bad as it is cultivated or neglected. But I prefer to say that, beside our valleys and hill sides and streams—beside many well cultivated farms and busy manufactories and work shops—we have, like Connecticut, men and women, of whom any State might be proud. A few years ago, Mr. President, it was the boast of Connecticut that she sent school-masters to Rhode-Island. Now, sir, we have school-masters among our exports. We send them to other and newer States, and could send them to Connecticut, if she needed them. We have lately furnished Massachusetts with a Governor, and Boston with a Superintendent of Public Schools. Our University boasts, also, of having educated the lately elected Senator from that State. Indeed, sir, as I remarked but a moment since, our wealth is in our people; and this wealth we prize above the precious ores of the East or the West.

But what, continued Gov. H., shall I say about Connecticut. We know what Connecticut can do. Look at her, with such a soil, such a climate, such a people, such resources, such ingenuity. And you have money in your treasury—more than you ought to have. That belongs to the people, and should be appropriated for them. How can it be so well appropriated as to promote the cause of agriculture?

Gov. H. alluded at some length to the dignity of the farmer's pursuit, and the import-

ance of the farming interest. We had not thought enough of these. The time had been when all labor, but especially the labor of the farmer was deemed disreputable—as detracting from the dignity and honor of the person performing it, if he chanced to possess dignity or honor. That time had gone by, and we are all thankful for it. But we do not think yet enough of the farmer's life. We do not realize our dependence upon his labors. We have not often enough asked ourselves, what would the walled city do, if cut from all communication with the country? What would become of its commerce, and all its grand display of wealth?

One or two things (said Gov. H. in conclusion) which I have seen, are especially worthy of notice. I have marked with pleasure the great order which has prevailed here. Here has been a crowd of twenty or twenty-five thousand people, but there has not been any disturbance or any confusion; there has been no rioting and no intoxication. Now here has been the best possible certificate which could be given to your Connecticut MAINE LAW. [Applause.]

STORING WINTER VEGETABLES

NEXT to growing, the proper preserving of winter vegetables, claims our attention. It is possible that so far as sorts and growth are concerned, the stock may be unexceptionable, which, when wanted for the table, they may be, if roots, dried and shriveled up—if the cabbage tribe, rotten. This is all for the want of proper storing. A good dry cellar is the best place for storing roots, such as carrots, beets, ruta bagas, parsnips, scorzonera or oyster plants, and turnips. If stored after the following manner, they will come out as wanted, as plump as when taken out of the ground.

The tender, such as carrots, beets and scorzonera, require taking up as soon as the leaves exhibit a yellow appearance, or before any very sharp frost, while parsnips may remain longer, as no frost injures them; in fact, except for use during hard weather, many leave them in the ground all winter. In taking up, care should be taken to get them out with the roots entire, or they are much more liable to rot, while some, as the beet, are materially injured in the cooking if mutilated. The tops should be trimmed off just above the crown, and the roots allowed to become dry before storing.

Procure some sand, which should be pretty dry, and lay a thin layer over the place the roots are to occupy. Now lay the roots evenly over this, placing a row all around the outside with the crowns outward. Place on sand sufficient to fill up all cavities and just cover the roots, and so on, alternate roots and sand till the whole is completed. They should not, however, be laid up to a greater height than about three feet.

Cabbage may be preserved in the cellar and in the open ground—the former for use during winter—the latter, after the frost breaks. Take a sheltered part of the garden, and open a trench, in which lay the cabbage bottom upwards; take out the next trench and lay on these, and so on. A few boards or a little straw should be sprinkled over them in hard weather.

Cauliflower and Brocoli, that have not headed before hard weather, should be carefully taken up, and laid in mould in the vegetable cellar or shed. In this way, this luxury may be had a good part of the winter.

Celery, all except the latest crop, should, just before the ground becomes hard, be lifted and placed in sand in the cellar, tops upward, a little slanting. This will be in use the greater part of the winter. The latest crop may remain in the ground well covered with straw. [Country Gentleman.]

THE VOICE OF AUTUMN.

BY W. C. BRYANT.

THERE comes from yonder height,
A soft repining sound,
Where forest leaves are bright,
And fall like flakes of light,
To the ground.

It is the Autumn breeze,
That, lightly floating on,
Just skims the weedy leas,
Just stirs the glowing trees,
And is gone.

He moans by sedgy brook,
And visits with a sigh
The last pale flowers that look,
From out their sunny nook,
At the sky.

O'er shouting children flies
That light October wind,
And kissing cheeks and eyes,
He leaves their merry cries
Far behind,

And wanders on to make
That soft uneasy sound,
By distant wood and lake,
Where distant fountains break
From the ground.

No bower where maidens dwell
Can win a moment's stay;
Nor fair untrodden dell;
He sweeps the upland swell,
And away!

Mourn'st thou thy homeless state,
Oh soft, repining wind!
That early seek'st, and late,
The rest it is thy fate
Not to find!

Not on the mountain's breast,
Not on the ocean's shore,
In all the East and West;
The wind that stops to rest
Is no more.

By valleys, woods, and springs,
No wonder thou should'st grieve
For all the glorious things
Thou touchest with thy wings
And must leave.

Graham's Magazine.

A DROP OF OIL.

The following suggestions are highly valuable:

EVERY man who lives in a house, especially if the house be his own, should oil all the various parts of it once in two or three months. The house will last much longer, and will be much more quiet to live in. Oil the locks, bolts, and hinges of the street-door, and it will shut gently, with luxurious ease, and with the use of a small amount of force. A neglected lock requires great violence to cause it to shut, and with so much violence that the whole house, its doors, its windows, and its very floors and joists, are much shaken, and in time they get out of repair in all sorts of ways, to say nothing of the dust that is dislodged every time the place is so shaken. The incessant banging of doors, scrooping of locks, creaking and screaming of hinges, is a great discomfort. Even the bell-wire cranks should sometimes be oiled, and they will act more certainly and with such gentle force that there will be little danger of breaking any part of them. The eastors of tables and chairs should be sometimes oiled, and they will move with such gentle impulse and so quietly that a sleeping child or old man is not awakened. A well-oiled door-lock opens and shuts with hardly a whisper. Three penny-worth of oil used in a large house once a year will save many shillings in locks and other materials, and in the end will save many pounds in even the substantial repairs of a house; and an old

wife living and sleeping in quiet repose will enjoy many more years of even temper and active usefulness. Housekeepers, pray do not forget the oil. A stitch in time saves nine, and a drop in time saves pounds.

The Builder.

APPLE MOLASSES.

THE juice of the sweet apple, it is probably known to most of our readers, makes an excellent molasses. The article, when properly made, is pure, possessing a vinous or rather brandied flavor, which renders it greatly superior for mince, apple or tart pies, to the best West India molasses. If it is made from sour apples, a small quantity of imported molasses may be added to modify the flavor. Beer made with it, possesses a brisk and highly rapid flavor, which common molasses does not impart. Four and a half barrels of good cider will make one barrel of molasses, costing in ordinary seasons, about \$5 50. One who has had considerable experience in manufacturing this article, says: "I make little cider; my apples are worth more to feed my hogs, than for cider; but I make a practice of selecting my sweet apples, those that furnish the richest, heaviest liquor, and make a cheese from them, using the cider thus obtained for making apple or quince preserves, boiling down for molasses, and keeping two or three barrels for drink or ultimate conversion into vinegar. When new from the press, and before fermentation commences, that which I intend for boiling is brought to the house, and boiled in brass, to the proper consistence, taking care not to burn it, as that gives the molasses a disagreeable flavor, and taking off all the scum that rises during the process. The quantity to be boiled, or the number of barrels required to make one of molasses, will depend greatly on the kind of apples used, and the richness of the new liquor. Four, or four and a half, are generally sufficient, but when care is not used in making the selection of apples, five barrels may be necessary, but let it take more or less, enough must be used to make the molasses, when cold, as thick as the best West India. When boiled sufficiently, it should be turned into vessels to cool, and from thence to a new sweet barrel, put into a cool cellar where it will keep without trouble, and be ready at all times.

[Republican Journal.]

LIQUID MANURE.

Surely a man must be mad to talk in this civilized age, of any one endangering his life by any statement he can make, however extravagant. Let any one who doubts the truth of Mr. Caird's assertion, made at Mr. Mechi's late gathering, and authorised by Mr. Telfer, try the following simple experiment: Take a cubic foot of dung from the middle of a manure heap, that has been drawn out into the field for the future wheat crop (any other may do, but the richer the heap the better). Wash it with water until it will not discolor the water it is washed in, and then dig it well into a square piece of ground in the field or garden, as may be most convenient, and sow a crop of any kind upon it. Take a second cubic foot of dung from the same heap, and as near the same place that the former was taken from as possible, and without washing dig it into a piece of ground the same size as the former, and of course the same quality. Then sow a crop of the same kind as the former, and afterward wait for both crops to arrive at perfection; whenever this condition of the two crops is obtained, the difference between them will, I think, settle all dispute about liquid manure.

J. R. MARKBY,

Duxford Rectory Cambridgeshire.

Horticultural Department.

A HORTICULTURAL NUISANCE.

WE notice that the Charter Oak grape is again widely advertised and puffed in the papers in this city—a regular thing by the way every autumn—as decidedly the “best” grape ever cultivated!

It has never received the favorable notice, that we are aware of, of any horticultural society. We are certain that no fruit grower, who had any reputation at stake, would recommend it as worthy of cultivation. We have had it two years in our garden, and it has fruited twice. If it took the name of Charter Oak from the resemblance of its pulp to that very rough wood, that name was not unworthily bestowed. We pronounce the Charter Oak grape an unmitigated humbug, and its sale to any man an imposition. We paid two dollars, cash, and gave two years of attention to the cultivation of the vine for our knowledge. Our readers now have what we know of it gratis. If they purchase that worthless shrub, they do it on their own responsibility.

THE HUMBUG OF MANY VARIETIES.

BY GEORGE JAKUES.

WE have, in our grounds, some three hundred pear trees, more or less, comprising about seventy varieties of the fruit. The trees are of such size as nurserymen usually retail at from one to three or four dollars apiece. Calling these trees worth five hundred dollars, in their present condition, if by some conjurer's art, their number of varieties could be reduced to about a dozen of what we consider the most valuable sorts, we should then estimate the same trees to be worth at least eight hundred dollars. In mercantile phraseology, Profit and Loss stands Dr. in the sum of \$300—to the reputation of having seventy instead of a dozen varieties of pears. In illustration of this amount of trash accumulated on our hands, we have among our trees the Lewis, the Passas du Portugal, Beurre de Mons and others about the size of blackberries, which—if they ever mortify us by fruiting again—we intend to eat with a spoon after the fashion of strawberries and cream, hoping only that we may have a great deal of cream and very few of the pears.

Next we have a class of pears beautiful as the fabled fruits of the Hesperides, but needing no hydra-headed monster to guard them against the depredations of those who have tasted them once. Of this class Chelmsford is a type, Pope's Scarlet Major another, the Reine des Poires another, &c., &c. Then we have a lot which “came highly recommended,” such as the Bleacher's Meadow, the Dunmore, &c., which our pigs always refuse, except on those occasions when his darlint of an Irish keeper has forgotten “intirely” to feed him for a day or two in succession. A fourth class were received under the prestige of such high-sounding names that we feel certain they must be something. But of this class we must sorrowfully say—“*stat magni nominis umbra*.” Their fine names contrasted with their miserable plight have been sneered at, at horticultural exhibitions, their owner's taste called into question, and their history

concluded by starving poor piggy into an appreciation of their otherwise latent excellence. To this class properly belongs certain winter varieties, which we shall designate as the shrivellers. Then comes some for which we paid smartly, among them, the Colmar d'Arenberg. This, we will admit, has proved tolerably palatable some years, but we do not think the pleasurable moments of our life would be much abridged if we and Colmar d'Arenberg were never more to meet in our mortal pilgrimage.

Again, we have from time to time become the proprietor of certain other “very new” varieties—cheap enough now—but so scarce when we purchased them that we were only able to purchase a single little miserable specimen tree—granted to us as a special favor at the moderate price of five dollars! The Grosse Calabasse heads the list of these; the Eyewood is not much too good to follow after, and—but we don't care to prosecute this subject further.

If the art of grafting has not lost its virtues next spring, we shall feel strongly tempted to put ourselves in a way to remain in blissful ignorance of all the rest of these same new varieties, and at the same time complete our education in regard to all the others above named.

We want pears that our friends and ourselves can enjoy—to eat, not to exhibit at horticultural fairs! What is it to be able to show a hundred varieties of pairs at an exhibition compared to having the finest and choicest of this fruit to set before one's friends! Where is the profit or honor, or pleasure, of these same varieties thus displayed, if the final destination of three-fourths of them is the pig-stye? And because, if our “more enterprising” (?) neighbor, Snooks, happens to get out one hundred and one varieties, he wins the laurels, and we are at once left in the lurch, with only the miserable consolation of going home to share with our pig in what other gratification our pears may be capable of affording.

As of pears, so in less degree of all our fruits. We remember to have paid a dollar and a half for the Carter grapes—a miserable savage tree from its native wood! Perhaps, though, we are too severe—having never actually tasted this fruit; for we do assure you, gentle reader, that we—that is, ourselves and our pig—have neither of us succeeded, up to these present writings, in getting the monstrous pulp of this grape far enough down our throats to be able to know how it would lie in our stomachs. Newland's strawberry we fortunately escaped; also several of the patent currants, &c.

We might go on this way through the whole circle of fruits and ornamental trees and plants, but we have already arrived in sight of an objection which we knew we should have to meet. We shall be asked: If some one had not experimented with new varieties, how would you have been supplied with such fruit as your Paradise d'Automne, Rostezier, Beurre d'Anjou; your Leland's Pippins, your Dutch Currants, your Hovey strawberries, &c., &c.? True, very true; but we think we can answer—at least interrogatively, after the most approved Yankee fashion.

If Columbus had never discovered America, how would our politicians ever have opportunity to manifest their benevolence in saving the Union? It is very well, it is important, indeed, that somebody should give attention to the raising and testing of new varieties of fruits; but is that any reason why every one who may have a bit of ground, should fill it up with all manner of new trashy fruits which nobody has fairly tested? The wholesale nurseryman, the wealthy amateur, horticultural societies who have experimental gardens, men

very fond of and willing to pay for distinctions at horticultural exhibitions, should be our experimenters, our pioneers on the western frontiers of horticulture. As for the rest of us, we can better afford to buy their experience than to take a share in it. If no better plan can be devised, let the members of the horticultural society each agree to test one or two new and different varieties in a season, and the work of improvement would progress rapidly enough for all valuable purposes. At any rate our dearly bought experience has taught us to be shy of the new varieties. We ought to be, we hope we are willing to do our part; but we confess we have not much enthusiasm for doing more. [Practical Farmer.]

GARDEN HINTS FOR THE SEASON.

Now that the busy time in this department is well nigh over for the present season, a good opportunity presents itself to make any needful improvements or alterations which past experience may have suggested.

The past season has been an excellent one for observing the wonderful effects of well drained, over wet, or under-drained lands, and should be a lesson to those who have wet lands to at once set about draining them.

Good hard walks are another necessary adjunct to a kitchen garden—walks that will be dry in all weathers, and sufficiently hard to bear the necessary wheeling on them. The slate rock certainly answers the best for this purpose of anything we know of in this neighborhood. It should be blasted and got in the fall, and if partially broken up and laid in heaps or on the walks themselves, will by the action of the sun and frost during winter, be nicely pulverized.

It is not an unfrequent occurrence to see kitchen gardens smothered up with fruit or other trees. This is a great evil, where a full supply of vegetables is required, as it is impossible to have top and bottom except it may be in a very few instances. If it is wished to have fruit trees within this department, they should be either espalier trained or the more modern pyramidal; at any rate they should be dwarf, and if planted to form a sort of avenue to the walks, they may be made to assume a pretty feature. But to look well in this place, they require to be kept in good order and properly trained, or they soon become too large for the place, and are often permitted to grow on until it is too late to keep them within the bounds of dwarfs, and because they bear some fruits, are allowed to remain to the great injury of the crops of vegetables.

ASPARAGUS.—This useful culinary vegetable should, as soon as the foliage is turning yellow, be cut off close to the soil, and the beds prepared for the winter. This consists in slightly forking up the soil, and spreading a coat of long manure all over the beds, three inches thick. The alleys should then be dug up and a portion of the mould from the alleys be scattered over the entire beds, which assists in keeping the manure in its place as well as making the whole look neat. In the spring the beds should receive a gentle forking and raking all over, as soon after the weather breaks as it can be worked. Some seed should be saved and cleaned, ready for sowing in the spring to fill up vacancies or make new plantations. With good care plantations will last many years.

Countrv Gentleman.

E. SANDERS.

GUILT, though it may attain temporal splendor, can never confer real happiness. The evil consequences of our crimes long survive their commission, and, like the ghosts of the murdered, forever haunt the steps of the malefactor.

THE PANSY.

If I was asked which of the florists' flowers I considered the most popular, I would answer, the Pansy. It may be found in the parterre of the nobleman, or the small flower plot of the cottager—in all parts of the empire, in the North as well as in the South. There is, perhaps, no other flower which has so repaid the labor of the florist. A few years ago it was a mere weed; now it is one of the most beautiful flowers we possess. If we compare the drawings of those which, four or five years ago, we considered gems, with some we now have, we immediately see the immense improvements that have been made; so much so, that when flowers such as these old gems appear now in our seedling beds, they are tossed aside as useless. For some time I have paid great attention to its culture, and have been pretty successful in competition; and if my method of cultivation should be of service to any of the readers of the Florist, and induce them to try it, I hope they will derive as much pleasure from so doing as I myself have done.

The pansy, I consider, is at its best during the last two weeks of May and the first two weeks of June. It is for this reason that the principal pansy shows are held during that period. The great object of the cultivator is to have his flowers in the highest state of perfection possible that can be had most easily and best, at that period when the flower is naturally at its best. No doubt good blooms of pansies may be had at almost any period from April to October, but there are many fine sorts, particularly belted ones, which during the height of summer entirely lose their true character, which scarcely any amount of cultivation can avoid; instance that fine old variety the Duke of Norfolk. As my principal object is to have my pansies in condition during May and June, I will first detail my method of doing so as minutely and as plainly as I can.

During July and August I take my cuttings, selecting young side shoots one and a half to two inches long. These I find always root soonest, and make the best plants. In many cases they can be got almost ready rooted, when they proceed from the parent stem at a little below the surface of the soil. It is a good plan, when many cuttings are wanted, to earth the main plants well up, thereby causing many of the side shoots to become ready rooted, or if not so they will very soon root after being put out.

My cuttings I put into a bed in the open border, attending to them well with water in the absence of rain. I shade until I see that they can bear sunshine without flagging; after that all the attention they require until potting time is to keep them clear of weeds, and have the soil stirred up occasionally.

I never use a hand glass in striking. The soil I find they luxuriate in is the top spit of a meadow, full of fiber, laid up in a heap for a considerable time, and well chopped over. To five parts of this I put one part leaf-mould, and one part well rotted cow-dung, adding a little sand to keep it open.

About the end of September I pot into 4-inch pots, putting plenty of crocks at the bottom of each pot for drainage. I then place them in a cold frame facing south, well up to the glass. When properly established in their pots, I give all the air possible, taking off the lights entirely in fine weather. In this manner I keep them over the winter, the only attention they require being to water well when dry (of course choosing moderately fine days for so doing), to throw a mat over the frame in severe frosts, and to give all the air possible in fine weather.

About the beginning of February I repot into 8-inch pots, without shaking the soil from their pots, but taking care to remove the

surface and what has been next the pot. I again put in plenty of crocks for drainage, and use the same soil as previously, which has been well turned over and exposed to frost during winter. After repotting I place them again in the frame, close up to the glass, and keep turning them round at intervals, so that the plants grow dwarf and equal, always remembering to give air on all possible occasions; in fine weather I remove the sashes entirely during the height of the day.

Those plants I wish to grow as specimens I tie out the side shoots to the sides, to pieces of wire with loops made by twisting them about two inches apart. These I fix underneath the rims of the pots. From plants from which I wish to take blooms for exhibition I remove most of the side shoots; some of them I grow to a single stem, some to two stems, but never more than three, according to the strength and nature of the plant. By the middle of April they become good plants, and many of them begin to show flowers. These I pick off until about three weeks before exhibition day, thereby throwing all growth into the plant. I now supply them liberally with well diluted liquid manure. I prefer sheep and cow-dung in the proportion of one peck of each to twenty-five gallons of water. This has the effect of increasing the size and brilliancy of the blooms.

As the blooms intended for exhibition begin to open, I draw a thin calico blind over the sashes during sunshine, and remove it immediately the sun is off. Pansy plants are very liable to become drawn if shaded for any length of time, therefore that must be avoided as far as possible. There is no occasion for any more shading than merely to keep sunshine from the blooms intended for exhibition.

If any blooms arrive at full perfection within three days of exhibition day, I take them off and keep them in water, taking care to change it frequently, and to shelter from dust, &c. I find they can be preserved in that manner in better condition than by being allowed to remain on the plant.

Little now remains to be done except to arrange the blooms on their stands. A little care here also is required. A fair proportion of each class ought to be put in; for instance, in a stand of twelve blooms there should be three white grounds, three yellow do., and three selfs; the white and yellow grounds ought to be broad and narrow belted, the selfs may be one yellow, one white, and one dark. The proportion of classes is very often, and ought always to be, taken into account by the judges; they ought also to be contrasted in the stands as much as possible, so that the dark flowers may give better effect to the light ones, and *vice versa*. To have a continuance of bloom during summer, plants should be put in the beginning of May and also in June. The side shoots taken off in April may be used for this purpose.

The pansy requires a good fresh loamy, soil and if the border is not naturally so, it ought to be improved by the introduction of good loam and well decayed dung. The best method, where it can be adopted, is to remove entirely eighteen inches from the border and make it up again with compost similar to that recommended for potting, or, what I have tried this season with excellent effect, thoroughly decayed rack, to which may be added a good quantity of decayed dung. If a situation shaded from the mid-day sun can be had, so much the better.

Attention similar to what is recommended above for pot plants must also be paid to these, so far as circumstances allow. For shading and protecting from dashing rains, small hand-glasses are useful. The plants must not be allowed to grow too bushy; three main stems are quite sufficient, if good sized blooms are wanted. Frequent appli-

cations of liquid manure will be found to benefit these also.

Without doubt the system of cultivating pansies in pots for spring blooming has immense advantages over that in the open border, and I would earnestly recommend all who have any wish to succeed at the spring exhibitions to adopt it. The grower in pots is entirely independent of his garden soil, if unsuitable, in a great degree of situation, and of weather. It is very disheartening after the attention of months in preparing for an exhibition to find that by a deluge of rain all hopes of successful competition are blasted. In frame culture the plants are safe from rain, wind, and weather. In conclusion I subjoin a list of thirty varieties, which I know are really good, having grown most of them, and had opportunities of seeing the remainder in bloom. Intending purchasers may select from it with confidence:

POPULAR SIMILES.

Some ingenious rhymist has placed the following sayings in poetic order—the opposites in juxtaposition:

As wet as a fish—as dry as a bone;
As live as a bird—as dead as a stone;
As plump as a partridge—as poor as a rat;
As strong as a horse—as weak as a cat;
As hard as a flint—as soft as a mole;
As white as a lily—as black as a coal;
As plain as a pikestaff—as rough as a bear;
As tight as a drum—as free as the air;
As heavy as lead—as light as a feather;
As steady as time—as uncertain as weather;
As hot as an oven—as cold as a frog;
As gay as a lark—as sick as a dog;
As slow as a tortoise—as swift as the wind;
As true as the gospel—as false as mankind;
As thin as a herring—as fat as a pig;
As proud as a peacock—as blue as a grig;
As savage as tigers—as mild as a dove;
As stiff as a poker—as limp as a grove;
As blind as a bat—as dead as a post;
As cold as a cucumber—as warm as toast;
As red as a cherry—as pale as a ghost.

Wisdom does not show itself so much in precept as in life—in a firmness of mind and a mastery of appetite. It teaches us to do, as well as to talk; and to make our words and actions all of a color.

One of the greatest evils of the world is, men praise rather than practice virtue. The praise of honest industry is on every tongue, but it is very rare that the worker is respected more than the drone.

American Agriculturist.

New-York, Wednesday, Nov. 8.

We hope none of our readers will be deterred, by its length, from reading the report of the National Cattle Show, commencing on the first page. It gives not only a general report of the show itself, but is also an index to the best lots of improved cattle in our country. The remarks upon the general arrangements and the incidents connected with the show, and the critical notices of the different kinds and lots of stock, will interest those not specially engaged in rearing cattle nearly as much as those who are. As the writer is not present to make corrections, there may be one or two errors or omissions.

CHEAP LABOR UNPROFITABLE.

THE man who employed an artist at five hundred a year, to engrave pillars, &c., on half dimes, at the rate of half a score a day, that he might pass them for sixpences, is said to be on the verge of bankruptcy.

Not unlike, in its result, is the experience of a friend of ours, who last Spring hired a boy, at some nine dollars a month, when good help was worth eighteen, happy in the prospect of having his work done at half price. Passing through his cornfield, a day or two since, we were surprised to find him harvesting a piece of some three-quarters of an acre, and to satisfy our curiosity upon one or two points, he gave us the following statement:

Last Spring, in the hurry of planting, a circus was advertised in the neighboring village, and Jim, of course, must go. In order to propitiate his employer, he proposed taking a stint; and, unfortunately, it happened to be the covering of this piece of corn. It was well manured, and to make the sprouting of the seed certain, it was necessary to spread the manure in the hill, and cover it with dirt, before dropping the corn. Jim did his work, boy fashion, and was off to the circus. Two weeks after, when the corn should have been up, only here and there a spire appeared. It was planted over, and came forward just in time to be pinched by the drouth; and this economist will get ten bushels of corn, instead of forty. A net loss of at least twenty-five dollars by the operation, has taught him that a man may be penny wise and pound foolish.

Cheap help is no where more costly than upon the farm. A bungler, at the bench or forge, may get new material, and do his work over again a fortnight hence; but two weeks with the farmer may lose him the season.

STATE POULTRY SHOW.—The New-York State Society for the improvement of Domestic Poultry, are to hold their second annual exhibition at Utica, on the 28th, 29th and 30th of this month. Premium lists, and any information desired in respect to the exhibition, may be obtained by addressing D. S. Heffron, President, or R. U. Sherman, Secretary of the Society, Utica.

NEW-JERSEY MARL.

WE learn of a good movement on the part of the Monmouth County Agricultural Society, at their meeting on the 21st ult. We refer to the appointment of committees to procure good specimens of marl, from different parts of the County, to be forwarded to Prof. Cook, who is engaged in the State Geological Survey, for examination.

The committees consist of Jamès S. Lawrence, and Wm. Armstrong, of Upper Freehold; Dr. J. C. Thompson, and Wm. Armstrong, of Manalapan; Judge Forman, and Thomas Baird, of Millstone; Horatio Ely, and Thomas Vanderveer, of Freehold; Uriah Smock, and H. S. Conover, of Marlborough; Peter S. Conover, and P. R. Smock, of Raritan; W. H. Hendrickson, and Thos. Roberts, of Middletown; Isaac Hance, and Michael Taylor, of Shrewsbury; Benj. W. Corlies, and Judge Barclay, of Ocean; R. K. Shafto, and Capt. Brannin, of Wall; John B. Williams, and Judge Simpson, of Howell.

We hope these committees will exercise great caution in their selections, so as to get average samples. When a large bed is to be tested, it is desirable that considerable quantities should be taken from different parts of it, and these several samples thoroughly mingled together, and the specimen to be used taken from the mass. We are led to make this suggestion, because we have had many specimens of manures, marls, &c., sent us for examination, which could yield no practical results, because they were not an average of the whole mass to which the examination was designed to apply.

The Society appointed a committee to prepare a statement of the results of the use of marl in the County. The members of this committee are, Messrs. B. F. Randolph, Charles Sears, and Jas. S. Lawrence. The following resolutions were also adopted:

Resolved, That persons who have had an analysis of their marl heretofore, in the County, are respectfully solicited to send a statement of the same to the President or Secretaries of the Society, stating the time when and by whom made, the place where, and what part of the pit the marl was from, and whether the marl is used, and with what results.

Resolved, That the subject of marl be considered at the next meeting, in January, and that the farmers from all parts of the County are hereby requested to present at that meeting a statement, written or verbal, of their own experience in the use of marl, and of any matter of interest connected with the use of it.

CHANGES AMONG OUR EXCHANGES.

WE learn that the Rev. Wm. Bidwell, for a long time editor and proprietor of the New-York Evangelist, has been compelled to retire from his post, on account of impaired health. The Evangelist will hereafter be under the charge of Revs. Wm. Bradford and Henry W. Field.

WE are very sorry to learn of the suspension of the Windham County (Conn.) Telegraph, on account of some legal difficulty between its late and former proprietor. While lecturing in that vicinity, we, with

others, became quite indebted to the Editor, Mr. Francis E. Harrison, for his successful efforts to secure the advancement of agricultural intelligence. The Telegraph has labored unceasingly to arouse a spirit of "home public spiritedness," and to promote the agricultural as well as other interests of Windham County, and we hope its present suspension will be of short duration.

T. L. McElrath & Co. have played a capital joke upon the Harpers, in copying the cover of their magazine and using it upon the Household Words. This is done in return for the issuing, by the Harpers, of an opposition edition of Dickens' late popular work, "Hard Times."

Household Words, for November, is an excellent number, and in Harper's neat cover, is quite as good as the "genuine magazine."

NOVEL PREMIUM.—A GOOD IDEA.—At the anniversary of the Norfolk County (Mass.) Agricultural Society, at Dedham, a premium of \$2 was awarded to Miss Mary Quincy, of Dedham, for a very neatly mended stocking. The committee also made some complimentary remarks, by way of encouraging young ladies to cultivate this very useful art.

For the American Agriculturist.

WHAT WILL MAKE A COW GIVE DOWN HER MILK?

THE inquiry in the *American Agriculturist*, "What will make a cow give down her milk?" reminded me of an incident in my own experience.

We have a fine cow, which goes by the name of Whitey, on account of her color. She gives a large quantity of milk, and of superior quality. Her only fault is, that she is rather too intelligent, and knows too well how to look out for her own interests. She is evidently in favor of bovine rights, and has no idea of submitting, against her judgment, to the control of man or woman. She can let down the bars of the pasture very nicely, if there are no precautions taken to prevent it; and if the fence is not "legal," she does not consider it worthy her regard. She understands the mysteries of latches and hooks; and, if she has a calf to look after, she knows very well how to retain a sufficient portion of her milk for its nourishment.

Bridget had been with us several weeks, and I had always given her particular instruction to treat the cow gently, and never strike her. One day she came to me, and told me that Whitey would not give down her milk. She had tried for some time, and could not get a "sup." I had known the cow so long, that I had learned if she was coaxed with a bucket of delicacies, she would, for a time, forget her calf, and not refuse to yield her milk.

"Unto the milkmaid's hand; while in regular cadence, Into the sounding pail the foaming streamlets descended." So I told Bridget if she would "slop" the cow she would have no difficulty. She went out, and pretty soon came in again.

"How have you succeeded this time?" I

inquired, expecting her to show me a pail of foaming milk.

"Oh, ma'am," she answered dolorously, "I slobbered her all about the barn-yard, and I could get na-ary a drop."

"Slobbered her about the barn-yard! What does she mean?" I said to myself. I inquired into the matter, and found she had been "bating" the cow.

"Why did you do that?" I asked. "I have often told you never to strike her."

"But you said, ma'am, if I would slobber her, she would give down her milk."

So poor Whitey had had a beating, and Bridget had no milk, because I had used an expression which I had frequently heard, but which she entirely misunderstood. If I had told her to give the cow "a mash," she would probably have known what I meant.

After suitable explanations, Bridget tried a third time, and with much better success. She prepared some food which the cow liked, and as Mooly was not slapped, she stood still, and gave down her milk, Bridget wisely concluding that the way to a cow's heart, as to a child's, is through the mouth.

ANNA HOPE.

ASHLEY'S HITCHING-ROD.

We commend the following to the attention of our readers:

For the American Agriculturist.

I send you a rough sketch of Ashley's Hitching-Rod, thinking you might like to show it to your numerous readers.

As you will see at a glance, it is a very simple contrivance for fastening a horse so that he can neither damage his harness, by rubbing his head against the post, nor bite the bark from a tree, if he happens to be fastened to one.

The Hitching-Rod is a simple rod, twenty inches long, of half an inch round iron, with a ring at A, to be firmly strapped to the post, and a ring and clasps at B, to fasten to the bit. It may be permanently attached to a post, by a common staple, or it may be carried in the carriage to be used as required.

Any gentleman who has a fine tree ruined by a gnawing beast, or has seen the maiden beauty of a new harness destroyed by being rubbed and bruised against the hitching post, will appreciate the value of this simple invention.

A CONSTANT READER.

NEW-BEDFORD, Aug. 18, 1854.

WHERE DO PLANTS COME FROM?

Two hundred pounds of earth were dried in an oven, and afterwards put into a large earthen vessel; the vessel was then moistened with soft water, and a willow tree, weighing five pounds, was placed therein. During the space of five years, the earth was carefully watered with rain-water or pure water. The willow grew and flourished; and to prevent the earth being mixed with fresh earth, or dust blown into the pot, it was covered with a metal plate, perforated with a great number of holes, suitable for free admission of pure air only. After growing in the earth for five years, the willow tree was removed, and found to weigh one hundred and sixty-nine pounds and about three ounces. The leaves which fell from the tree every autumn

were not included in this weight. The earth was then removed from the vessel, again dried in the oven, and afterward weighed; it was discovered to have lost only about two ounces of its original weight. Thus one hundred and sixty-four pounds of lignin or woody fiber, bark, etc., were certainly produced from the air.

Scrap-Book.

"A little humor now and then,
Is relished by the best of men."

A COW SUIT.

All who have a taste for native shrewdness and humor, and who wish to have a good, hearty laugh, should read the following. There is scarce any thing in Pickwick equal to it. The blood of the old Puritan stock tells well here. Allington and the May Flower, will henceforth be immortal. See the fifth paragraph from the close of the article.

This was one of the most amusing trials ever witnessed by bench or jury in this county. The prisoner was indicted for an assault and battery upon a man by the name of Dodder. It seems that a Plank Road had just been laid in the town of Minisink, running through the lands of said Dodder, and that Allington is the toll-gatherer, and that the gate-house is built upon, or adjoining the lands of Dodder. The other facts will appear in the evidence.

The cause was duly opened by the District Attorney, when his Honor, the Judge, noticed the defendant sitting within the bar, with pencil in hand ready to take down evidence, without counsel.

"Have you no counsel, Mr. Allington?" inquired the Judge.

"No Sir."

"There are plenty of gentlemen around you who would be willing to assist you."

"Well, your Honor, I have feed one, and engaged another, and they both turn up missing, and therefore I have concluded to try the case myself."

"Very well, sir."

The District Attorney, after stating the case to the jury, called the complainant, Mr. Dodder, upon the stand, who testified as follows:

I know the defendant; he is a neighbor of mine. I was driving his cows off my land, when he came out upon the road and stoned me. He sent as many as a dozen at me, and the last one struck me upon the back of the neck. It hurt me considerable—not very badly, however, as the rim of my hat hung down, and it and the coat collar prevented.

"You can examine him now, Mr. Allington," said the District Attorney.

All eyes were now turned upon the defendant. There he sat, busily engaged in taking notes, a little, short, red-headed, red-faced Yankee, with his feet resting on the lower round of the chair, and his body bent forward at an angle of 45 degrees. At that remark he snapped his head back like a blade in a jack-knife, his eyes twinkled, and in a shrill, loud voice he commenced:

"Have you been on good terms with the defendant, I mean me, Mr. Dodder?"

Dodder hesitated.

"Come, Mr. Dodder, have we been on good terms?"

"I can't say," replied Dodder.

"Well recollect, Mr. Dodder, that you must say."

"Say yes or no," interposed his honor.

"Yes or no," responded the defendant.

"I can't say that we are on speaking terms," answered Dodder.

"Well, Mr. Dodder, you say that I struck you with a stone—will you please state to the jury whether it was the first stone that struck you?"

"No sir."

"Did it not go fifteen feet to the right?"

"About that."

"Well was it the second?"

"No sir."

"Did not that go three feet over your head?"

"Yes, sir."

"Were you not running after my cow with a stake sharpened at one end? and did you not knock her down? and was it not because you would not stop that I sent the other stone at you?"

"Well, sir, I must explain."

"None of your rigmaroles here, Mr. Dodder. No explanations, sir—Yes or No, sir."

"I can't answer."

"You must answer. Come, sir, Yes or No."

"It wasn't a stake, it was a stick."

"Yes, two and a half inches at the butt and twelve feet long."

"No, sir, one inch across and tapering to the end."

"You knocked the cow down, didn't you?"

"I struck at her—can't say I struck her."

"Didn't she fall?"

"Can't say."

"Well, Mr. Dodder, you were chasing her, were you not?"

"I was in the road, sir, and she was on the side."

"Was it icy?"

"Yes."

"Snow deep?"

"Yes."

"Now, will you say, on your oath, Mr. Dodder, that you did not strike her?"

Witness hesitating. "I will not be positive."

"Well, Mr. Dodder, were you not coming toward me?"

"Yes, sir."

"You was coming up the road and I was going down?"

"Yes, sir."

"You did not run back at all, did you?"

"No, sir."

"You are sure you did not look or go back, are you?"

"Certainly I am."

"Are you as positive of that as you are of all the rest you have sworn to?"

"I am, sir."

"Well, sir, will you then please to inform this jury and myself how that stone came to strike you on the back of the neck?"

Witness was evidently non-plussed, and a roar of laughter burst from bench, bar and jury, as well as the spectators.

"I am not done with you yet," exclaimed the defendant, as Mr. Dodder seemed rather uneasy and inclined to vacate the chair.

"Whose house do I live in, Mr. Dodder?"

"I consider it mine."

"Did you serve a notice on me not to use the rooms, the garret or the cellar, when I was moving in it?"

"Yes, sir."

"Was there any thing else to use, sir?"

"No, sir."

"Who built the house?"

"The Plank Road Company."

"In whose possession is it, Mr. Dodder?"

"Plank Road Company."

"How did you come to say that the house was yours, when the Company have it in possession and built it?"

Another burst of laughter followed this question and poor Dodder looked as if he was sitting upon a hatchet. Dodder gave no reply.

"Now, Mr. Dodder, have you not been trying to get me out of that house, that you might get your son in my place? And have you not been to the Directors? and have you not applied to them for your son? and have you not told them things derogatory to my character?"

"None of your long preambles, Mr. Dodder; you know it is so, and I am going to prove it, too. Yes or No."

"I can't answer; I must explain."

"No explanations, sir—Yes or No."

"No."

"Did you not go to three of the Directors?"

"Yes."

"Did you not order a window put in the cellar of the house, when building, and say you wanted it there for your son's accommodation?"

"I might have done it."

"Did you not get a warrant out for me before I was bound over to appear here?"

"Yes."

"Did you not then swear that I had only assaulted you by throwing stones, but did not hit you?"

Dodder was completely staggered again—he changed all manner of colors, and moved about very uneasily in his chair.

"Come, Mr. Dodder, answer," exclaimed the defendant.

"I can't remember."

"Yes you do—come, think—did you then swear I had hit you at all, sir?"

"I might not."

"How comes it that you remember it now—three months after—and could not then?"

This was too much for poor Dodder. He looked appealingly around for relief. Nothing met his gaze but a room convulsed with laughter. His legs seemed to be under magnetic influence, and in a great desire to try their powers of locomotion. At last the defendant told him to go. "That will do, Mr. Dodder—I guess we are through with you for the present." And off he shot as if death was behind him; while the whole bar fairly screamed, as he made awful strides down the aisle, and the Court buried their faces in their handkerchiefs and shook convulsively.

Dodder No. 2 was then called—son of the old Dodder—who testified as follows:

"I was in the house—heard a noise—saw father driving cows; saw defendant come out of his house and throw stones; I ran out and a hill was between me and them, and when I got up all was over. Saw defendant throw three stones—did not see any strike."

Cross-examined by defendant.

"You were in the house, you say?"

"Yes."

"Is there not a hill twenty feet high between your house and where I was?"

"About that."

"How many stone walls, also—about four?"

"About that."

"How many plank-fences or slab-fences—two?"

"Only one, I think."

"Well, sir, how could you see through four stone walls, one slab-fence, and a hill twenty feet high? That will do, sir; you can go."

And without waiting for a reply, off went Dodder No. 2.

Distriet Attorney, on the part of the people here rested.

The defendant, then, with all the gravity becoming such an important occasion, untwisted his legs from the rounds of the chair, and with more than usual dignity walked out in front of the jury, and offered his defense as follows:

"If you please, your Honor, and Gentlemen of the Jury—I am a green hand at this ere bizziness. I am ashamed that such a

little, small consairn should ever come before an Orange County Jury. It was not my wish, I am sure. I was taken up once before, and then he only swore to an assault; but three months' thinking has put the battery to it. I acknowledge the assault, but I am justified, for he was assaulting my cow. He has tried to pick a quarrel with me ever since I went to the gate. He stones my cows, my chickens, and I can't stand it. I threw the stones; I admit it—first, fifteen feet to the right, then over his head and when I saw the cow fall as he knocked her down, then I did shave him, but I didn't hit him, and that ain't all, I'll prove it; and I ask you farmers, if you would not do the same thing? I can prove he knocked her down by my brother.

Defendant's brother was then called, and stated, that it was Sunday when the occurrence happened; saw complainant, Dodder, running after and striking at defendant's cows. Saw him strike and one fall—can't say he struck her. Defendant ran out and hallooed to him—did not mind. Defendant then threw three stones; none hit him, I went out, and when I came up to Dodder he said defendant had thrown stones at him, but he had managed by jumping and dodging not to have any hit him.

The testimony here closed.

The defendant then proceeded to sum up the cause. His honor dropped his pen, the jury leaned forward, the members of the bar were winking and nodding across to one another, and a universal tittering pervaded the room. He commenced, and his sharp, shrill voice drowned all else:

"Gentlemen of the Jury—This is the first time I was ever in such a pickle—never did I before appear before a jury of my country. This Mr. Dodder has brought me here, and I have to appeal to you, not knowing whether you are Woolly Heads, Silver Greys, Hard Shells or Soft Shells. Yet I think this Dodder will find out before I am through that I am a harder shell than he imagined.

You know, gentlemen, that I am in the employ of the Mongaup Valley, Forrestburg and Port Jervis Plank Road Company, as a gate-keeper. This Company it seems had sufficient confidence in my integrity and honesty to place me in that important station, and even if I should receive \$3,000 and steal \$1,500 of it, that's between me and the Company, and its none of Dodder's business. Now when the Company sent me up along this road to collect tolls, *this Dodder* was one of the *inhabitants I found there in the woods*, and I will say for him that he is a very fair specimen of the rest of the population. But there isn't any of them, that seem to appreciate all the benefits of this Plank Road.

It let out to civilization a class of people who never before had the idea there was such a thing as civilized life, and *this Dodder is one of them*. It is a fact that soon after I moved up there, a young woman, 16 years old, cum down out of the the mountains on the Plank Road, one day, and she had never been out before. She fairly seemed surprised to see a *white man*, and after asking a few questions went back into the woods. This Dodder was my nearest neighbor, and a good deal nearer than I wanted him, and I hadn't been there long, before I heard that he had been lying about me to one of the Directors, and I soon found out that he wanted to get his son, who was sworn here against me, in my place. But he hasn't done it yet, and if you don't convict me I reckon he won't very soon.

It won't take long to dispose of Dodder No. 2. He testifies that he saw me throw three stones at his father, and saw the "old man dodge." On cross-examination he says that he was in his own house *in the woods*, and had to look over a hill twenty feet high, and also over three slab-fences and two stone

walls. Well! if he tells the truth all I wish is that I had young Dodder's eyes. He is certainly a remarkable boy and can't deny his "*father*."

I am willing to admit that I done wrong to throw stones at Dodder, and I apologise to all the world and this county particularly, for it. The Doctors tell us that there are two causes for all diseases, predisposition and excitability. I think it was the latter cause that moved me to stone Dodder.

I therefore confess myself guilty of the assault, but the battery I *deny*! and if you find me guilty of the battery I will appeal from the decision to the Court of high Heaven itself before I will submit to it.

Now, Gentlemen, you saw Mr. Dodder and heard him swear upon me. I asked him a great many questions and I was sorry to hear him answer as he did. I might have asked him more questions—I might have asked him if he didn't stone my chickens, because they trespassed in his woods, where actually the rocks are so thick that the cats can't find their way up through them; but then I knew he would deny it, and it would grieve me to hear him. He admits that he was driving my three cows up the road, and that he struck at one of 'em, but says it was with a small switch. I have proved that this switch was a pole, about 10 feet long and about 2 inches across the butt end, and I have also proved that when he struck, the *cow fell*. It is true my witness couldn't swear that the stick hit her, he was so far off, but take the blow and the fall together, and we can guess the rest. If you, gentlemen should see me point a gun at a man and pull the *tricker*, see the flash and heard the report, and at the same time see the man drop, I think you would say that I shot him, although you might not see the ball strike him.

Now, the fact is, gentlemen, that on Sunday, I was lying on my lounge in my house, when my wife said that Dodder was chasing my cows. I jumped up and the cows coming up the road. It is true he says he wasn't driving them, but says he and the cows were both going along the road in one direction. and this was as near as I could get him to the cows or to the truth; but it is proved that the cows were going along ahead of him, and he was following after them, striking at them, with his little switch, 10 feet long and 2 inches across the butt, and I reckon you'll think he was "driving" them. I sung out to him, "Dodder, stop!" but he didn't obey my order, and I just threw a stone in that direction, which went about 15 feet over his head; at the same time going toward him. He paid no attention, and I sung out again, "Dodder, stop!" Still he didn't mind me, and then I just threw another stone; but on he came, and on I went, and I threw the third stone, which he says hit him in the back of the neck, but which I think is rather strange; as we were going toward each other as fast as we could go. But he never slackened up, and by this time we were within about eight feet of each other. I halted and hallooed at the top of my voice, "Dodder, why don't you stop!" about then he did stop and raised his 10 feet switch, as if to strike me. I sang out—"Mr. Dodder, look out! You may wollup my cows, but if you wollup me with that swith, you'll wollup an animal that'll hook?" [Here the orator made an appropriate gesture of the head, as in the act of hooking, which was followed with tumultuous shouts and laughter, that continued several minutes.]

Now, gentlemen, if you convict me, this Court can fine me \$250, and *jug* me for six months, and if you really think I ought to be convicted of this assault, *say so*, for I am in favor of living up to the laws, as long as they are laws, whether it is the Fugitive Slave Law, the Nebraska Bill or the Exeise

Laws. I will read you a little law, however, which I have just seen in a book I found here—(the speaker picked up a law book and read as follows:—"Every man has a right to defend himself from personal violence." Now I don't know whether that is law or not, but I find it in a law book, [a veteran member of the bar who was sitting near the speaker, remarked to him that it was good law.] Well, gentlemen, here is an *old man*, who looks as if he might *know something*, and he says 'tis good law. Now if you will turn to Barbour something, page 399, you'll find that the same doctrine is applied to *cattle*—(great laughter.) Therefore I take it I had a right to defend my cows against Dodder's 10 foot switch. Why, gentlemen nearly all my wealth is invested in them three cows, and you can't wonder that I became a little excited when I saw Dodder switching them with this 10 foot pole. I am a poor man, and have a large family, consisting of a wife and six children, which I reckon is doing very well for so small a man as I am, and I could not afford to let Dodder kill my cows!

Now, gentlemen, I don't believe you'll convict me, after what I have said. But if you do, and this Court fines me \$250, I shall "repudiate" because I "can't pay." And if I'm jugged for six months, why these Dodders will have it all their own way up here. But notwithstanding all this I am willing to risk myself in your hands, and if you think I ought to have stood by and not done anything, when I saw Dodder hammering my cows, why then I am "gone in," toll-gate and all.

It is true, I am a poor man, but not a *mean* one. The name of Allington can be traced to the May Flower, when she landed the pilgrims on Plymouth Rock; among the passengers was a widow, Mary Allington, with four fatherless children, and I am descended from that Puritan stock; and from that day to this, there has never lived an Allington who hadn't Yankee spirit enough to stone a Dodder for poling his Cows. *I'm done.*

Roars of laughter, during which the defendant took his seat. After a few words from his Honor the Jury retired, and in a few moments returned with a verdict of *Not Guilty*.

Old Dodder and Dodder No. 2, were at that instant seen plunging down the stairs leading to the court-yard with unbounded powers of locomotion; when the yard was gained they fairly ran, and it is supposed never stopped until the deep woods of Minisink hid them from the gaze of men.

Allington heard the verdict with the sang froid of a philosopher. No emotion, other than the turning his quid of tobacco in his mouth, and an extra squirt of juice was observable.

It may be as well to remark, that the District Attorney refused to be pitted against his eloquent opponent, and let the cause go by default, as he said not a word in reply to the speech of his opponent. The District Attorney was in a tight place, and took the wisest course to get out. It is not often he meets with such formidable prisoners.

We dined out the other day, says a cotemporary, with a citizen who enjoys a good joke. Among others, he related one of a Yankee and a Dutchman, who, when discussing politics, wound up on the relative merits of Seward and Bouck, both ex-Governors of the Empire State. Says Yankee, "Bouck has not so long a head as Seward." "Vell," says Dutchy, in a huff, "Py zounds, Seward's head is not half so thick as Bouck's."

EXERCISE.—A young lady who was recommended to take exercise for the benefit of her health, said she would *jump* at an offer and *run* her own risk.

MORN—NOON—NIGHT.

MORN calleth fondly to a fair boy straying
Mid golden meadows, rich with clover dew;
She calls; but he still thinks of naught save playing,
And so she smiles and waves him an adieu!
While he, still merry with his flowery store,
Deems not that morn—sweet morn—returns no more.

NOON cometh—but the boy to manhood growing,
Heeds not the time. He sees but one sweet form—
One young, fair face from bower of jasmine glowing,

And all his loving heart with bliss is warm.
So Noon, unnoticed, seeks the western shore,
And man forgets that noon returns no more.

NIGHT tappeth gently at a casement gleaming
With the thin firelight flickering faint and low;
By which a gray-haired man is sadly dreaming
Of pleasures gone as all life's pleasures go.
Night calls him to her, and he leaves his door,
Silent and dark—and he returns no more.

HINTS TO POETS.

WE are overwhelmed with poetry. Either the drouth has not touched the Castalian fount, or the autumn rains have swollen it. Much of the poetry that comes into our hands is written upon such delicate paper, and with such elegant penmanship, and is accompanied with such modest notes from virgin authors, that we are at our wits' end to know what to do with it. How can we decline publishing what is prepared with so much pains, and is proffered with so much delicate consideration? In order to recover our judgment sufficiently to decide upon the queries of elegant rhyme-paper before us, we beg that the Muses will be more sparing of their favors for at least two months to come. And for the guidance of those who meditate such favors for us in the future, we beg leave to submit the following hints: 1. Do not take a psalm tune and make a jingle of words match it. Greenville and Coronation are capital tunes; but they do not always inspire good poetry. 2. Do not take a rhyming dictionary and select a row of words, and then *prefix* syllables to make out the requisite number of feet. Poetry constructed upon that principle usually requires to be read backwards. 3. Do not take a foot rule and measure off inflated prose into blank verse. This is apt to confuse the reader as to the proper use of capitals and the pauses of the sentence. 4. Do not exhaust the adjectives and interjections of the English language upon rhymes against Senator Douglas and the surrender of Burnside. Turn your rhymes into votes. 5. Never send us anything "upon the recommendation of judicious friends who desire to see it in print." 6. After composing, lay aside your piece until the intoxication of the first inspiration has subsided. Keep it a month, and then read it over. 7. Do not be mortified that your piece is not published; but take it for granted that you would be more mortified if it was. [Independent.]

MISNOMERS.—Everybody has heard of the gentleman who described his country seat as having a "lemonade" in front a "porto-risco" to each wing, a "pizarro" in the rear, with an "anecdote" by which the water was conveyed into a "resurrection" in the "erie." If we had ever heard of that gentleman's having taken up his residence south of Mason and Dixon's line, we should have no doubt that he was identical with the one who, as a Louisiana correspondent narrates, has thus announced, some contemplated architectural improvements:

"I contend," said he, "among other 'pusilanimous' things, to put a 'diselcure' around that field, plant a 'harbor' in the middle,

and cut a 'revenue' up to the door. And then when I have built a 'perdition' to my house, I shall be able to receive my friends in a 'hostile' manner."

THE HOMBRE AND THE SHOWMAN.—A ludicrous scene occurred a short time since on one of our most frequented wharves, of which, perhaps, you may not have heard. It seems some hirsute hunter had captured a huge grizzly bear up among the mountains somewhere, and, intent upon "realizing" something out of him, had duly caged him, brought him to the city and placed him on exhibition in a room opening, we will say, upon Pacific wharf. Over the door he posted in conspicuous letters, the "legend" (as Phoenix would have it,) "Large Bear—the largest ever caught—Admission 50 cents." An unsophisticated, rawboned, long-legged, lank, Pike County man, fresh from the mines (excessively verdant—and matter of fact—and independent, withal,) in shuffling down the street, read the sign and thought he'd like to look at the "critter." So he paid the admission fee, and, after satisfying his curiosity, went on his way. The day after, one of our German fellow citizens opened the very next room to that where bruin was on exhibition, and posted over his door a sign on which was printed in huge capitals, "Lager Bier." Our Pike County friend sauntered long-leggedly down the street soon afterward, and was thunderstruck when he read the new sign. "Larger Bear!" said he, "Larger Bear!—why, dog-dern that other feller's eyes—he said *his'n* was the largest bear ever ketch'd—I've been *swindled*!" and as wrathful as Achilles, he made one rush for bruin's exhibition room, swept in like an ungainly thunderbolt, regardless of admission fee, and, without one word, pummelled our worthy friend, the hunter, almost to death, and utterly cleaned him out." [California Mag.]

WHAT BOOK?—"My Lord, I appear before you in the character of an advocate from the City of London. My lord, the City of London herself appears before you as a suppliant for justice. My lord, it is written in the Book of Nature—" "What Book?" said Lord Ellenborough. "The Book of Nature." "Name the page," says Ellenborough, holding his pen uplifted, as if to note the folio down.

SWITCHING OFF.—"Boys," said a village pedagogue, "what is the meaning of all that noise in the school?"

"It is Bill Sikes, sir, who is all the time imitating a locomotive."

"Come up here, William; if you have turned into a locomotive, it is high time you were switched off."

BACKBITER.—"What is the meaning of a backbiter?" said a reverend gentleman during an examination at a parochial school. This was a puzzle. It went down the class till it came to a simple little urchin, who said, "Pr'aps it be a flea."

A SUICIDAL SUPPER.—A man dying of apoplexy, in Michigan, the jury of inquest returned the following true and sensible verdict: "Died from a visitation of one beef steak, eight cold potatoes, and a fried pie."

AN advocate having lately gained a suit for a poor young lady, she remarked, "I have not anything to pay you with but my heart." "Hand it over to the clerk, if you please. I wish no fee for myself," he replied.

PARADOX.—An American sailor, although the first to give a blow, is the last to strike!

AMERICAN AND EUROPEAN HORSES.

BADEN-BADEN, Sept. 25th, 1854.

WE were talking of exporting American horses to Europe. After considering the price in various countries, expense of transportation, risk, &c., the principal motive, after all, must be a preference for your own country horses—without which the thing is hardly worth while. I confess to such a preference, having immense faith in their endurance, and the quantity of work to be got out of them, on the one hand, and their docility on the other. The latter is perhaps what astonishes the French the most, though they do not look upon it as an unmixed good in a horse; and perhaps a fair share of the difference is to be attributed to the different styles of driving, as your Frenchman will never let his beast go naturally, but must be fussing at him with whip or curb, to make him prance or show off in some way. But whatever be the reason, I am persuaded that the combination of speed and power, with perfect docility, is rarer in the European than in the American horse. Under the saddle, our animals (I speak of the Northern horses) have some obvious and serious faults, pulling too much on the bit, stumbling, cantering on the wrong leg, not knowing how to leap; but all these are the result of their education, or want of education. We are such a nation of *drivers*, that there is no adequate demand for superior saddle horses, or indeed for any horses *exclusively* devoted to the saddle—as a saddle horse, to be *really* a saddle horse, should be.

Be it said, too, of our horses, that if they sometimes make a rider anxious by stumbling, when they *do* fall, it is not with so much damage to themselves as a European horse experiences. In eight years' riding American horses, I have had four falls; on no occasion did the horse hurt himself enough to leave a mark of any kind, or to lose two days' work. Of English horses, I never owned but two; they both tumbled down with me—not on bad ground, either, but on perfectly smooth and level roads—and both broke their knees.

Talking of English horses, did you ever notice a prejudice that the English have against mares for harness? They consider them vicious and unsafe. From the extent of the prejudice there must be some foundation for it; and if so, it is another point to be put down to the credit of our animals, since with us mares are just as quiet in harness as geldings, and many of our sporting men *prefer* mares to drive.

One sometimes hears a good deal of the Russian trotters, but I never met a Russian who, after having seen our "flyers," did not acknowledge their superiority. A Muscovite Prince in Paris imported a pair of fast horses from our country last spring, at a high figure—I believe chiefly to breed from. They were a brown and light bay, about 15½ hands high, and made a very respectable looking team, though not remarkable for beauty. The brown was a sister of Highland Maid, but neither her appearance nor gait reminded me of her distinguished relative. I liked the bay much better, and was told she turned out better on trial, having gone her mile (near Fontainebleau) in "2:40," with about 300 lbs. behind her. The Prince remained *incognito* several months in France, at no small personal risk, solely to get his purchases in order for the overland journey home. After that, he deserves that they should turn out well.

Spirit of the Times.

CARL BENSON.

It is absurd to speak of the "seat of war," for the war can hardly be said to have a seat while it is at a stand still.

Good character is above all things else.

THE FARMER'S GARDEN.

A few days since, I chanced to take dinner at the house of a farmer. It was the season of the year for early peas, beans, potatoes, lettuce, &c., and finding none of these luxuries on the table, being naturally inquisitive, I inquired the reason of their absence, when the answer that most readily suggested itself was presented: "We have no time to attend to such small matters," i. e., the garden. Now is this any excuse for a mere weedy patch, with the fence inclined to an angle of forty-five degrees, instead of a good garden with a neat fence around it, so managed and arranged that every vegetable of a wholesome quality for human food should be raised in it in perfection and at the earliest seasons. No portion of the farmer's time can be more valuably improved than in the cultivation of the garden. The interest of the farmer, the comfort of his family, the good condition and health of his whole household, require such a garden on every farm in the country.

Why may not every farmer in the State have every kind of vegetable on his table as early as any gardener near the city can raise them? There is not a single reason why he should not, while there are a great many why he should. The gardener has to incur a very considerable expense in procuring hot manure for his hot beds, while the farmer has it in his barn-yard. The gardener has everything to purchase and draw a considerable distance, while the farmer has nothing to buy, &c. Some people are forever harping upon the assertion: "We have no time to attend to such small matters," and yet it may safely be asserted that an acre of ground, appropriated to a good garden, will be more profitable to the farmer than any other ten acres of the farm. These very people are fond enough of such things when they go to the city, and it is not, therefore, a want of taste. Nor is it for want of time, for this class of men often spend time in unnecessary slumber, or what is worse, repair to the store or tavern, or some other place of resort, and lounge away those hours in idleness and dissipation which might be improved in attending to "such small matters." It is simply the fault of negligence; for it would only be a source of amusement during winter, for him to construct the frame of a hot-bed, and prepare the manure and the bed for use. Having done this, and got his plants in a thrifty state, he can, in a short time, when the season arrives, get his garden ground in order and make his plantations. And then he will have all the vegetable luxuries as early as any of his town friends can purchase them. The expense that he would incur would be a mere trifle. The small quantity of lumber required is probably rotting on his premises. It only requires a little industry and attention to accomplish this, and, as said before, his enjoyments, his health, and even his interest, as well as the comfort of his family will be benefited by it. Besides this, the natural appetite calls for it, and there are few pleasures that may be so safely and beneficially indulged in. And, in conclusion, I am free to say, that when I am at a farm-house, when vegetables are properly in season, and find none of those luxuries on the table, nothing but the blue beef, salt pork and beans or potatoes of winter, I do not envy that farmer nor his family their enjoyments.

EVERITTSTOWN, 1854.

D. M.

Dollar Newspaper.

Why is the circulation of blood sometimes suspended? Because it attempts to circulate in rain!

Keep your own secrets, if you have any.

I'LL DO IT WELL.

It is said that there lives in New-England a gentleman who gave the following interesting account of his own life. He was an apprentice in a tin manufactory. When twenty-one years old, he had lost his health, so that he was entirely unable to work at his trade. Wholly destitute of means, he was thrown out upon the world, to seek any employment for which he had strength.

He said he went to find employment, with the determination that whatever he did he would do it *well*. The first and only thing he found that he could do, was to black boots and scour knives in a hotel. This he did, and did it well, as gentlemen now living would testify. Though the business was low and servile, he did not lay aside his self-respect, or allow himself to be made mean by his business. The respect and confidence of his employers were soon secured, and he was advanced to a more lucrative and laborious position.

At length his health was restored, and he returned to his legitimate business, which he now carries on extensively. He has accumulated an ample fortune, and is training an interesting family by giving them the best advantages for moral and mental cultivation. He now holds an elevated place in the community where he now lives.

Young men who may chance to read the above statement of facts, should mark the secret of success. The man's whole character, of which I have spoken, was formed and directed by the determination to do whatever he did, well. [Credit lost.]

THE WIFE.—It needs no guilt to break a husband's heart. The absence of content, the muttering of spleen, the untidy dress and cheerless home, the forbidding scowl, and deserted hearth—these and other nameless neglects without a crime among them, have harrowed to the quick the heart's core of many a man, and planted there, beyond the reach of cure, the germ of dark despair. Oh! may woman, before the sight arrives, dwell on the recollections of her youth, and, cherishing the dear idea of that tuneful time, awake and keep alive the promise she so kindly gave.

MODERN GREASE.—The growth of commerce in Cincinnati exceeds anything recorded of commercial progress. In 1826 the entire value of her exports and imports did not exceed four millions. In 1854 the value of her leading articles of export and import exceed one hundred and ten millions; and if the unenumerated articles could be included, would probably reach one hundred and fifty millions.

A YOUNG GIANT.—There is an individual at present in Greenock, named Patrick Murphy, the Irish giant, a lad of eighteen years, of the extraordinary height of seven feet five and a half inches in his stockings. Weighs twenty-one stone, (294 pounds,) and measures fifty-two inches round the chest. Murphy is a native of the County Down, Ireland.

A GENIUS in New-Bedford is fitting up a steamer for the purpose of towing icebergs to India, where they sell for six cents per pound. Another proposes to do still better: to fit a screw to the berg itself, and thus avoid the expense of ship building. We go in for the latter arrangement.

NEVER run in debt, unless you see a way to get out again.

Avoid temptation through fear that you may not withstand it.

POULTRY SALE AT THE AMERICAN MUSEUM.

The "rare fowls," noticed last week, were sold at auction on Saturday. We learn that the prices obtained were far below the original cost. The fowls sold as follows:

One pair of Mandarin ducks, \$150! one pair of White swans, \$100; one White female swan, \$50; one Black Female swan, \$60; one pair of Black swans, \$99; one pair Japanese peacocks, \$100; one pair of Barnacle geese, \$40; three pair of Hoop-bill ducks, \$75; one pair of Golden pheasants, \$18; four pair of English pheasants at \$10, \$11, \$15 per pair; three male Golden pheasants at \$5, \$8 50, \$12 50, each; three male Silver pheasants at \$10, \$10 50, and \$16 each; one pair of Call ducks \$12; one Sheldrake duck, \$10; three Spoon-bill ducks, \$13; one pair of Pintail ducks, \$5; one pair of Widgeon ducks, \$12; one pair of Widgeon ducks, \$7; 3 Widgeon ducks, \$9; one pair of Gray Dorkings, \$10; 3 do., \$15; six Seabright Bantams, in two lots, \$5 each; two do., hens, \$2 each; three Golden do., \$1 87 each; three English bantams, \$1 25 each; three do., \$2 37 each; four Bramah Pootras, one cock and three hens, \$2 50 each; one Poland hen, \$1 25; one Bolton Gray hen, \$1 25; one pair of Golden Hamburgs, \$2 25; one pair of Black Spanish fowls, \$10; one pair of do., \$5 50; two Black Shanghai hens, \$3.

TURKEYS.—one pair of beautiful White turkeys, \$5.

GESE.—Two pair of Barnacle geese, \$12 and \$14; two pair of Egyptian geese, \$10 and \$16.

BRINGING UP CHICKENS WITHOUT A MOTHER.—When they are hatched, they must be placed in a box six or seven feet long, and covered with a hurdle, in order to learn the use of their feet and wings. We give this box the name of chicken nursery; it should be placed in the middle of a dung-heap to give them warmth, and small vessels placed in it with suitable food. To supply the chickens with the warmth they would find from couching under the hen, we place in the box a sort of desk, like a reading-desk to stand on a table, and we cover the interior with a lamb's skin, (I should say make only the sides and back of wood like this, and nail an artificial mother, of lamb's skin or wool, on the top.) They soon learn to run under, and thus keep their backs warm, a thing which is very essential. When the chickens begin to grow large, they are admitted to the poultry-yard. [Poultry Chronicle.]

Markets.

REMARKS.—Flour remains unchanged.—Corn has advanced from 5 to 6 cts. per bush. Pork has fallen about 50 cents per barrel. Beef is a little lower.

Cotton is $\frac{1}{2}$ to $\frac{1}{4}$ c. per lb. lower. Sugar is $\frac{1}{4}$ c. per lb. higher.

The weather continues favorable, though so cold as to make ice for two nights past.

PRODUCE MARKET.

SATURDAY, November 4, 1854.

The prices given in our reports from week to week, are the average wholesale prices obtained by producers, and not those at which produce is sold from the market. The variations in prices refer chiefly to the quality of the articles.

THERE has been a very sensible change in the weather since the last rain, and this morning it is quite cold. The effect is very apparent on the market, which is crowded with produce and purchasers of all kinds.

We quote the prices to-day about the same, with a slight falling off in the lighter kinds of produce. Turnips begin to come in quite plentifully, and are lower. We saw some of the genuine vegetable Marrow squash, so

highly prized in Boston. The wholesale price is about \$3 $\frac{1}{2}$ per 100 lbs.

The market is well supplied with apples, and the prospect is that they will continue abundant. The most common kinds are Gilliflowers, Spitzenbergs, Baldwins, and Greenings.

Eggs are a shade higher. Butter and cheese, same as last week.

VEGETABLES.—Potatoes, Mercers, \$3 @ \$3 50 $\frac{1}{2}$ bbl.; White, \$2 50 @ \$2 75; Sweet, Philadelphia, \$2 75 @ \$3 25; Virginia, \$2 50 @ \$3; Turnips, White, \$1 22; Russia, \$1 25 @ \$1 50; Beets, \$3 75 @ \$4 $\frac{1}{2}$ hundred bunches; Carrots, \$3; Parsnips, same; Cabbages, \$5 @ \$7 $\frac{1}{2}$ hundred; Celery, \$1 $\frac{1}{2}$ dozen.

FRUITS.—Apples, \$1 50 @ \$1 75 $\frac{1}{2}$ bbls. Cranberries, \$6 @ \$8.

Butter, State 22c. @ 24c. $\frac{1}{2}$ lb.; Western, 18c. @ 19c.; Eggs, 21c. $\frac{1}{2}$ doz.; Cheese, 10c. @ 11c. $\frac{1}{2}$ lb.

NEW-YORK CATTLE MARKET.

MONDAY, NOV. 6, 1854.

There is to-day an advance of about $\frac{1}{4}$ c. $\frac{1}{2}$ lb. over the previous week, owing, no doubt, to the favorable change in the weather. The market, though somewhat more lively, is yet dull, the brokers finding it difficult to bring the butchers to terms; and, considering the quality of their stock, it argued no little presumption to ask the prices they did. Many of the animals, in fact, were quite spare, and looked as forlorn and rough as though they had done nothing all summer but brouse.

Best quality is selling at 9 $\frac{1}{2}$ @ 10c. $\frac{1}{2}$ lb.
Fair do. do. 8 $\frac{1}{2}$ @ 9c. do.
Inferior do. do. 7 $\frac{1}{2}$ @ 8c. do.

Some of the brokers claimed they were getting, for the best, 10 $\frac{1}{2}$ c.; they meant, we suppose, that they were asking it.

We notice to-day 71 Chester County, Pa. steers, belonging to H. Underwood, and sold by C. G. Teed. These were fair cattle, of uniform size, and selling from 9c. @ 10c. $\frac{1}{2}$ lb.

One hundred and twenty-two cattle, from Clarke Co., Ky., and owned by Castleman & Humphreys. These were fine Western cattle, and selling at 9c. @ 10c. $\frac{1}{2}$ lb. Estimated to weigh 700.

Eighty-four Chester Co. cattle, owned by Killough & Harlan and sold by John Merritt. Good quality, and wanted but a little more feeding to make them right. They were selling from 9c. @ 10c. $\frac{1}{2}$ lb. and weighed about 800 lbs.

Messrs. White and Ulery had 250 Chester Co. cattle, in different yards. Of these, some were in excellent condition, and selling for about 10c.

Ninety-eight Kentucky cattle, from Montgomery Co., owned by F. Ferguson, and sold by Geo. Toffey. Estimated to weigh about 750 lbs., and selling at 8 $\frac{1}{2}$ @ 9c. A few sold for 10 $\frac{1}{2}$ c., weighing 950.

Sixty-four Chester Co. steers, owned by Daniel Barnes, of the same place, and selling at 9 @ 10c. Weight about 675 lbs.

The following are about the highest and lowest prices:

Beeves 7 $\frac{1}{2}$ c. @ 10c.
Cows and Calves \$30 @ \$60.
Sheep \$2 @ \$7.
Lambs \$1 50 @ \$5.
Veals 4c. @ 6c.
Swine 4c. @ 4 $\frac{1}{2}$ c.

Mr. Chamberlain reports beeves, 7c. @ 10c.; cows and calves, \$20 @ \$60; veals, 5 @ 6 $\frac{1}{2}$ c.; sheep, \$2 @ \$6 50; lambs \$2 @ \$4 50.

Mr. Browning reports beeves, 7 $\frac{1}{2}$ c. @ 9 $\frac{1}{2}$ c.; cows and calves, \$25 @ \$50; veals, 5 @ 6 $\frac{1}{2}$ c.; sheep \$2 @ \$8; lambs, \$1 50 @ \$4 50.

Mr. O'Brien reports beeves, 7c. @ 9c.; cows and calves \$25 @ \$45; veals, 5c. @ 6 $\frac{1}{2}$ c.

Washington Yards, Forty-fourth-street.

A. M. ALLERTON, Proprietor.

The sheep market has greatly improved the last week, and promises to be much better for the future.

Mr. Samuel McGraw, Sheep Broker at Browning's, re-

ports sales of 1616 sheep and lambs, sold during the past week for \$4,867 01, in the following lots and prices:

104 Sheep and Lambs,	\$227 50
83 Sheep,	187 00
340 "	1086 74

100 taken for Demarara market		
50 Lambs,	\$2 25	10
25 "	3 37 $\frac{1}{2}$	11

The market the early part of the week was very dull; but on Friday there was a decided improvement in both price and demand, and the prospect at present is flattering. The week closes with a limited supply on hand, and the demand fair. Mutton sold, by the carcass, in Washington Market, the early part of the week, from 2 $\frac{1}{2}$ c. to 7c. $\frac{1}{2}$ lb.; on and since Friday prices have advanced from 1c. to 2c. $\frac{1}{2}$ lb., as in quality. Lambs from 5c. to 10c. $\frac{1}{2}$ lb.

Advertisements standing three months one-third less.
Ten words make a line.
No advertisement counted at less than ten lines.

TO HORTICULTURISTS.—A person who has been engaged in Horticulture for the last twelve years, will shortly be disengaged, and desires a situation in an extensive Nursery, or in connection with a Horticultural or Agricultural Periodical. Can give satisfactory reference as to ability, &c. Address S. KINGESSING, Philadelphia, Pa.
Refer to A. B. Allen, Office of the American Agriculturist. 61-73.

A PAIR OF FINE COACH HORSES for SALE.—Sixteen hands high, long tails; one six, the other seven years old; color gray. These horses are warranted kind, sound, strong, and enduring. They are offered for sale for no fault, but simply for not wanting their use the ensuing winter. They can be had for \$350, which is very cheap for them. Such horses are oftener sold at \$500 or \$600 in this city. Apply to
F. WOODFORD, 191 Water-st., N. Y.

RASPBERRY PLANTS, of the PURE RED ANTWERP stock, for sale in quantities to suit purchasers. The plants are all warranted, and in a thrifty condition, and will be delivered in New-York for \$50 per thousand.
VALENTINE H. HALLOCK, Poughkeepsie, N. Y.

P. S.—Orders by mail will be promptly attended to, and no charge made for package. Orders to R. L. ALLEN, 189 and 191 Water-st., N. Y., will receive prompt attention. 60-1f

CY FOWLS.—Shanghai Fowls—direct importations—and Spangled Hamburgs, for sale by
WM. DAY, Morristown, N. J.

IMPROVED SHORT HORN BULL FOR SALE.—The subscriber offers for sale his superior Short Horn Bull, PRINCE ALBERT, that won the second prize at the recent State Fair held in the City of New-York. Prince Albert was calved in 1849; his pedigree is of much merit, in color, he is a deep red with white marks; intemper, extremely mild and easily managed. He is an excellent stock-getter, and would not now be offered for sale, but that the subscriber, in the system of breeding he has adopted, has no further need of his services.

Under these circumstances, he is for sale at the low price of three hundred dollars. The animal may be seen at Ellerslie farm, one mile south of Rhinebeck station. Address personally, or by letter,
WILLIAM KELLY, Ellerslie, Rhinebeck.

ANDRE LEROY'S NURSERIES, AT ANGERS, FRANCE.—Mr. Leroy begs to inform his numerous friends that he is now prepared to execute all orders for TREES, EVERGREENS, SHRUBS, STOCKS, &c., entrusted to his care.

His Trees, &c., are very fine this year, and his collection very complete. Orders should be sent at once, so as to secure the different kinds. The best care will be given to all orders, as usual. The Angers Quince Stocks have not succeeded well this year, and are scarce and high.

Orders should be addressed to our agent in New-York, Mr. EDWARD BOSSANGE, No. 138 Pearl-st., who will give all the information desired, and mail, on application, free of charge, a detailed copy of my catalogue, with prices, in dollars and cents. 60-72

TREES AND PLANTS.—PARSONS & CO., Flushing, near New-York, offer for sale their usual assortment, with the addition of many rare novelties of Fruit Trees, for the Orchard and the Garden; Ornamental Trees, Shrubs, and Roses, for the Avenue, Lawn, or Cemetery; Vines for the Grapery, and Exotic Plants for Greenhouse culture. Catalogues can be obtained at No. 60 Cedar-st., or will be sent by mail to all post-paying applicants enclosing a postage stamp. 23-71

1,000 ORNAMENTAL TREES FOR SALE.—\$100—Suitable for Belts, Masses, Shrubberies, Woods, &c., in the best and hardiest varieties, strong and well grown—delivered in Boston and New-York. Price list on application.
B. M. VATSON, Old Colony Nurseries, Plymouth, Mass. 36-63

IMPROVED ESSEX PIGS.—The subscribers are now ready to engage pigs from Fall litters, got by their superior Boars, LORD WESTON and UNCLE TOM. Prices—\$25 per pair; \$15 a single pig.

Also, the subscriber has a lot of five from a Spring litter, which won the first prize at the New-York State Show this year; consisting of three boars and two sows. Price—\$20 each. In all cases the money must be forwarded before shipment of the pigs; which will be well boxed, and sent by express or otherwise, as desired.
W. P. & C. S. VAINWRIGHT, 59-62 Rhinebeck, Dutchess Co., N. Y.

MULES FOR SALE.—The subscriber keeps constantly on hand 400 to 500 MULES, of all sizes. Among these are some of the choicest animals in the United States; 16 hands and over in height, and well proportioned.

Mules are almost the only working animals used in portions of the Southern States, the West India Islands, and Spanish possessions where severe work and hard usage are allotted them, and under which horses would soon die. An equal advantage would follow their introduction among farmers and others, in the northern States. They are not only much harder than horses, but they will draw more in proportion to their weight; will endure a great deal more; live twice as long, and eat less; and the only dressing or currying they need, is a soft plane to roll on. They are gentle, tractable, and easily managed; and nobody who has ever tried them will ever give them up for horses or oxen.

Call on, or address by letter, JAMES BUCKALEW, Jamesburg, New-Jersey.
Refer to Amos Chamberlain, Bull's Head, 24th-st., N. Y. 39

SUPERIOR SEED WHEAT.—A LARGE assortment of the best varieties of improved Seed Wheat; among which are the Red Mediterranean, White Mediterranean, Soule's and Blue stem.
For sale by R. L. ALLEN, 189 and 191 Water-st.

FANCY FOWLS FOR SALE.—A variety of pure bred Fowls, Asiatic, Spanish and Game Fowls, Sebright, Black African, Antwerp, and other Bantams.
B. & C. S. HAINES, Elizabethtown, New-Jersey 54-1f

SUPREME COURT.—In the matter of the Staking of lands for a new Reservoir, between Eighty-sixth and Ninety-sixth streets, and the Fifth and Seventh avenues in the City of New-York.

To all owners, mortgagees, lessees, occupants, and other persons, in any matter, by judgment, decree or otherwise, entitled unto, or interested in the lands or premises above mentioned, or any part thereof.

Notice is hereby given that you are required to appear before the Commissioners of Appraisal in the above entitled proceeding, at the office, No. 233 Broadway, the third story front room, at 10 o'clock, A.M., on any day (Sundays excepted) on or prior to the 21st day of October next, and to produce the evidences to your title or interest therein. In default thereof, and in case the person entitled or interested as aforesaid shall not be ascertained by or be known to the said Commissioners, or be fully known, the same will be reported to the Supreme Court as belonging to unknown owners.

It being the desire to consummate this great improvement, and to present the report at the earliest day consistent with proper examination, and due regard to rights and interests affected, it is earnestly requested that all parties note and comply with the preceding notice, as no other or further notice will be issued.

Dated New-York, September 1, 1854.
EDWARD C. WEST, ABRAHAM TURNURE, } Commissioners.
DANIEL DODGE.

ROBERT J. DILLON, Counsel to the Corporation.
N.B.—All papers published in the City of New-York are requested to publish the preceding notice until the 21st day of October next, once in each week, and to send their bills, with affidavits of publication, to the office of the Counsel to the Corporation, to be paid on the final taxation of the proceedings. 57

STATE OF NEW-YORK.—Secretary's Office, Albany, August 10, 1854.—To the Sheriff of the County of New-York:—Sir: Notice is hereby given that at the GENERAL ELECTION to be held in this State on the TUESDAY succeeding the first Monday of November next, the following OFFICERS are to be ELECTED, to wit:

A Governor, in the place of Horatio Seymour;
A Lieutenant-Governor, in the place of Sanford E. Church;
A Canal Commissioner, in the place of Henry Fitzhugh; and
An Inspector of State Prisons, in the place of Henry Storms;
All of whose terms of office will expire on the last day of December next.

A Representative in the Thirty-fourth Congress of the United States, for the Third Congressional District, composed of the 1st, 11th, 14th, 15th and 17th Wards in the City of New-York; for the Fourth District, composed of the 14th, 15th, 16th and 17th Wards of the City of New-York; for the Fifth District, composed of the 15th and 16th Wards in New-York, and the City of Williamsburg in Kings County; for the Sixth District, composed of the 15th, 16th and 17th Wards in the City of New-York; for the Seventh District, composed of the 15th, 16th and 17th Wards in New-York, and for the Eighth District, composed of the 15th, 16th and 17th Wards in New-York.

County Officers also to be selected for said County:
Sixteen Members of Assembly;
A Surrogate, in the place of Alexander W. Bradford;
A Recorder, in the place of Francis R. Tillou;
A City Judge, in the place of Welcome R. Beebe;
A Mayor, in the place of Jacob A. Westervelt;
A Register, in the place of Garret Dyckman;
A Commissioner of Streets and Lamps, in the place of George G. Glazier, who was appointed to fill a vacancy caused by the resignation of Henry Arcularius;

A Police Justice for the Second District, in the place of Daniel W. Clark, who was appointed to fill a vacancy caused by the death of John McGrath;

Two Governors of the Alms House, in the place of Gustavus A. Conover and William Pinckney, appointed to fill vacancies.

A District Attorney, in the place of Lorenzo B. Shepard, who was appointed to fill a vacancy caused by the death of Nathaniel B. Blunt.

A Civil Justice and a Police Justice for the Seventh Judicial District, composed of the 15th, 16th, and 17th Wards;

A Police Justice for the Eighth Judicial District, composed of the 15th and 16th Wards.
Yours respectfully,
E. W. LEAVENWORTH, Secretary of State.

SHERIFF'S OFFICE, New-York, Aug. 14, 1854.
The above is published pursuant to the notice of the Secretary of State and the requirements of the statute in such case made and provided.

JOHN ORSER, Sheriff of the City and County of New-York.
The above public newspapers in the County will publish the above notice in each week until the Election, and then insert in their bills for advertising the same, so that they may be laid before the Board of Supervisors and passed for payment. See Revised Statute, volume 1, chapter 6, title 3, article 3, part 1, page 140.
[33-60] JOHN ORSER, Sheriff.

PERUVIAN GUANO.—First quality of Fresh Peruvian Guano, just received in store.
R. L. ALLEN, 189 and 191 Water-st.

WILLARD FELT, No. 191 Pearl-street.
(near Maiden-lane.) Manufacturer of Blank Books, and Importer and Dealer in PAPER and STATIONERY of every description. Particular attention paid to orders. 26-77

MACHINE WORKS.—M. & J. H. BUCK & CO.'S Machine Works, Lebanon, N. H., Manufacturers of a great variety of wood working Machinery, of the most approved style, simple construction, and effective and firm operation, to be found in the country; comprising complete sets for making Railroad cars, doors, sash and blind, ship-building, bedsteads, cabinet, and carpenter work, &c. &c. Also, some machines of peculiar merit, such as for single and double Tenoning, capable of making from one to four tenons at the same operation of any width, size, or length, on large or small timber, with revolving cylinder attached. Also, an improved timber Planing Machine, with the addition of a side cutter, with which the top and edge of timber or plank is planed, whether square or bevel, at the same operation, and in the same time occupied in planing but one side on all other machines. They also manufacture circular, single, and gang Saw Mills, Flouring and Corn Mills, hand and power Hoisting Machines for storehouses, Shafting, Hangers, Pullies, and Mill Gearing of all patterns.

MARTIN BUCK, J. H. BUCK, F. A. CUSHMAN, WM. DUNCAN.

AGENTS—R. L. Allen, 189 and 191 Water-st.; S. B. Schenck, 168 Greenwich-st.; Andrews & Jessup, 67 Pine-st.; Lawrence Machine Shop, 51 Broad-st., New-York, and Lawrence, Mass.; Leonard & Wilson, 60 Beaver-st., and Wm. F. Sumner, Crystal Palace. 36-1f

FERTILIZERS.—Bone Dust, Guano, Poudrette Plaster, and Super Phosphate, all warranted of the best quality.
R. L. ALLEN, 189 and 191 Water-st.

LAWTON BLACKBERRY.—Genuine Plants may be purchased of WM. LAWTON, No. 54 Wall-st., New-York. 57

Agricultural Implements.

AGRICULTURAL IMPLEMENTS.—The subscriber offers for sale the following valuable Implements:

FAN MILLS.—Of various kinds, for Rice as well as Wheat, Rye, &c.

GRAIN DRILLS.—A machine which every large grain planter should possess. They are of the best patterns, embracing several varieties and sizes, and all the most valuable improvements.

SMUT MACHINES, Pilkington's, the most approved for general use.

HAY AND COTTON PRESSES.—Bullock's Progressive Power-presses, and several other patterns, combining improvements which make them by far the best in use.

GRAIN MILLS, Corn and Cob Crushers, a very large assortment and of the best and latest improved kinds.

GRAIN MILLS, STEEL and CAST IRON Mills, at \$6 to \$25, and Burr-Stone at \$50 to \$250, for Horse or Steam Power.

TILE MACHINES.—For making Draining Tiles of all descriptions and sizes.

WATER RAMS, SUCTION, FORCE and Endless-chain Pumps; Leather, Gutta Percha, India Rubber Hose, Lead Pipe, &c.

CALIFORNIA IMPLEMENTS OF ALL kinds, made expressly for the California and Oregon markets.

DRAINING TILES OF ALL FORMS and sizes.

THRESHERS AND FANNING-MILLS combined, of three sizes and prices, requiring from two to eight horses to drive them, with corresponding horse powers. These are the latest improved patterns in the United States.

SOUTHERN PLOWS.—Nos. 10½, 11½, 12½, 14, 15, 18, 18½, 19, 19½, 20, A 1, A 2, Nos. 50, 60, and all other sizes.

PLOWS.—A large variety of patterns, among which are the most approved Sod, Stubble, Side-hill, Double-mold, Sub-soil, Lock Counter, Self-Sharpener, &c.

CARTS and WAGGONS.—With iron and wood axles, on hand or made to order, in the best and most serviceable manner.

HAY, STRAW and STALK CUTTERS of all sizes and great variety of patterns.

CORN SHELLERS.—For Hand or Horse Power.

FARMERS and MERCHANTS WILL find at my Warehouse every Implement or Machine required on a PLANTATION, FARM, or GARDEN. I would call attention to a few of many others offered for sale:

VEGETABLE CUTTERS and VEGETABLE BOILERS, for cutting and boiling food for stock.
BUSH HOOKS and SCYTHES, ROOT-PULLERS, POST-HOLE AUGERS, OX YOKES, OX, LOG and TRACE CHAINS.

Grub Hoes,	Picks,	Shovels,
Spades,	Wheelbarrows,	Grindstones,
Cultivators,	Road-Scrapers,	Grindstones,
Seed and Grain Drills,	Garden Engines,	
Sausage Cutters and Slicers,	Garden and Field Rollers,	
Mowing and Reaping Machines,	Churns, Cheese Presses,	
Blacksmith Forges, Rod Mills,	Corn and Cob Crushers,	
Weather Vanes, Lightning Rods,	Horticultural and Carpenters' Tool Chests,	
Clover Hullers,	Saw Machines,	Cotton Gins,
Shingle Machines,	Scales,	Gin Gear,
Apple Parors,	Rakes,	Wire Cloth,
Hay and Manure Forks,	Belting for Machinery, &c.	

R. L. ALLEN, 109 and 191 Water-st.

GRASS SEEDS.—Timothy, Red Top, Kentucky Blue, Orchard, Foul Meadow, Ray, Sweet-scented Vernal, Tall Fescue, Muskit or Texas, Tall Oat and Spurry.

Red and White Clover.
Lucerne.
Saintfoin.
Alyse Clover.
Sweet-scented Clover.
Crimson or Scarlet Clover.

FIELD SEEDS.—A full assortment of the best Field Seeds, pure and perfectly fresh, including Winter and Spring Wheat of all the best varieties.

Winter Rye.
Barley.
Buckwheat.
Oats, of several choice kinds.
Corn, of great variety.
Spring and Winter Fitches.

PEAS, BEETS, CARROTS, PARSNIPS, and all other useful Seeds for the farmer and planter.

GARDEN SEEDS.—A large and complete assortment of the different kinds in use at the North and South—all fresh and pure, and imported and home grown expressly for my establishment.

MISCELLANEOUS SEEDS.—Osage, Orange, Locust, Buckthorn, Tobacco, Common and Italian Millet, Broom Corn, Cotton, Flax, Canary, Hemp, Rape and Rice.

FRUIT TREES.—Choice sorts, including the Apple, Pear, Quince, Plum, Peach, Apricot, Nectarine, &c., &c.

ORNAMENTAL TREES and SHRUBBERY.—Orders received for all the native Forest Trees and for such foreign kinds as have become acclimated.
R. L. ALLEN, 109 and 191 Water-st.

POULTRY.—D. FOWLER, No. 14 Fulton Market, New-York, dealer in Live and Dressed Poultry of all kinds; for Shipping, &c. Also all the various kinds of Fancy Poultry, Pigeons, &c., for Breed.
N. B.—Persons having good Poultry to dispose of would do well to give Mr. F. a call before selling elsewhere.

Agricultural Books.

BOOKS FOR THE FARMERS.

WARRANTED TRUE TO NAME.
The soil, climate, &c., of this locality being so favorable to the Pear, our Trees are unrivaled for HEALTH, vigor of growth, &c., &c.

They are all free from that destructive malady, THE PEAR BLIGHT, which has never existed in this locality.
Prices low, and a liberal discount to the trade.
New-Bedford, 1854.

THE HORSE, THE HORSE.

NOBLEST OF DOMESTIC ANIMALS.
And the one most frequently ill-treated, neglected, and abused. We have just published a Book so valuable to every man who owns a horse, that no one should willingly be without it. It is entitled,

THE MODERN HORSE DOCTOR, and is from the pen of that celebrated English Veterinary Surgeon, Dr. GEO. H. DADD, well known for many years in this country, as one of the most successful scientific and popular writers and lecturers in this branch of the Medical and Surgical science. The Book which he now offers to the public is the result of many years' study and practical experience which few have had.

From the numerous and strong commendations, of distinguished men and the newspaper press, we select the following:
Extract from a letter from Hon. John H. Clifford, Ex-Governor of Massachusetts:

NEW-BEDFORD, May 11, 1854.
DR. DADD—Dear Sir: I hope your new work on the noblest creature that man has ever been permitted to hold in subjection—the Horse—will meet with that success which all your efforts in this direction so well deserve.

Your obedient servant,
JOHN H. CLIFFORD
From Hon. Marshall P. Wilder.

BOSTON, May 13, 1854.
DR. DADD—My Dear Sir: I am greatly obliged to you for the valuable treatise, the results of your own investigations, which you have recently issued, hoping that it may meet with the patronage of a discriminating community.

I remain yours with great regard,
MARSHALL P. WILDER.

The "Modern Horse Doctor," by Dr. G. H. Dadd, is a manual of genuine science, and ought to be owned and studied on the score of humanity, as well as interest, by every man who owns a horse.
[Boston Congregationalist.]

Dr. Dadd has had great experience in the cure of sick horses, and explains the secret of his success in this volume.
[New York Tribune.]

The author of this work is well known as a most skillful veterinary surgeon. His book is based on the soundest common sense, and as a hand-book for practical use, we know of nothing to compare with it.
[Yankee Blade.]

We know Dr. Dadd well, and are satisfied that he possesses most important qualifications for preparing such a book as this.
[New-England Farmer.]

Messrs. Jewett & Co. have just published a very valuable work by Mr. Dadd, a well-known veterinary surgeon, on the causes, nature and treatment of disease, and lameness in horses.
[Farmer's Cabinet.]

This is one of the most valuable treatises on the subject ever published; and no owner of that noblest of the animal race, the horse, should be without it. Especially should it be in the hands of every hotel and livery-stable keeper. To many a man would it be worth hundreds of dollars every year.
[Ind. Democrat, Concord.]

By far the most learned and copious work on the horse and his diseases we have ever seen.
[N. Y. Evangelist.]

One of the greatest and most commendable qualities of this work is, it is practical and plain to the comprehension of those farmers and others for whom it is mainly designed. The course of treatment favors generally a more sanative and rational system of medication than that recommended in any previously existing works on farriery. No farmer or owner of a horse should be without this book. Stable-keepers, stage-proprietors and hackmen we believe would derive profit by having at least one copy hung up in their stables for use and reference by their stable men.
[Daily News, Philadelphia.]

There is more common sense in this book than any of the kind we have ever seen, and farmers and owners of horses would find it a matter of economy to possess themselves of it. It will be of more service than the counsel of a score of ordinary doctors.
[Albany Courier.]

We deem this decidedly the best and most reliable work on the Cause, Nature, and treatment of Diseases and Lameness in Horses, ever published.
[Nantucket Inquirer.]

What we have read of this book induces us to regard it as a very sensible and valuable work; and we learn that those men more competent to judge of its value, have given it their unqualified approval.
[Eve. Traveller, Boston.]

This book supplies a great desideratum which Skinner's admirable treatise on the horse did not fill. Every man may be his own veterinary surgeon, and with much greater safety to this noble animal, than by trusting him to the treatment of the empirical itinerants who infest the country. It is well illustrated, and should be purchased by every man who owns a horse.
[Eve. Mirror, New-York.]

This is a book that should be forthwith put into the hands of all who own or drive horses, whether for the dray or gig, for the plow, omnibus or road, for hard service or pleasure.
[McMakin's Courier, Phila.]

A good, clearly-written book, which should be in the hands of every man who has a horse whose ill his affection or his purse make it worth while to cure.
[Bangor Mercury.]

It is a valuable book to those who have the care of horses.
[Hartford Herald.]

This is a scientific, thorough and complete treatise upon the diseases to which one of the noblest of animals is subject, and the remedies which they severally require.
[Troy Budget.]

He is not worthy to have a horse in his care who will not use such a work to qualify himself for his duty to the animal.
[Commonwealth, Boston.]

Published by JOHN P. JEWETT & CO. Boston.
JEWETT, PROCTOR & WORTHINGTON, Cleveland, Ohio.

For sale by all Booksellers.

HORSE POWERS THRESHERS AND SEPARATORS.

—The Endless Chain or Railway Powers of our own Manufacture, both single and double-gear, for one and two horses, which has never been equalled for lightness in running, strength, durability, and economy. They are universally approved wherever they have been tried.

Special Notices to Subscribers, Correspondents, &c.

SUBSCRIPTIONS can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September, as a half yearly volume of 416 pages, with a complete index, begins on each of those dates.

Those wishing their papers changed from one office to another, should give the name, County, and State, of their old and new Post-office.

When money is paid at the office, a receipt can easily be given, but when Subscribers remit by mail this is less convenient, and they may consider the arrival of the paper as an acknowledgment of the receipt of their funds, unless otherwise informed by letter. Any person particularly desiring a written receipt can state the fact when remitting funds, and it will be sent in the first number of the paper forwarded after the money is received.

Postage is no higher paid at the office of delivery than if paid at the office where mailed, and as the "regulations" at the New York Post-office preclude us from paying by the quarter or year, it is useless for subscribers to send money for the pre-payment of postage, for we can not attend to paying postage fifty-two times a year for each subscriber.

Clubs may add to their number at the same rate per copy as was paid by the original members.

The paper is stopped when the time for which it is paid expires. A notice or bill is usually sent in the last number.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then inclose them in presence of the Postmaster. Give the Post-office, and the County and State. Write these very plainly.

Economical Arrangement to Furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The <i>American Agriculturist</i> will be furnished with Harper's Magazine, one year for - -	\$4 00
" Putnam's " " " " " " " " " " " "	4 00

" Dickens's Household Words " " " " " " " " " " " "	3 50
Address	ALLEN & CO.,
	199 Water-st., New-York.

PUBLISHERS' ANNOUNCEMENT!

THIRTEENTH VOLUME OF

THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

The American Agriculturist,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

N. B.—The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume, for the bound work.

COMPREHENSIVE IN ITS CHARACTER.

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the Agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "Farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent Farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor, by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of Agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers *only* that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon *its own merits*; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammeled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great Agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the joint Editorial supervision of Mr. A. B. ALLEN—its principal editor for the first ten years—and Mr. ORANGE JUDN, A. M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical Agriculture, and, in addition to these, a number of other eminent Agricultural and Horticultural writers.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and Post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers.....	\$2 00	A YEAR, \$2 00
" Clubs of 3 do.....	1 67	" 5 00
" " 5 do.....	1 60	" 8 00
" " 10 do.....	1 50	" 15 00
" " 20 do.....	1 25	" 25 00

The money always to accompany the names for which the paper is ordered.

The Postmaster, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Postmaster, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, Weekly Tribune, or Weekly Times, or any other paper or periodical in this City, the cost not exceeding two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if inclosed and mailed in the presence of the Postmaster.

Communications for the paper should be addressed to the Editors; Subscriptions, Advertisements, and all matters relating to the business department, should be addressed to the Publishers,

ALLEN & CO., No. 199 Water-st., New-York.

AMERICAN AGRICULTURIST.

SEE LAST PAGE.

MR. J. J. MAPES AND HIS SUPERPHOSPHATE.

A week or two since we received a sheet of two printed pages headed, "From the Working Farmer for November," the burden of which appears to be an effort to excite sympathy in behalf of "Mapes's Improved Superphosphate of Lime," because the *American Agriculturist* recently published some experiments made by one of its Editors, in which that manure did not appear to the best advantage.

We should not deem this worthy of notice, did it not contain some hints at a want of integrity on the part of the Editors of this journal, because, perchance, one of the publishers happens to sell Peruvian guano, and Deburg's superphosphate of lime, as well as Mapes's, or that of any other manufacturer, which may be called for by his customers.

We will state, once for all, that the Editors of this paper embrace a number of gentlemen who are, both from principle and by special written contract, entirely disconnected from any interest in the private business of either of the publishers. This paper is edited solely with reference to developing the true principles of scientific and practical agriculture, no matter whose private interests it may advance or ignore.

Guided by these motives, we have studiously avoided any allusion to the private nostrums, or special fertilizers, either of Mr. Mapes or any other individual manufacturer. We have received numbers of letters condemning this and that particular manure, but we have given them no more attention than we should had they treated of Brandreth's pills, or the thousand and one sarsaparilla life-preservers or life-restorers. When speaking of superphosphate, we have considered it *only as* superphosphate, and not as Mapes's, or Deburg's, or Coe's, or Patterson's. During the "superphosphate war," we have frequently been called upon to give our views upon the subject; but our answer has been, that whatever is said, serves only as grounds for awakening sympathy in behalf of the would-be-persecuted, on the part of those who have the facilities of hearing only *one side* of the subject.

Our recent article perhaps demands a word of explanation. Last Spring Rev. William Clift, one of the Editors of the *American Agriculturist*, residing at Stonington, Conn., proposed, through the Norwich Examiner, (the Agricultural Department of which is

under his supervision,) to the different manufacturers of special fertilizers, to send him average samples of their manures, and he would give them "fair trial, side by side, and publish the results." We made no inquiries of his progress, and heard nothing from him on the subject, till a short time since, when he sent in, among other articles, one entitled "An Experiment on Grass with Concentrated Fertilizers."* As Mr. Clift is well known as a careful investigator, and an unbiassed experimenter, the article was published without revision; and we still deem the results valuable—as much so as one set of experiments could make them, and this was all that was claimed. Had the article been carefully examined by the conducting editors, probably all allusion to individual manufacturers would have been dropped, according to our usual custom *heretofore*. Hereafter, we do not promise to spare any individual nostrums.

With Mr. Mapes, personally, we have no controversy. He has done much to set farmers to thinking upon their profession; and possessing, as he unquestionably does, plausible native talent, he has engrossed no small share of public attention. We could have wished that he had been less a novice in practical agriculture; that his scientific knowledge had been less superficial; that he had looked deeper into, and taken more time to study, the true causes of agricultural phenomena, instead of too hastily publishing conclusions, founded on theoretical premises only. Had he done this, his opinions would have had more present weight with cautious scientific men, and ultimately with the community at large. There would, even now, be fewer persons to distrust all the aids of science, because their first hopes have been blasted. His own reputation would have been more lasting, and in the end more brilliant; and others would have found less to contend with. Mr. Mapes has been quite too careless in stating his own results to the public. One error or misstatement, discovered, casts a shade of doubt over all others he may make.

We also think it unfortunate for his reputation, that he has so publicly identified himself with a manure, in which he is privately interested. His superphosphate, however well it may have succeeded in some instances, has signally failed to give expected

* Since writing the above we learn from Mr. Clift that the superphosphate used was obtained from a quantity procured direct from the manufacturer, and for sale in the New-York market, and that he deems it a fair average of what is usually sold.

results in many others, and he must, individually, endure the odium, for he has suffered his reputation to be identified with that of his fertilizer.

We harbor no unkind feelings toward Mr. Mapes as a man, for we have no cause for so doing; but he has made himself, his teachings, and his manures, public property, and as such we must express our honest convictions of them. Had he allowed it, we should probably have kept silent, though as conservators of the public interest it is perhaps demanded of us that we raise our voice against whatever is leading into error—and such we consider the tendency of his teachings, taken as a whole.

We have no desire to enter the lists as combatants with Mr. Mapes. He will doubtless court this. One of the shrewdest advertisers in the country said to us, the other day, 'he did not care what people said of him, only so that they talked. He could make as much money out of their animadversions as out of their praises. The sympathy of the public, for the time being, always goes with the apparently persecuted, however wrong they may be.'

THE OREGON PEA.

We received a small sample of this pea, last Spring, from a friend in Mississippi, where it flourishes well, and yields on poor land a very large amount of fodder. The gentleman who sent us the seed esteems it very highly, both for food and as a renovator of the soil. We planted our seed on good soil, with a southern exposure. The seed came up well, and grew luxuriantly early in the season. They continued green through the drouth, but gave no signs of fruit or flower. We see, from the following article in the Rural New-Yorker, that other cultivators have had similar success. It is manifest, that this pea is not adapted to our climate. It will be a long while, we think, before Indian corn will find it a rival as an article of fodder.

Glowing accounts have been published of this new plant, and considerable inquiry elicited for further information. For a southern latitude, it may be all that is claimed for it. But hereabouts, those who undertake its cultivation, we opine will be much disappointed.

The writer received samples of this pea from three or four different sources the past winter, a portion of which he planted out the 6th of May, alongside the Japan pea and a Stock pea from Mississippi, on soil but mod-

erately rich. The plants came up well and made a tolerably fair growth, but not equal to either of the other kinds. Not a vestige of a flower had made its appearance on the 21st of September, when we had a frost that killed the plants, while the Stock pea had ripened a few pods, and the Japan had so far matured a portion of its fruit as to leave no doubt of its vegetative power. In fact the Japan was but little affected by the frost which completely killed the foliage of the Oregon pea. Like the Japan, the stalks and branches of the Oregon are half woody, but not of so vigorous a growth. Neither were they, apparently, affected by the drouth, but presented a green and healthy habit. The plants of both varieties have more the look of giant bush beans than of peas—the Japan having much the largest leaves, which with the stems, pods, &c., are hirsute. It may be the Oregon is an excellent renovator of the soil, but where one will have to depend on seed from a distance, it seems our northern farmers can find other plants more reliable, better tasted, and far cheaper. T. E. W.

WEEDS—COUCH GRASS.

On reading a book on the "Weeds of Agriculture," in 1830, I have made this memorandum. Although the true secret of destroying weeds has been known and partially practised for ages, yet we frequently have questions asked what is the best and surest way of getting rid of this or that weed which, by long neglect or improper husbandry, has got full and uncontested possession of the soil. The Couch or Twitch grasses are plants of the *Agrostis* family; they are the most destructive of all root weeds. If any part of them is left in the ground they grow most vigorously, and appropriate to themselves everything that is within their reach, devouring the food applied by the farmer to the ground as food for the plants he cultivates, and if they are not restrained by his utmost vigilance and the most unremitting exertions, they soon become the supreme occupiers of the soil. The White Couch (the quickens of Scotland) pushes out its strong white roots under the surface in every direction in the deep soft black land of Norfolk, Cambridge, and Lincolnshire. In this pretty soil it riots in many instances in uncontrolled possession of the whole field, particularly where the land is over-plowed; here the White Couch sends forth its strong, creeping roots, where it meets with little or no obstruction. It increases with astonishing rapidity, and also defies the vigilance and industry of the best farmer to master it. In the soft, light, sandy soil of Norfolk, near Holkham, I once saw a rick of the roots of this White Couch grass, which had during the dry, warm months of May and June been taken out of a light sandy field of about 4 acres, and dried and stacked at a public house for litter; there were from 12 to 15 tons of it. The inn-keepers said that it made excellent litter, and the horses liked it, for they eat some of it. The Black Twitch, Surface Twitch, or Black grass, is the *Agrostis stolonifera*; this is a most destructive weed, it abounds on the light stone-brashy soil of the oolitic formation, particularly on the Cotswold Hills, where the soil has been reduced by over-cropping. The farmer must be on his guard, for this Twitch is not only propagated by its seed and roots, but as its stems are long and trailing, every joint or stolon sends out roots like the Strawberry, and it soon becomes a most numerous family of destructive weeds, spreading themselves far and wide over the field, covering the whole surface with its thick mantle, so that it is difficult for any plant to live where this weed abounds. If the smallest and most insignificant part of this plant is allowed to

remain in the most remote corner of the field, it will soon by its rapid growth extend itself into the possession of the whole field again; and it is most difficult to plow the land when it is covered with this black grass, nor can it be done properly till it has been breast-plowed. We can not get rid of these weeds in any other way than by taking them out root and branch, drying them and burning them; and this is done in the Cotswold Hills by what they call "smother-burning," and thus converting the ashes of an enemy into a valuable manure for their wheat or turnips. But "prevention is better than cure;" and therefore, high farming, as it is called, will best prevent the growth of these or any other weeds. First clear the land of all weeds, and always keep it clean; apply large quantities of manure, which, with good cultivation, will produce large crops of roots; and by consuming these on the ground, and adopting the alternate system of cropping, there will be no difficulty in keeping the land free from the white or black Twitch or any other weed. About the year 1805 the value of the *Agrostis stolonifera*, as a rich and most productive and nutritious food for stock of all kinds, as green food during the whole of the winter months, was sounded forth by a Doctor Richardson, and it got the name of *Agrostis stolonifera* Richardsoni; and as it was very easily propagated, the doctor sent it into Ireland as the most valuable of all the grasses, all that was required being to mow the crop at any time of the year, then carry it from the field, and cut it in lengths of about 2 inches long with a chaff-cutter, then sow the cut grass over the field (which has been previously plowed), and then harrow and roll it, when each of the joints or stolons took root, and a large crop sown covered the ground of what the doctor called "the most nutritious food for the stock." Agricultural Gazette.

ON THE MANAGEMENT OF YOUNG RABBITS.

The little rabbits are born blind and helpless, covered only with a short velvety down. On the fifth day they open their eyes; on the sixth, the liveliest fellows among them begin to peep outside the nest. At a month old they eat alone, and partake of food together with their mother. At six weeks old they no longer require the doe, and ought to be weaned. After weaning, two modes of feeding have been adopted with equal success; the first is, to introduce all the weanlings, from time to time, into a large hutch or common apartment, in which they are tended carefully, kept warm and clean, and fed several times in the course of the day. At each feeding time, every particle of victuals which has been trampled upon, is scrupulously withdrawn; and it is found that, by observing these regulations, the losses are very few or none. When two months and a half old, they are placed with those that are destined for the table. They will fatten on carrots, oats, hay and bran, with a few peas now and then.

The second plan is to keep together all the young rabbits of the same month; that is to say, they are distributed in six large hutches or apartments, care being taken to separate the males from the females by the end of the third month. From the fifth to the sixth month, all those intended for sale are disposed of, after selecting the handsomest and best tempered does to serve as breeders. Does continue prolific until they are five years old. Beyond that age it is rare to meet with rabbits surviving in a domestic state. The duration of their natural life is said to be from six to eight years, Buffon extends the term to nine.

Rabbits are sometimes injured by being

handled clumsily. The proper way to take hold of them is, to grasp the ears with the right hand, and to support the rump with the left. To seize them by the leg is apt to dislocate a limb, especially in the case of a creature that is shy; an injudicious gripe round the neck or the body may prove unexpectedly and suddenly fatal, by injury to the vertebræ, compression of the lungs or breaking of the ribs; a hasty clutch at the tail may cause the fur of that ornamental member to come off in one piece, and spoil the animal's beauty for life. The instantaneous way in which an adroit hand will kill a rabbit, apparently by the merest touch, gives a forcible hint of the caution we should use in allowing a favorite animal to be captured and pulled about by inexperienced persons.

Rabbits should be fed twice a day; at morning and night. If they are on green food, it ought to be thoroughly dried before it is given to them. This diet (green food) should principally consist of the refuse of garden vegetables, giving only a moderate quantity of cabbage, lettuce, or other cold, watery plants. *Wet herbage is deadly poison* to rabbits. The leaves and roots of carrots, all sorts of leguminous plants, the leaves and branches, or the prunings of trees, wild succory, parsley, pimpernel, &c., may be the diet of rabbits during the summer. The great point of all seasons is to have the dry preponderate over the moist. We even believe that, where the more costly kinds of dry food, as hay and corn, are not attainable, sawdust and withered leaves might be given to keep rabbits in health. A variety of food is a good thing; and surely the fields and hedges furnish this variety—all sorts of grasses, strawberry leaves, and ivy. They should have oats once a day. When the doe has young, feed her abundantly with all sorts of greens and herbage, and with carrots and the other things mentioned before, and do not think because she is a small animal that a little feeding or a little care is sufficient. [Poultry Chronicle.]

CHOLERA PANACEA.—The first physician of the poor dead King of Saxony has published a preventive of the cholera, which may be useful to our "go-ahead" countrymen. It lacks Latin, and so may be unintelligible to our Hippocrates, but its plain English can not harm "the people." Here it is:

Of warmth.....	20 parts.
Of cleanliness.....	5 parts.
Of morality.....	22 parts.
Of activity.....	1 part.
Of good sleep.....	2 parts.
Of pure air.....	10 parts.
Of tranquillity of mind.....	40 parts.

These 100 parts united form the great cholera panacea. [Boston Trans.]

Periods of Gestation of Animals.

Mare.....	11 months.	Bitch.....	2 months.
Jenny.....	11 "	Cat.....	8 weeks.
Cow.....	9 "	Rabbit.....	4½ "
Goat.....	4½ "	Rat.....	5½ "
Ewe.....	5 "	Mouse.....	4½ "
Sow.....	4 "	G'nea Pig.....	3 "

The period of incubation of domestic fowls is as follows:

Swan.....	6 weeks.	Pea Hen.....	4 weeks.
Turkey.....	4 "	G'nea hen.....	3 "
Goose.....	4 "	Hen.....	3 "
Duck.....	4 "	Pigeon.....	2 "

PRESERVE carefully the droppings from your hen-roosts, and by the mixture of a little plaster of Paris as you put them away in a dry place, you will have a manure very little inferior to the best Peruvian guano, and at one-tenth the cost.

POINTS OF AN AYRSHIRE COW.

Would you know how to judge a good Ayrshire cow, Attend to the lesson you'll hear from me now:
 Her head should be short, and her muzzle good size;
 Her nose should be fine between muzzle and eyes;
 Her eyes full and lively; forehead ample and wide;
 Horns wide, looking up, and curved inwards beside;
 Her neck should be a fine, tapering wedge,
 And free from loose skin on the undermost edge;
 Should be fine where 't is joined with the seat of the brain;
 Long and straight overhead, without hollow or mane;
 Shoulder-blades should be thin where they meet at the top;
 Let her brisket be light, nor resemble a crop;
 Her fore-part recede like the lash of a whip,
 And strongly resemble the bow of a ship;
 Her back short and straight, with the spine well defined,
 Especially where the back, neck, and shoulders are joined;
 Her ribs short and arched, like the ribs of a barge;
 Body deep at the flanks; and milk-veins full and large;
 Pelvis long, broad, and straight, and, in some measure, flat;
 Hook-bones wide apart, and not bearing much fat;
 Her thighs deep and broad, neither rounded nor flat;
 Her tail long and fine, and joined square with her back;
 Milk-vessels capacious, and forward extending;
 The hinder part broad, and to body fast pending;
 The sole of her udder should form a plane,
 And all the four teats equal thickness attain,
 Their length not exceeding two inches or three;
 They should hang to the earth perpendicularly;
 Their distance apart, when they're viewed from behind,
 Will include about half of the udder you'll find;
 And, when viewed from the side, they will have at each end
 As much of the udder as 'tween them is penned;
 Her legs should be short, and the bones fine and clean,
 The points of the latter being firm and keen;
 Skin soft and elastic as a cushion of air,
 And covered all o'er with short, close, woolly hair;
 The colors preferred are confined to a few—
 Either brown and white chequered, or all brown, will do;
 The weight of the animal, leaving the stall,
 Should be about five hundred weight, sinking offal.
 [Farmer's Gazette.]

WESTERN CATTLE—PROSPECTS AND PRICES.

In our reports of the cattle market here, we have frequently remarked upon the number of beef cattle and swine, forced upon the market before their time; and in the case of the bullcows, although the quotations by the pound indicated fair prices, the sums realized per head were often less than the cost of the animals last June; leaving the interest, pasturage, transportation, commission, attendance, risk, &c., all a total loss. This must be the case, in a great degree, upon all the droves sold in our market, composed of three and four year old steers, at \$40 to \$45 a head.

The loss upon swine, at 4c. and 4½c. a pound, is quite as bad. The cause of this comes in a great degree from the drouth, and consequent failure of pasturage and cutting short of corn crops, so that owners were unable to fatten, and feared to risk buying feed at the advanced rates or holding over until another season. For the same reason a great many cows and immature two and three year old steers and heifers have been sent to the shambles. This must affect the supply next season, so that the prospect of cheap meat is not at all flattering. Independent of this, there is a very large local western demand, occasioned by the vast immigration constantly flowing that way. The Minnesota Democrat, St. Paul, October 25th, says:

"Cattle, both for beef and work purposes, are coming in rapidly, but the demand is greater than the supply. As an instance of what has been done, we may mention that our townsman, Charles Coulter, has since the opening of the season, brought up for the supply of this market, from Iowa, Illinois, and Wisconsin, upward of 1,000 head of beef cattle. There are a number of other persons engaged in the business, and they have been kept busily engaged all the time. The ruling price in the market is 8 cents, nett, for good cattle on the hoof.

"Work cattle are scarce and very high.

Those brought here, and they have come in great numbers, have changed hands rapidly, and scattered over the Territory, are aiding our farmers to till the generous soil. Every steamboat that arrives brings a number of them and they are driven here by land in droves."

The demand for Kansas settlers is also proportionably great; and every spring the number that is driven over the plains is almost beyond belief.

What, then, is our prospect for the winter or the next season? It is a subject of deep interest to farmers and all who feed cattle, and they should study it well, and thereon base their calculations.

The Cincinnati Price Current of November 1, says that prime beef cattle are scarce at \$6 50 a \$7 per cwt., nett, and are held firm at that price. Nothing but a short supply in the country, or short crops of beef-producing food, could induce such prices.

The same paper says that hogs sold the past week at \$3 75 a \$3 80 nett, but that was partly owing to warm weather. Of those cut up, the sides were rendered into lard, and the shoulders and hams sold at 3½ a 5½c.

The Examiner, Lexington, Mo., says that \$3 50 a \$4 for pork is all that can be calculated upon in that country, though farmers generally anticipate high prices on account of the great deficiency in the corn crop in that State. These prices of pork and beef do not correspond, and show very plainly to us that scarcity of beef cattle has more to do with the price than scarcity of feed. On the other hand there is an ample supply of hogs—too great for the corn crop of the West, and hence their low prices, here and there.

We have come to the conclusion that there is an alarming deficiency of horned cattle in the United States, and that this is the cause of high prices of beef—higher, as a universal thing, than ever known in any former year; and unless some plan can be devised to stay the wastefully wicked destruction of calves and young cattle, we may never see the day again of cheap roast beef.

One of the most feasible plans, perhaps, that could be devised, would be a law to prevent the killing of calves. Not exactly to prevent the owners from killing—for any man may destroy such property belonging to him—but a law to forbid the sale of veal calves under six weeks' old.

What if all the money now annually appropriated to agricultural societies should be given, pro rata, to the counties rearing the largest number of calves, or else divide it per capita, upon all that may be raised to the age of two years? It would do more good to the State in two years than has been done by all the money wasted upon State and County shows.

We are now killing off the calves, generally at less than a week old, and importing from the Western States all of our own beef cattle, working oxen and cows. The consequence is, we have exhausted the supply. The Western farmers, tempted by the enormous prices that have been offered them, since the railroads have been completed so as to bring cattle cheaply and rapidly into market, have sold off their unripe crop of beeves, and now they can not fill our orders, at such prices as beef could, would, and should be produced in this country, if a rational course was pursued. Our present policy is as foolish as killing the goose that lays the golden egg.

Shall we allow it to become a historical fact, that America can not produce beef enough for her own use, when we shall be able to sell at a fair profit to the farmer, and still undersell every other northern section of the world; for we certainly have the means of making, not only the most, but the best beef cattle at the least cost, of any other

country; and yet we are consuming the meanest quality of cattle ever eaten by any civilized people!

A great good would be done, if our City government would prohibit the sale of all cattle, that would not pass inspection, and positively forbid any person to bring two days' old calves, or their meat within the City limits.

The prospect of any material reduction in the price of beef, for the next year, need not be indulged in; and unless something can be done to put a stop to the universal destruction of the raw material out of which beef is made, the prospect for future years is indeed a gloomy one. [Tribune.]

EXPERIMENT IN GUANO.

MR. EDITOR: An experiment, which I have just completed with guano in a small way, on peas, has resulted so favorably that I feel disposed to send the details for publication.

On a spot of sandy loam, having a rapid descent, and a southern exposure, I planted one quart of large marrowfat peas, on the 20th of March. The ground was in grass the preceding year, and was broken up in the autumn, previous to planting. In the spring I gave it a good harrowing, and sowed the peas in double drills. The quantity of guano was, as nearly as I could calculate, at the rate of one barrel per acre. It was deposited in the drills, by hand, before sowing the seed, and covered the same day, almost the same hour, it was dropped. The piece thus manured, consisted of six double rows. Immediately in contact with these rows—the soil of the entire piece being precisely of the same construction and character—I planted six others, which were manured liberally with old compost, and another six rows on the other side, manured with poudrette. The whole eighteen rows were treated precisely alike, in every respect, from the commencement; all being planted on the same day, and hoed, stuck and harvested on the same days. From the time the peas made their appearance—and they all emerged from the soil simultaneously, or nearly so, those manured with guano took the lead, and this superiority they maintained till the period of maturity arrived. The vines were not only much more vigorous in their development, but of a darker and more luxuriant green. When the fruit set, there was nearly double the number of pods on the six middle rows that there were on the others, and at harvest the excess of yield was found to be in nearly the same ratio. The six rows, dressed with the stable manure, out-stripped the six dressed with poudrette, in the relative degree of five to four, and produced a fairer and plumper grain, but less stalk, by weight. The season was for the most part dry, with only occasional showers, and those not sufficiently copious to wet down to the roots. There was but one storm of any duration from the period of planting, till harvest, and that occurred at the time the crop was in blossom. You are at liberty to do as you please with this—publish, or not.

Germantown Telegraph.

CATTLE MARKET.—The largest market ever known was held at Smithfield, on Monday. From the returns furnished, it appears that the beasts were 5,688 in number, and the sheep 46,950. The supply, even at the "Grand Christmas Show," has never been so large. Beside these, there was a large number of calves and pigs. At a very moderate calculation, the value of the animals offered for sale would amount to a quarter of a million sterling. [English Paper.]

NEVER listen to loose or idle conversation.

VALUE OF CARROTS FOR MILK COWS.

MESSRS. EDS: I have tried feeding carrots to milk cows, and will give you one of my experiments. I have, (April 15th,) seven cows in milk—one calved in June, the rest in September and October. I raised eighty bushels rutabagas and four hundred bushels carrots, and fed them to my cows, commencing the first of December. I gave them about 2½ bushels per day, at noon, the rutabagas first, and when they were all fed out, the same quantity of carrots. I found, when I had fed the latter a few days, that my cows were each giving from two to three pints of milk more per day, than when fed on rutabagas. I was feeding my cows, meanwhile, with cut hay, and 2 lbs. oil cake and meal, and 2½ lbs. wheat screenings, ground.

The thought struck me that I should like to know the value of carrots for making milk, so I selected the cow that calved last, for the trial. I weighed the hay, meal, and carrots, and fed perhaps 27 lbs. of hay, 4½ lbs. of mixed meal, and 22 lbs. of carrots, and she gave 35 lbs. of milk per day. I then left off the carrots and gave the same amount of meal, and all the hay she would eat, which was 33 lbs. per day. After feeding so for a week, I found she gave 23 lbs. of milk per day. I then gave her the carrots as before, and in eight or ten days she came up again to 35 lbs. of milk per day.

This shows that carrots are worth to me to feed cows, 82 cents per 100 lbs. Hay is worth \$20 per ton in the barn, and at 3 cents per quart, or one cent per pound for milk; 6 lbs. less hay, and 12 lbs. more milk gives 18 cents for 22 lbs. of carrots. My carrots are all gone now, or I would try one or two more cows. Next winter I hope to have another opportunity for experiment.

SOUTH FRAMINGHAM, Mass. ABNER HAVEN.
Rural New-Yorker

MEADOW MUCK.

We trust that many of our readers and correspondents will haul muck that has become dry and pulverized, into their barn cellars or under cover during the fall months. If not convenient to get to barn or barn-yard, haul it on fields on which you intend to raise corn or potatoes, and put in heaps shaped so as to prevent soaking and leaching, as muck generally contains some lime and other soluble matter. If this should be attended to pretty generally by our readers and correspondents, we might expect to hear many favorable reports of the practice in the course of the ensuing season. That which is hauled to the barn or near it, should be used to mix up a fresh layer every week or so, with the contents of the privy, and to absorb the suds and discharges from the sink-spout in a vault dug near it. Some may also be used to mix with the droppings of the animals, and whenever a compost of any kind is made, muck should enter into its composition.

In any and all these ways excellent manure will be formed, which will speak for itself on the garden, corn-field or elsewhere. Muck by itself, a shovelfull in a hill, is a good application for potatoes. We hope muck will be used in all the ways named, and that we shall hear of it. [Credit Lost.]

ENGLISH FARMS AND FARMERS.—Farms occupy two-thirds of the land of England. The number of the farms is 225,318; the average size is 111 acres. Two-thirds of the farms are under that size, but there are 771 of above 1,000 acres. The large holdings abound in the south-eastern and eastern counties; the small farms in the north. There are 2,000 English farmers holding nearly 2,000,000 acres; and there are 97,-

000 others who altogether do not hold more. There are 40,650 farmers who employ five laborers each; 16,501 have ten or more, and employ together 311,707 laborers; 170 farmers have about sixty laborers each, and together employ 17,000.

A LETTER FROM A HORSE.

As I am nothing but a poor quadruped, a mere omnibus horse, I suppose you will hardly care to publish this letter; but I hope you will do it for the sake of humanity, if not for mine. When I lived in the country, where I was raised, I was accounted a good lively beast, and the country youngsters would spend all Sunday afternoons around me, rubbing me down, admiring my fine proportions, and practicing me on the road. About four years ago, my owner getting rather hard up for money, to pay some bets he had lost on that famous mare Nancy Dawson, concluded I would bring a good price here in New-York; so he put his son Peter Adolphus on my back, and sent me down to that noted city horse-jockey Billy Button. I had often heard my master speak of Mr. Button as being a highly honorable gentleman, and as he had occasionally been in our part of the country on business in this particular line, I remembered that he used to wear a white cravat, a green cloth coat with brass buttons, and a bell-crowned hat with the brim a good deal turned up at the sides. I fully expected that, when I got among the *scrawny* city nags, the comparison would be all in my favor, and Mr. Button would crack my value up to a pretty high standard; but I was never more mistaken in my life. Mr. Button, after looking at me a while, shook his head very dubiously, and told Peter Adolphus that I was hardly the horse for this market, and in fact he thought he didn't care to buy me at any price. He made out that I had three or four horse distempers (that I had never even heard the names of before), and said I looked old enough for a horse ten years of age; though, as true as I am now a jaded old hack, my age then was only five years and a week. Peter Adolphus was taken all aback, and looked as though he thought Mr. Button would be doing him a great favor by taking me off his hands as a gift; but my dander was up a little at being snubbed down in this manner, so when Mr. Button's hand was fumbling about my mouth, I gave him a bite that I reckon he remembered for some time after. "Oh, well, Peter Adolphus," says Button at last, "I suppose you don't care about taking, the old fellow home with you again, so I guess I'll give you seventy-five dollars for him, but if it wasn't that your old dad is a particular friend of mine, I wouldn't give him stable room."

So, Peter Adolphus gave me a long, lingering look as farewell, pocketed his seventy-five dollars, and packed off home in a rail car. I now found that Mr. Button began to see all at once that I was a very valuable horse. He had Mr. Foodle and Mr. Racket to come and look at me. Well, they smoothed me down, and looked in my mouth, praised my head, admired my legs and talked of my fine points; so that I began to think that I was *some* horse after all, and pricked up my ears like an animal of spirit. Racket said I was well worth two hundred and twenty-five dollars, and Foodle offered two hundred for me on the spot: but Mr. Button shook his head (in a very different manner, though, from what he did when Peter Adolphus was on my back) and said that the best man's money in town wouldn't buy that critter unless it counted up to two hundred and fifty dollars. There was quite a run after me; a fresh arrival of a nag of character will draw the horse folks in shoals, and if I had been a prince of the Cammibal Islands I couldn't have been examined with greater interest. At

length Button got wind that Dr. Epsom wanted a good horse, so Dr. Epsom was brought to the stable; he was a thin, tall man, and had practice enough, as I afterward found to my sorrow, to kill or cure all the sick folks in town. When Button showed me off, I could see the doctor's eye glisten. He said "he wanted a horse that could stand it day and night," and Button told him "if he should have a horse made to order he couldn't hit the mark better than to buy me," and after a little parley I was sold for two hundred and fifty dollars, when a black boy mounted me and rode me to the doctor's stable. Here my troubles began; I had no companion to share my labors or spell me off, and, as the doctor said, I had to be on the strain day and night.

How many dismal, dreary hours, in the cold, dark nights of winter, I have spent standing before the doors of my owner's patients, it is not in *horse arithmetic* to compute. As you may suppose, in a year or two, my constitution began, to break, and I found some of those distempers that Button told Peter Adolphus about, creeping over me in earnest. I lost my flesh and got spiritised to such a degree that Dr. Epsom concluded he wanted a more sprightly nag, so he sold me to the omnibus proprietors to whom I now belong. Ah! what a tale I could here disclose of anguish and horse suffering. It would draw tears, I am sure, from anything but an omnibus driver. How I was whipped, and raced, and over-driven and over-laden, and jerked on my haunches every minute or two to take in passengers, no tongue but the tongue of an omnibus horse can tell. I sighed for my old place at Epsom's, which, hard as it was, seemed in comparison, a horse paradise. I longed for death, and as my eye occasionally caught a glimpse of the glassy surface of the river, I sighed for a chance to jump in and drown myself. I thought that the highest point of endurance in horse agony had been reached, but I was yet to find a deeper depth in the refined cruelty of beings who call themselves human. Some demon, who takes special delight in inflicting curses on horse flesh, put it into the heads of my owners to reduce their omnibus fare to *three cents*. Now, from being beaten as it were, with ox goads to make us go, my companions and I are threshed with scorpions. The greatly increased number of passengers at the ridiculously low fare, and the long spell of intensely hot weather, (ended a few days since,) have kept us for the last two months in a state of living death.

Four of my poor brethren; who one after another groaned and panted with me in our toilsome lagging, have dropped dead at my side. I have not many days more to live myself, and some few mornings hence, should you pass through the Bowery, you will see my poor racked and beaten carcass lying in the gutter, with my visible ribs and ghastly countenance objects of derision to the passers-by. Oh, I weep as I write this, for horses have sensibilities as well as men; more keen, I should hope than *some men* have. You probably remember that there is quite a rise of ground in Chatham-square. Do try and be here some afternoon, between six and seven o'clock, when the pressure of travel is up town, and you will see us, with almost bursting veins and perpetual lashing, we are straining up hill with an omnibus containing outside and in from thirty to thirty-six passengers. I have no doubt that the ghosts of my deceased brothers are flitting about this scene of their late torture, this place of inquisition for the blood of the wretched victims of my race. At the stables where I spend a brief portion of my miserable life, I am accustomed to hear the stable boys very freely consign each other to a certain place, the name of which I shall

not even mention, for the reason that *gentlemen* who will visit our establishment I notice never speak of it. I understand that the climate of this place is excessively hot, and that it is intended as an abode of punishment for wicked bipeds, especially those who abuse poor horses and other animals. Well, you know, Messrs. Editors, that we horses have but little idea of theology, so you will not think me a very immoral animal when I acknowledge that sometimes, when I have been dragging my wearisome load up the horrid ascent of Chatham-square, I have not only felt that my owners, the driver, and all the passengers who were so cruelly overburdening me, were fast hastening to the warm region to which I have alluded; but, in my heart's agony, I have even wished they were there now.

With great respect, I remain your exhausted and broken down
BARBAROSSA.

AN ECCENTRIC MRS. BIDDY.

Nothing seems so aimless and simple as a hen. She usually goes about in a vague and straggling manner, articulating to herself cacophonous remarks upon various topics. The greatest event in a hen's life is compound, being made up of an egg and a cackle. Then only she shows enthusiasm, when she descends from the nest of duty, and proclaims her achievement. If you chase her, she runs caekling; if you pelt her with stones, she streams through the air caekling all abroad till the impulse has run out, when she subsides quietly into a silly, gadding hen. Now and then, an eccentric hen may be found, stepping quite beyond the limits of hen-propriety. One such has persisted in laying her daily egg in the house. She would steal noiselessly in at the open door, walk up stairs, and leave a plump egg upon the children's bed. The next day she would honor the sofa. On one occasion she selected my writing-table, and scratching my papers about, left her card, that I might not blame the children or servants for scattering my manuscripts. Her determination was amusing. One Sabbath morning, we drove her out of the second-story window, then again from the front hall. In a few moments she was heard behind the house, and on looking out the window, she was just disappearing into the bed-room window on the ground-floor! Word was given, but before any one could reach the place, she had bolted out of the window with victorious cackle, and her white, warm egg lay upon the lounge. I proposed to open the pantry-window, set the egg-dish within her reach, and let her put them up herself, but those in authority would not permit such a deviation from propriety. Such a breed of hens could never be popular with the boys. It would spoil that glorious sport of hunting hen's nest. [Independent.

A MAGNIFICENT FARM AND FARMER.—A Vermont paper says: "Among the conspicuous men in the Vermont Legislature is Mr. B. G. Brigham, of Fairfield. He owns and cultivates 1,300 acres of land. Among his barn-yard items are two hundred and twenty cows, twenty horses, and five yoke of oxen. In his dairy he makes butter only. The average yield of butter from the milk of each cow is one hundred and fifty pounds. Two huge 'dasher' churns are set in motion by two 'horse-powers,' and the butter is 'worked' by the old-fashioned 'paddle.' His stock of cattle consume about five hundred tons of hay annually. 20,000 lbs. of pork, 500 bushels of wheat, from 400 to 500 bushels of corn, 1,000 bushels of oats, and from 1,000 to 2,000 bushels of potatoes, are among his yearly products. 'The Man of Uz,' in his best estate, could not do better than this. Mr.

Brigham himself is got up with a breadth of beam, and in a style of magnificence proportionate to the extent of his possessions and agricultural products—he standing 6 feet 4 in his boots, and weighing, by one of Fairbanks' patent balances, 300 lbs. precisely."

RAIN IN JULY AND AUGUST.

THE following statement, showing the amount of rain which fell in the different States of the Union during the months of July and August, we copy from the Washington Globe. We presume it was compiled from the records in the Smithsonian Institute:

In the following statement we have grouped adjoining States and sections, where the amount of rain which fell was nearly the same. The figures giving the amount of rain are intended to represent the average, according to observations taken in different parts of each State:

In Maine, New Hampshire, and Vermont, it was very dry during both July and August. Rain in July, one and a half inches; in August, one half inch.

In Massachusetts, Connecticut, and Rhode-Island, plenty of rain fell during the month of July, nearly or quite up to the average, but hardly any in August. Rain in July, three and a half inches; in August, half an inch.

In New-York State in July, two and a half inches of rain fell—about an average. During the month of August there was but little rain in the northern section—half an inch; in the southern, one inch; and in the city one and a half inches.

In New-Jersey and eastern Pennsylvania, there was no drouth in July. Rain in July, three and a half inches; in August one inch.

In western Pennsylvania, Ohio and Michigan, rain, during July, fell one and a half inches—in some places less; in August, one half inch.

The amount of rain which fell in Maryland and northern Virginia, according to the tables, is nearly the same. Some parts of Maryland suffered from the drouth more severely than others. Rain in July, one and a half inches; in August one and a half inches.

In both North and South Carolina there was plenty of rain during the two months, and the papers in both States during the prevalence of the dry weather complained of too much rain in July. Rain in July, five inches; in August, four and a half inches—nearly an average.

In lower Georgia, Florida, and Louisiana, there was no drouth in either the month of July or August, but rather more than the average amount of rain fell. Rain in July, five to six inches; in August, five to six inches.

In Upper Georgia, Alabama, and Upper Mississippi, a fair amount of rain fell in both months. Rain in July, two inches and a half; in August three inches.

In Lower Mississippi and Texas, during both months, abundant rain; very profuse rain in July, five to six inches; in August five to six inches.

Rain in Tennessee, in July, two and a half inches; in August, half an inch.

In Kentucky, during both months, the drouth was very great, and the crops suffered severely, though a fair amount of rain fell. Rain in July, one and a half inches; in August, one and a half inches.

In Indiana, during both months, there was a fair amount of rain in most parts of the State, but not up to the average. Rain in July, two and a half inches; irregular, in August, two and a half inches.

In Illinois Missouri, and southern Iowa, extending west to Fort Kearny, and taking in western Arkansas, but little rain fell in either July or August. Rain in July, one inch; in August, one inch.

In northern Iowa, rain in July, four inches; in August three inches; plenty of rain.

In Wisconsin there was great abundance of rain, more than an average in July. Rain in July, in some parts, eight inches; other parts, four and a half inches; at the Falls of St. Anthony, five inches; in August, from two and a half to three inches

KEEPING SWEET POTATOES.

George D. Norris of New-Market, in the northern part of Alabama, and within a few miles of the Tennessee line, where the thermometer sometimes sinks to zero, and again rises so as to render fire uncomfortable, has been for many years past very successful in keeping the sweet potato. He expresses the opinion in the Farmer's Companion, that sweet potatoes may be kept as well at the north as at the south. He does not usually lose a peck in 400 bushels. His method is in substance as follows: Provide a good open shed, on a dry, well-drained piece of ground, around which a good trench is cut. As soon as the autumnal frosts have killed the leaves, carefully dig the potatoes, handling them as if eggs, and make piles of them under the shed, each pile containing say ten or twenty bushels. The separate piles are, for the sake of removing a portion as wanted, during warm weather in winter, without disturbing the rest. Immediately cover each pile thickly with good wheat straw (not hay,) as light injures them, and cover the straw with a foot of earth. The shed keeps the whole dry. This is the whole process. It is found much better than packing in barrels with sand, which retains the moisture and rots them. The moisture is absorbed by the straw. They should never be bruised. The most successful keeper of the common potato we ever knew, always covered his large heaps (seventy or eighty bushels) with straw packed a foot thick, which absorbs the unnecessary moisture, so that he rarely lost a peck in one of these large heaps. Only three or four inches of earth was needed outside the straw; and if he had covered the whole with a shed, doubtless the roots would have been still more secure from any danger.

Country Gentleman.

CURING SHEEP SKINS WITH WOOL ON.—Take one teaspoonfull of alum and two of saltpeter; pulverize and mix well together, then sprinkle the powder on the flesh side of the skin, and lay the two flesh sides together, leaving the wool outside. Then fold up the skins as tightly as you can and put them in a dry place. In two or three days, as soon as they are dry, scrape them with a blunt knife till clean and supple. This completes the process, and makes a most excellent saddle cover. Other skins which you desire to cure with fur on, may be treated in the same way.

A LARGE YIELD OF CORN.—The "Elkton (Md.) Democrat" says that at Battle Swamp, G. J. Fisher, Esq., has raised 1,600 bushels of corn, on a sixteen acre lot, in that neighborhood, which two years ago was a sedge field. The lot had guano applied to it three times in that period; the first application was 200 lbs., the second 150, the third 400 lbs. to the acre, making in all 750 lbs. The corn was a white gourd seed, planted two and a half and three feet apart, with four stocks in a hill, and matured early.

You had better be poisoned in your blood than your principles.

ALL ABOUT COOKING EGGS.

TO BOIL EGGS.

Put a pint of water into a small pan; when boiling, put two eggs in, and boil according to size—from two and a half to four minutes. Fresh-laid eggs will not take so long, and if only just set, are excellent for clearing the voice.

To boil them for toast, they require six minutes; take them out, throw them in cold water, remove the shell, and cut them into slices; put them on the buttered toast, a little pepper and salt, and serve. These are excellent with a little ketchup put on the eggs, then bread-crumbed, salamandered over, and serve.

BAKED EGGS.

Put half an ounce of butter into a small tin pan; break four eggs in it, keeping the yolks whole, throw a little pepper and bits of butter and salt over; put in the oven, or before the fire, till set, and serve. They will take about six minutes doing.

POACHED EGGS.

Put in a small pan half a pint of water, half a teaspoonful of salt, three of vinegar; when boiling, break carefully in the pan two nice eggs, simmer for four minutes, or till firm, but not hard; serve either on toast or fried bacon, or ham, or spinach, and on any minced and seasoned vegetable.

MIXED EGGS.

Break four eggs into a frying-pan, in which you have put two ounces of butter, a little salt and pepper; set it on the fire, stir round with a wooden spoon very quickly, to prevent sticking to the pan; when all set, serve either on toast or dish. Fried bacon cut in dice, a little chopped onions, or mushrooms, may be added to the above.

EGGS AND BACON.

Cut some bacon very thin, put into a frying-pan half an ounce of butter, or fat, lay the bacon in it; when fried on one side, turn over, and break one egg on each piece; when the eggs are set, put the slice under the bacon, and remove them gently into a dish. Ham may be done the same.

EGGS CONVENT FASHION.

Boil four eggs for ten minutes, put them in cold water, peel and slice thin one onion, put into a frying-pan one ounce of butter; when melted, add the onion, and fry white, then add a teaspoonful of flour, mix it well, add about half a pint of milk, till forming a nice white sauce, half a teaspoonful of salt, and a quarter ditto of pepper; when nicely done, add the eggs, cut into six pieces each, crossways; toss them up; when hot through, serve on toast.

EGGS AND SAUSAGES.

Boil four sausages for five minutes, when half cold cut them in half lengthways, put a little butter or fat in frying-pan, and put the sausages in and fry gently, break four eggs into pan, cook gently, and serve. Raw sausages will do as well, only keep them whole, and cook slowly.

OMELETTES.

Break four eggs into a basin, and half a teaspoonful of salt and a quarter ditto of pepper, beat them up well with a fork, put into the frying-pan one ounce and a half of butter, lard, or oil, which put on the fire until hot; then pour in the eggs, which keep on mixing quick with a spoon until all is delicately set; then let them slip to the edge of the pan, laying hold by the handle, and raising it slantways, which will give an elongated form to the omelette; turn in the edges, let it set a moment, and turn it over on to a dish, and serve. [Exchange.]

PROSPERITY is no just scale; adversity is the only true balance to weigh a friend.

NEVER speak lightly of religion.

Horticultural Department.

GRAPES RIPENING EARLIER THAN FORMERLY.

METHOD OF CULTIVATION MORE IMPORTANT THAN CLIMATE.

In a recent conversation with Dr. Underhill, of Croton Point, he informed us that both the Isabella and Catawba are evidently ripening earlier, from year to year. Ten to twelve years since the earliest bunches of Isabellas were ready for market about the first of October. The past season they were equally forward on the 12th of September. This season has, however, been a remarkable one, and some allowance is to be made on that account; but last year, and the year before, the grapes were as mature about the 18th of September, as formerly at the end of that month.

Dr. U. thinks the Isabella may be cultivated much farther north than has generally been supposed, by reducing the amount of fruit to the vine, so that there may be a greater flow of sap, and by this means an earlier growth and maturity secured. He thinks much more depends upon the method of manuring, pruning and the general plan of cultivation, than upon climate, since they often ripen poorly even in Virginia and Maryland, when improperly managed, and yet, in the same season, ripen well in Massachusetts.

GRAPE BORDER FOR OPEN CULTURE.

We have just finished a border, and as it fills up our ideal of what a border ought to be, we will give our method of proceeding, and items of expense, for the benefit of all lovers of grapes. It is undoubtedly true, that you can grow grapes in any soil that will grow corn; but grapes, in their perfection, can only be grown so far north as New-England, with extra care. We think perfect grapes at any reasonable cost, are much cheaper than the poor, sour, mildewed articles one often sees under the names of Catawbas, and Isabellas. Well ripened grapes are always salable, at good prices, while a poor article can neither be eaten nor sold with profit.

The part of the garden selected for a border had recently been cleared of stones, and for two successive years, had been trenched and heavily manured. It slopes about two feet in fifty, so that a drain, laid parallel with the surface, would carry off all the water. It is so situated that the water from the sink-drain can be turned on to the upper end at pleasure, and be made to run the whole length of it.

On this slope we cut a ditch four feet wide and four feet deep. In the bottom we found gravel and sand which was screened for the purpose of mixing with the water-lime. The pebbles also furnished excellent packing about the joints of the tile. When the ditch was properly graded at the bottom, we drew a line from one end to the other, very "taught." This served as a guide to perfect the grade where it was not even, and to lay the cement. The cement we prepared by mixing a bushel of water-lime with two

bushels of sand. The mixing was done in a dry state, and then about a pail full made into mortar at a time.

Taking a straight-edged board, three inches wide by six feet long, we placed it flat-wise immediately upon the line, and commenced laying the mortar and smoothing it with a common trowel. When we had put down cement the length of the board, we immediately put down the horse-shoe tile upon it; moving the board along the next six feet, we repeated the operation, and so on, until the whole sixty-five feet of the border was finished. The foundation of the border was now laid, the lower end of the drain emptying on to a terrace below, and the upper end communicating with a chimney, so as to give a constant circulation of air after the ditch was filled up. The next step was to guard the joints of the tile against the dirt which would naturally work into the crevices. We put around each joint enough of sifted pebbles to completely cover it, making a strainer. As an additional precaution, and to furnish lime for the plants, we put in a load of oyster-shells, completely covering the tile.

The next step was to furnish food for the vines for a long series of years. We procured from a butcher's yard a half ton or over of fresh bones, the heads of beeves, calves, and sheep, with scraps of wool, hair, and skin, and laid them immediately upon the oyster-shells. On the bones we put a layer of corn-stalks and salt hay, as a still further protection to the drain. We then filled in a few inches of the earth that had been thrown out of the ditch. The next item of food for the vines was a layer of charcoal cinders, taken from the privy vault. This was covered with muck, two or three inches deep. Coarse stable-manure was laid upon this, then a layer of surface-earth, then stable manure, &c., and finally surface-soil finished the border.

We planted two Catawbas and four Dianas in this border, mixing crushed bones and the saturated charcoal cinders with the soil about the roots of each plant.

A border thus thoroughly prepared, we think, will have several advantages over ordinary planting. It will pass off the excess of water in the Spring, and raise the temperature of the soil so that the vines will start earlier, and the fruit will come to maturity several days sooner. We think Catawbas can be grown further north, in this way, than in undrained soil.

The constant circulation of air through the drain will be a good safeguard against the drouth of our Summers. The grape is a gross feeder and often suffers from the drouth.

Liquid manures can be applied in any quantity without damaging the roots of the vines. The soap-suds from the sink-spout can run upon the border, through the Summer, furnishing the vines with potash, and giving fruit and foliage the greatest luxuriance. Potash is a specific fertilizer for the grape. We think, also, the drain will be a great safeguard against the mildew.

It will, perhaps, be thought that this is too

much trouble and expense for a few grapes. But "what is worth doing at all, is worth doing well," will be found a safe maxim in gardening. The bill is not very extravagant. One bushel of lime, 50 cents; one load of bones, \$2; oyster shells, 50 cents; manure, \$3; four days' labor, \$4; sixty horse-shoe tiles, at four cents each, \$2 40—making the whole bill \$12 40. If any one thinks this too much to pay for grapes for his family, for a generation, he appreciates that fruit less than we do. Any man of common ingenuity can do the whole work, and where the manure is made upon the premises the expense would be lessened. The vines were of our own growing, and these we have not reckoned in the cost. If they must be purchased, it will bring your whole bill within twenty dollars, which is much less than many a head of a household wastes on much meaner gratifications.

FACTS IN GRAPE CULTURE.

E. A. MCKAY, of Naples, N. Y., gives, through the Horticulturist, some interesting facts in regard to the mode adopted by him in the cultivation of an acre of Isabella grape vines. The vines were planted five years ago last spring, one vine to a square rod. The holes are dug to about two feet deep and six to eight feet across. In the bottom of each of these holes was placed half the carcass of an ox—a drove of eighty oxen having died in the neighborhood while on their way to market. The holes were then half filled with good surface soil. Sixteen loads of leather shavings, which had been accumulating at a currier's shop, were then divided equally among the 160 holes, which were then filled by surface soil, mixed with the leather. A bushel of well-rotted stable manure, mixed with the same quantity of charcoal dust, completed the preparation for the vines. He states that most of the vines measured last spring, a foot in circumference, some of them fifteen inches, and one seventeen inches. He allowed them to bear considerably the past season, and the quality of the fruit was so superior as to command fourteen cents apound, when most grapes of the same kind were selling at the same place at twelve and a half cents a pound. The crop of the present season he estimated at 20 lbs. to the vine, or 3,000 lbs. to the acre. He states that he has repeatedly dug down to the bones, and found them "completely surrounded with a net-work of living, fibrous roots."

SULPHUR WITH LIME VS. MILDEW.

In a small vineyard here, 34 feet long, two vines were planted, one at each end; three shoots were trained horizontally from each other alternately. At the end of five years the shoots from each had nearly reached the opposite ends; they have been spurred and have borne abundant crops every year, a little fire heat has been used, and the fruit ripens generally about the middle of August. In June, 1852, although it will be observed the vines were trained horizontally, mildew made its appearance in spots all over the house; a little sulphur was used, but the disease increased over every shoot, leaf and bunch, and the grapes were nearly all useless. Again, in June, 1853, the mildew made its appearance, sulphur was more liberally used, but the disease increased, although checked a little, and the bunches were all affected. This year, 1854, early in February, the house was washed with lime-

water with a little sulphur in it, every available piece of plaster and brickwork, the fine included, being operated on; in June, the same suspicious spots of mildew made their appearance; in the evening when the flue was just hot enough to bear the hand on it, it was done over with a mixture of sulphur and water, with a little lime in it, and again repeated at a week's end. The mildew entirely disappeared, and the grapes ripened at the usual time, an excellent crop. The idea of washing the flue with sulphur was taken from an article in your volume for 1853, and I think it is an invaluable recipe. D. S. WOODBRIDGE, Suffolk. *Gardener's Chronicle.*

SEEDLING PEACHES.

WE consider it to be an object for all engaged in the cultivation of peaches to regard more favorably the importance of raising seedling peach trees, and not depend too much upon raising foreign varieties by budding. September is the most favorable month for selecting pits of the most choice kinds to grow seedlings from. Procure peaches of the largest and most desirable sorts, ripening from the middle of August to the last of September, and a few October peaches of good quality. When the pulp is removed, place the pits in separate parcels, according to variety, in a cool and rather moist place. We prefer white peaches, because in a cold, wet season the yellow varieties are more acid. If possible save no pits from a tree that grew in a garden or orchard where inferior kinds were grown; if this can not be done, get them from trees as far distant as possible.

At any time before the ground freezes up, select a safe place—put the pits in the earth and cover them with about three inches of soil, and permit them to remain unmolested until early in the Spring. Having prepared the ground, mark it off into drills with a plow or hoe. Crack such of the pits as are not opened by the action of the frost; plant them about ten inches apart in the drills, and cover about two inches. When sufficiently large prune all the branches off that are below one foot from the ground. Cut none from the tree above a foot.—in after culture trim according to the shortening-in mode of pruning. Transplant at one year old.

If proper care is observed in selecting and preparing the pits, there will hardly be a failure in having peaches as good, probably some superior, to the parent trees, the seedlings often partaking of the qualities of the two kinds growing near each other.

Michigan Farmer.

ABELIA UNIFLORA.

THE management of this really pretty, hard-wooded green-house plant is very simple, and although it is considerably less vigorous in habit than *Abelia floribunda*, it flowers much more freely than that species, producing, when well grown, its delicate purplish-white pentstemon-like flowers in profusion. Cuttings of this *Abelia*, selected from the half-ripened wood, root readily in the propagating house, if inserted under a bell-glass not later than the middle of October. The contents of the cutting-pot should be one-third crocks for drainage, one-third finely-sifted peat and sand, surmounted by an equal quantity of clean silver sand. By the second week in November the cuttings will be sufficiently rooted to dispense with the bell-glass; the young plants should then be gradually inured to light and air, preparatory to being removed to their winter quarters, on a shelf as near the glass as may be convenient, in an airy part of the green-house, where, if proper care be taken not to over water them, by the first week in the following March the young stores

will have acquired sufficient strength to be potted singly into 3-inch pots. For compost use two-thirds turfy peat and one-third sharp sand. After potting, and until the roots begin to penetrate the fresh mould, the plants should be kept close, after which they can be removed to the platform or stage of the green-house. They will now commence growing freely, the pots will become filled with roots, so as to require a second shift into 5-inch pots. The same compost as before should be again employed; pot firmly, and drain well. The plants should be neatly staked and tied out, and should be rearranged in their former situation. They will now require plenty of water and a constant supply of air; and in order that the future specimens may exhibit a stocky and furnished appearance, the laterals should not be permitted to grow (without being stopped) any length beyond what the intended shape of the plants require. Pursue this course until the middle of the following August, when the final shift for the season may be given with safety, using 6-inch pots for the purpose. They should be allowed to complete their growth, and be wintered in the green-house. Treated as above, this *Abelia* may be had in full bloom by the end of the following May, and it will continue to produce a good supply of flowers during the three succeeding months. R. MILES. *Gardeners' Chronicle.*

OHIO POMOLOGICAL SOCIETY.

THIS society will hold its sixth session at Cleveland, on the 5th of December. An effort is being made to collect a valuable class of facts in regard to fruit culture at the West. A circular, addressed to the members, requests each to come prepared to submit accurate information on the following points, viz: The fruits cultivated in his region, both by himself and others, giving the proper name, and all local and other synonyms within his knowledge. The character of both surface and subsoil where each fruit is grown; the aspect and elevation; whether level or sloping; the varieties of soil; locations; manures, method and time of applying them; productiveness; pruning, &c.

The influence of the stock on the health and duration of the varieties grafted, or budded on the same, and the relative merits of the two modes of propagation, if any. Also the relative effect of root grafting—as practised by many nurserymen—and stock grafting, on the health and duration of the tree.

Observations on insects injurious to fruit, trees, and vines. The diseases or maladies to which they are subject, with the best modes to counteract these evils—with any other information of interest on the subject.

A NEW PLAN TO SAVE PEACH TREES.—A writer in the New-York Times recommends the sowing of tansy about the roots of peach trees, as a means of preserving them. He says that he once knew a large peach tree which was more than forty years old, while several generations of similar trees, in the same soil, had passed away. This led to an examination, and a bed of tansy was discovered about the trunk. It was naturally inferred that the preservation of this tree to such a green old age was attributable to the presence of this plant. I was decided to try the experiment on others, and accordingly a few of the roots were placed about each of the other trees on the premises, some of which gave signs of decay. Not only has it preserved for several years the sound trees, but renovated those that were unsound. The odor of the plant, he says, doubtless keeps off the insect enemies of this kind of tree, and it might have the same effect on others, as the plum, apple and pear, as well as the elm, sycamore and other ornamental trees.

American Agriculturist.

New-York, Wednesday, Nov. 15.

A WORD TO CARELESS CORRESPONDENTS.

WE publish the following letter received, that the writer may know that we have his money, and that his paper will be sent when he tells us to which one of the seventeen Milfords, in the United States, it shall be mailed—and also to call attention to the necessity of avoiding a very common thoughtless habit :

MILFORD, NOV. 2, 1854.

MESSRS. ALLEN & Co.:

Gentlemen: Please send me the Agriculturist to this office for one year. I inclose two dollars to pay for the same.

Respectfully yours, G. E. D—.

It is annoying to receive, as we frequently do, letters to which we can not reply; and probably correspondents frequently complain of our inattention, when the fault is all their own. If the Post-master's stamp on letters, when this is readable, did not give us a clue to the State, as well as the town, our correspondents' favors would still more frequently receive no reply. We keep an alphabetical index of the names of Post-offices where subscribers reside, but not of the individual names, as this would be an endless task.

OSAGE ORANGE SEED.

PREPARATION FOR PLANTING.

WE have had frequent inquiries of late as to the preparation of Osage orange seed before planting; and we republish some of the methods which have proved most successful:

The seed of the Osage orange is so closely bound up in the fibrous substance of the fruit, that it takes a long time for it to receive from the soil enough moisture to induce sprouting. To effect this, the process recommended by H. P. Byram, of Louisville, Ky., is a good one, viz: Put the seed to soak two weeks before planting, in vessels containing not more than two quarts each, and let it stand for three days. The water is then turned off, and the seed, covered with a cloth, is set in a warm room, taking care to keep it moist. If the weather prove favorable the process may be hastened by placing the vessel in a hot-house; in either case, the seed is planted as soon as it begins to germinate.

It has also been recommended to soak the seed in warm water, until it begins to swell; or, after having soaked twenty-four hours, that it be tied up in a bag and buried in moist earth, examining it weekly to see when the sprouting begins. There is also another method—of soaking the seed *two weeks* before planting.

Our method has been, to steep the seed in a mixture of warm water and soot, and after letting it stand eight days under the stove, to sow it in ground carefully prepared, and in drills eighteen inches apart, after the manner of peas. In about six weeks, it comes up, and after being weeded and properly attended to, grows vigorously.

MESSRS. MORRIS AND BECAR'S STOCK.

DUKE OF GLOSTER

ABOVE we have the pleasure of presenting our readers with a cut of the Short Horn bull Duke of Glo'ster, (11,382), one of the very choicest animals that was ever imported into this country. He was calved Sept. 14th, 1850; got by Grand Duke (10,284), out of Duchess 59th, by 2d Duke of Oxford (9,046); Duchess 56th, by 2d Duke of Northumberland (3,646); Duchess 51st, by Cleveland Lad (3,407); Duchess 41st, by Belvidere (1,706); Duchess 32d, by 2d Hubback (1,423); Duchess 19th, by Hubback (1,423); Duchess 12th, by the Earl (646); Duchess 4th, by Ketton 2d (710); Duchess 1st, by Comet (155); by Favorite (252); by Daisy Bull (186); by Favorite (252); by Hubback (319); by J. Brown's Red Bull (97).

The Duke of Glo'ster was purchased at the late Earl Ducie's sale, in August, 1853, for 650 guineas (\$3,250), by Messrs. Becar and Morris, of New-York. These gentlemen had instructed their agent to bid as high as 1,200 guineas (\$6,000), rather than not obtain him. He was left after his purchase with Mr. Tanqueray, of England, till last month, when he was shipped to his owners in New-York, where he arrived in excellent health, and was immediately sent to the farm of Mr. Morris, at Mount Fordham, Westchester. We are informed that if his owners would have left him in England, they could have taken 1,000 guineas (\$5,000) for him, so highly is he esteemed there.

The Duke of Glo'ster, though in excellent health when we called to examine him, active and in good working order, was not in what may be termed *tip-top show condition*; having suffered somewhat, as all large animals inevitably must on a long voyage across the Atlantic. We intend to speak of him critically hereafter, when he has got completely over the effects of his voyage; and therefore content ourselves at present by saying, his color is nearly all red, mingled with a little white; and that he has the characteristics in an eminent degree of the fam-

ous Duchess tribe of Short Horns, as bred in such high perfection by the late Thomas Bates, of Yorkshire. The engraving of the Duke of Glo'ster, above, is a good likeness, and our readers can judge from that as well as ourselves, whether this high bred and famous animal is worthy of their consideration.

After examining the bull we walked out to an adjoining meadow to take a look at Duchess 66th, also purchased at Earl Ducie's sale, at the same time as the Duke of Glo'ster. For her, Messrs. Becar and Morris paid 700 guineas (\$3,500), the highest price ever yet given for a Short Horn cow in England. If her present owners would have left her there, they could also have taken a large advance over what was paid for her; but as they are quite as able to hold such animals as John Bull himself, and moreover take no little pride and pleasure in breeding choice stock, and are ambitious to stand as high as any other gentlemen in this department, they wisely, as we think, declined all offers, and brought her to this country as a mate to the Duke. Her color is rich roan. She is of great size and constitution, a deep milker, fine in all her points, and one of the most noble and imposing cows we ever looked at. She will be a wonder among the public when brought to the show yard, that is certain.

Duchess 66th was calved October 25th, 1850; got by 4th Duke of York (10,167), out of Duchess 55th, by the 4th Duke of Northumberland (3,649); Duchess 38th, by Norfolk (2,377); Duchess 33d, by Belvidere (1,706); Duchess 19th, by second Hubback (1,423); &c., as in the pedigree of the Duke of Glo'ster above.

We congratulate Messrs. Becar and Morris, and the public, upon the acquisition of such valuable stock; and all we have left to desire is, that it will breed long and well here, and be duly appreciated by our countrymen.

HAVE no very intimate friends,

THINGS I SEE HERE AND THERE.

BY MINNIE MYRTLE.

I sometimes see two families living side by side, with nearly the same means and the same in numbers; and one is in constant turmoil and confusion, and the other always quiet, pleasant and agreeable. What makes the difference? In one the lady has been rightly and thoroughly educated for her profession, and in the other every thing connected with house-keeping is new and distasteful. To one the broom and the dish-cloth and the gridiron are familiar things. She does not consider her hands polluted by any of the implements of cooking, and she never has a servant as wise as she is herself in the mysteries of pounding and compounding, and therefore she is never deceived and never imposed upon.

The other hates the sight of a kitchen, and knows nothing about the preparation of any article of food which she is in the habit of ordering, and therefore does not know whether she can afford it, nor whether, if prepared, it is done as economically as it might be and should be.

In one there are three servants, and every thing is half done and at "loose ends;" and in the other there is one servant, and a place for every thing and every thing in its place. What makes the difference? Only this: that one lady sees to every thing herself—looks into every nook and corner, and saves every crumb and scrap, and the other sees to—nothing.

I am far from thinking that every lady should cook, or wash, or iron, any more than that every man should dig, and plow, and mow, and thresh, when he can do something else to much better advantage. But the work of a farm is never done well when the owner does not sometimes work with his men. So the work of a house is never done well when she who directs does not prove that she can practice as well as preach.

I do not know a more thorough lady than this one whose house is always in such thorough order, nor one whose hands are so expert in every species of labor—one of the proofs, of which there are many, that a true lady makes the best house-keeper, and one who is not capable of making a good house-keeper is not capable of being a lady! though she may be very delicate, and knows how to bow, and courtesy, and dress, and dance.

I often hear it remarked of a family of daughters, "What excellent wives they will make!" because they are great workers. But those who work most do not always accomplish most. They often waste more than they save by their labor. It is a prevalent idea among farmers, and mechanics especially, that they must not think of having a lady for a wife, because they need a wife to work. While it is only a lady, a well-educated lady, who can work efficiently, economically, and systematically. No woman, under any circumstances, should be obliged or consent to drudge the whole time. Those who do, neglect their children, and destroy their health—make a wreck of their

nerves, and become fretful and useless ere life is half spent.

Comparisons are often made between our grandmothers and the mothers of the present day, recounting the great labors the former performed. But it was not so difficult obtaining good help in those days as in these, and those who were at all well off did not think of doing without it. Those who did, drove their children out of sight to take care of themselves, did what they could, and left the rest undone. They ate and drank, and lived from day to day, and year to year; but they did not live comfortably, or as Christian people should.

I know ladies whose husbands are enjoying an income of ten thousand dollars a year, who wash all the dishes of the family morning and evening, if the house is full of company, and rub the silver, skim the milk, take care of the butter, make all the sweet-meats, and go through the kitchen and pantries every morning and see that every thing is in order. These things they consider no part of a servant's business, as they certainly are not. This thorough supervision is every woman's duty, and every true woman's pleasure.

The farmer may work hard all summer and fall, but all the winter—especially in these days of threshing-machines—he may rest. But for his wife there is no rest—winter and summer are alike—"the work is never done."

Men, and farmers especially, are proverbial for liking to "live well," and it is this "living well" which makes slaves of the women the world over. They do live on the fat of the land—live a great deal too well for their health, and many of them too well for the interest of their pockets. Those who work hard need good nourishing food, but grease is not nourishing, and this ingredient is altogether too common in the dishes upon farmer's tables. The frying-pan is too frequently resorted to, for no kind of food, meat, vegetable, or cake, is healthy, fried. Meat should be roasted, broiled, or boiled, and cakes should be baked. This is the decision of all good physicians and physiologists; but people are such slaves to their palates, that it seems impossible to give any efficiency to the laws of health or comfort.

A farmer's family always have comfortable food: flour, rye, Indian corn, and buckwheat, with eggs, cream and milk in abundance, which may be moulded into infinite varieties of good things that are palatable and healthy.

When a young lady buys her crockery, it is just as well, and as cheap, to get that which corresponds, and will give a pretty look to her table, as to get a dozen different colors and forms; and then it does not take so long, when once the art is acquired, to arrange a table in a neat and orderly manner, as it does to have things here, there, and every where, in a different place every time.

On the table from which I have made this drawing, I dare say, no article has varied a hair's-breadth from its position for ten, and, perhaps, twenty years. It looks so simple,

and I know will look to many so ridiculous, that I hesitated long about transferring it to the *American Agriculturist*; but I know so well the way hundreds and hundreds of tables are laid, from mere thoughtlessness, that I venture to set this, hoping those who have every thing in "apple-pie order" will have patience with me for attempting to teach those who I know do not.

Fig. 1, is the breakfast and tea table, which are so nearly alike as to need but one representation; and I set a common, old-fashioned square table, presuming these are still the most common—though I hope they are not, as oval ones are prettiest and most convenient.

Fig. 1.—Breakfast and Tea.

T..Tray. W..Warm bread or muffins—meat, for
B..Butter. G..Cold bread. [breakfast.
P..Preserves. L..Cake—Salt and pepper at breakfast.
C..Cheese. E E..Extras.
*..Plates. *††..Plate, knife and fork.

Knife and fork handles together, blade of knife toward the plate. Tray always covered with a white napkin—cups and saucers on the side toward the lady who pours the tea, and sugar-bowl and cream-pot opposite.

Fig. 2.—Dinner.

R..Butter. M..Meat. N..Sauce or cheese.
††. Vegetables. C..Castor. E E E E..Extras.
B..Bread. P..Potatoes. K±±..Pickles,
\$T\$ \$T\$. Salts, with spoons crossed each side—or in opposite corners of the table.

My table, it will be seen, is a good old-fashioned country table. It is not genteel in the city to have cheese for tea, (or any thing else!), but this fashion is very little heeded in the country.

At breakfast and supper the lady pours the tea while the gentlemen help to eatables. The quickest, most convenient, and handsomest way of helping at dinner, is, for the gentleman to put upon his plate meat and the vegetables nearest to him, and the lady put upon her plate those nearest to her, and then exchange, and each having supplied the plate taken from the other, hand it to those nearest, and so on, till all are helped.

Boys' Corner.

COUNTRY VS. CITY CHILDREN.

COMFORT TO ASPIRANTS AFTER CITY LIFE.

AMONG all the grateful gifts of summer, none, I think, has been deeper and more various, than the sight of the enjoyment of the children. I do pity children in a city. There is no place for them. The streets are full of bad boys that they must not play with, and the houses of furniture that they must not touch. They are always in somebody's way, or making a noise out of proper time—for the twenty-fifth hour of the day is the only time when people think children should be noisy. There is no grass for their feet, no trees for climbing, no orchards or nut-laden trees for their enterprize.

But here has been a troupe of children, of three families, nine that may be called children, (without offense to any sweet fifteen,) that have had the summer before them to disport themselves as they chose. There are no ugly boys to be watched, no dangerous places to fall from, no bulls or wicked hippogriffs to chase them. They are up and fledged by breakfast, and then they are off in unencumbered liberty till dinner. They may go to the barn, or to any of three orchards, or to either of two woods, or to either of two springs, or to grand-ma's, (who are the very geni of comfort and gingerbread to children.) They can build all manner of structures in wet sand, or paddle in the water, and even get their feet wet, their clothes dirty, or their pantaloons torn, without its being reckoned against them. They shuffle along the road to make a dust in the world, they chase the hens, hunt sly nests, build fires on the rocks in the pastures and fire off Chinese crackers, until they are surfeited with noise; they can run, wade, halloo, stubb their toes, lie down, climb, tumble down, with or without hurting themselves, just as much as they please. They may climb in and out of wagons, sail ships in the water-trough at the barn, fire apples from the sharpened end of a limber stick, pick up baskets filled with brilliant apples in competition with the hired men, proud of being "almost men." Their hands, thank fortune, are never clean, their faces are tanned, their hair is tangled within five minutes after combing, and a button is always off somewhere. The day is a creation especially made for children. Our Noble has been at least equal to one hand and one foot extra for frolic and mischief, to each of the urehins. But grandest of all joy, highest in the scale of rapture, the last thing talked of before sleep, and the first thing remembered in the morning, is the going for a-nutting. Oh! the hunting of little baskets, the irrepressible glee, as bags and big baskets, into which little ones are to disembogue, come forth! Then the departure, the father or uncle climbing the tree—"oh! how high!"—the shaking of limbs, the rattle of hundreds of chestnuts, which squirrels shall never see again, the eager picking up, the merry ohs! and ouches! as nuts come plump down on their bare heads, the growing heap, the approaching dinner by the brook, on leaves yellow as gold, and in sunlight yellower still, the mysterious baskets to be opened, the cold chicken, the bread slices—ah! me! one would love to be twenty boys or a boy twenty times over, just to experience the simple, genuine, full, unalloyed pleasure of children in a wood, with father and mother "a-nutting!" [Independent.

FORTUNE when once let go is seldom caught.

KEEP good company or none.

FORTUNES OF A PIN.

IN the year 1789, a boy, called Lafitte, first appeared in Paris. He was poor, and greatly desired to obtain an inferior place in a banking-house. Furnished with a letter of introduction, he went to the house of a rich Swiss banker to ask for employment. He was friendless, timid, and care-worn, and the banker thinking him unfit for a clerk, told him he had no room for him in his office.

The lad left the banker's richly gilded room with a sad heart. While crossing the court-yard, with drooping head, he saw a pin on the ground; he stooped down, took it up, and placed it carefully in the corner of his coat. He did not think at the time that this act, so trifling in itself, would be the turning point in his life, and the means of his future splendid success.

The banker saw from his window what had taken place, and, attaching great importance to trifles, he was impressed by the circumstance. This simple action gave him a key to the character of Lafitte. It was a proof of order and prudence. And he thought that a young man who could thus take care of a pin, would surely make a good clerk, and merit the trust and good wishes of his employer.

The same evening Lafitte received a note from the banker, offering him a situation in his counting-house, and asking him to come and fill the place at once.

The discerning banker was not deceived in his hopes; for he soon found that the young pin-saver possessed all the good qualities he expected. From a clerk Lafitte soon advanced to be cashier, and at length was received into partnership, and afterwards became the owner of the largest bank in Paris, and one of the richest men in the world. He was not only rich, generous, great and powerful, but was chosen a deputy of the people, and made President of the Council of Ministers, and was in every respect the most influential citizen of France.

Credit Lost.

STOLEN FRUIT.

IN Gunning's "Sketches," a new English book, he tells this story of Dr. Ogden, Professor of Geology:

The Doctor had taken a great fancy to a lad who had been in his service three or four years; he was much pleased with his management of a garden which was attached to his house, and of which he was particularly fond. A cherry tree which had been planted some time, which should have produced very choice fruit, had constantly failed. To the Doctor's great delight it at last showed signs of bearing, and about a dozen cherries after a while began to assume a tempting appearance. Returning one day from his ride, he missed some of his cherries and accused the boy of having taken them. "I have not touched them," replied the boy, "as true as God's in heaven," (a very common mode of assertion among inferior people at that time,) "That's a good lad! sit thee down, and I'll give thee a glass of wine, for thou wouldst not tell me a lie!" Going to a closet he put a pretty strong dose of antimonial wine into a glass which the boy drank off, and was preparing to leave the room but his master kept him in conversation. At length the boy was making a hasty retreat, saying he did not feel well. "Do not quit the room," said the doctor, "sit thee down thou wilt soon be better; and ringing the bell, he ordered a jug of warm water, which he administered very freely, at the same time providing a basin. The cherries soon made their appearance, as the Doctor anticipated, to the great consternation of the lad. "Where's the God in hea-

ven?" said the Doctor. "Thou miscreant! get thee out of my house!" He quitted it the same day, but not till the Doctor had shown him his will, in which he had left him two hundred pounds.

MY MOTHER KNOWS BEST.

A party of little girls stood talking beneath my window. Some nice plan was on foot; they were going into the woods, and they meant to make oakleaf trimming, and pick berries, and carry luncheon. Oh, it was a fine time they meant to have. "Now," said they to one of their number, "Ellen, run home and ask your mother if you may go. Tell her we are all going, and you must." Ellen, with her green cape bonnet, skipped across the way, and went into the house opposite. She was gone some time.

The little girls kept looking up to the windows very impatiently. At length the door opened, and Ellen came down the steps. She did not seem to be in a hurry to join her companions, and they cried out: "You got leave? You are going, are you?" Ellen shook her head and said that her mother could not let her go. "Oh," cried the children, "it is too bad! Not go! it is really unkind in your mother." "Why, I would make her let you." "I would go, whether or no."

"My mother knows best," was Ellen's answer, and it was a beautiful one. Her lip quivered a very little, for I suppose she wanted to go, and was much disappointed not to get leave; but she did not look angry or pouting, and her voice was very gentle, but firm, when she said: "My mother knows best."

There are a great many occasions when mothers do not see fit to give their children leave to go where and do what they wish to; and how often are they rebellious and pouting in consequence of it. But this is not the true way, for it is not pleasing to God. The true way is cheerful acquiescence in your mother's decision. Trust her, and smooth down your ruffled feelings by the sweet and beautiful thought, "My mother knows best." It will save you many tears and much sorrow. It is the gratitude you owe her, who has done and suffered so much for you.

LEARN ALL YOU CAN.

NEVER omit any opportunity to learn all you can. Sir Walter Scott said, that, even in a stage-coach, he always found somebody who could tell him something he did not know before. Conversation is frequently more useful than books for purposes of knowledge. It is, therefore, a mistake to be morose and silent, among persons whom you think ignorant, for a little sociability on your part will draw them out and they will be able to teach you something, no matter how ordinary their employment.

Indeed, some of the most sagacious remarks are made by persons of this description, respecting their particular pursuit. Hugh Miller, the Scotch geologist owes not a little of his fame to observations, made when he was a journeyman stone mason and working in a quarry. Socrates well said that there was but one good, which is knowledge, and one evil, which is ignorance. A gold digger takes the smallest nuggets, and is not fool enough to throw them away because he hopes to find a huge lump some time. So in acquiring knowledge, we should never despise an opportunity, however unpromising. If there is a moment's leisure, spend it over a good or instructive talking with the first person you meet.

JUDGE not the rich by their wealth, or the poor by their poverty.

Scrap-Book.

TO MY LOVED ONE IN HEAVEN.

THE eye must be dark that so long has been dim,
Ere again it may gaze upon thine;
But my heart has revealings of thee and thy home,
In many a token and sign;
I need but look up, with a vow to the sky,
And a light like thy beauty is there;
And I hear a low murmur like thine in reply,
When I pour out my spirit in prayer.

And though, like a mourner that sits by a tomb,
I am wrapt in a mantle of care;
Yet the grief of my bosom—O, call it not gloom!
Is not the dark grief of despair.
By sorrow revealed, as the stars are by night,
Far off a bright vision appears;
And hope—like the rainbow—a being of light,
Is born, like the rainbow, in tears.

I know thou art gone to the home of thy rest;
Then why should my soul be so sad?
I know thou art gone where the weary are blest,
And the mourner looks up and is glad;
Where love has put off, in the land of its birth,
The stain it had gathered in this;
And Hope, the sweet singer that gladden'd the earth,
Lies asleep on the bosom of bliss.

WHAT I LIVE FOR.

BY F. L. BANKS.

I.

I live for those who love me,
Whose hearts are kind and true;
For the Heaven that smiles above me,
And awaits my spirit too;
For all human ties that bind me;
For the task by God assigned me;
For the bright hopes left behind me,
And the good that I can do.

II.

I live to learn *their* story
Who've suffered for my sake;
To emulate their glory,
And follow in their wake;
Bards, patriots, martyrs, sages,
The noble of all ages,
Whose deeds crowd History's pages,
And Time's great volume make.

III.

I live to hold communion
With all that is divine;
To feel there is a union
'Twixt Nature's heart and mine;
To profit by affliction,
Reap truths from fields of fiction,
Grow wiser from conviction,
And fulfill each grand design.

IV.

I live to hail that season
By gifted minds foretold,
When men shall live by Reason,
And not alone by Gold;
When man to man united,
And every wrong thing righted,
The whole world shall be lighted
As Eden was of old.

V.

I live for those who love me,
For those who know me true,
For the Heaven that smiles above me,
And awaits my spirit too;
For the cause that lacks assistance;
For the wrong that needs resistance;
For the Future in the distance,
And the Good that I can do.

AT COURT.—A person recently returned from Europe, told his friends he had been presented at Court there.

"Did you see the Queen there?" asked one.

"Wall—no—I didn't see her, 'zactly; but I seed one of her friends—a judge. Yer see," he continued, "the Court I was presented at, happened to be a Police Court."

BETTER LAUGH THAN CRY.

So say we. There's no use in rubbing one's eyes and blubbering over all the ills that flesh is heir to. The best way is to stand up to the rack, and take the good things and the evil as they come along, without repining, always cheering yourself with that philosophical, "better luck next time."

Is dame fortune shy as a weazel? Tell her to go to Jericho, and laugh in her face. The happiest fellow we ever saw, worked hard, slept upon a plank, and hadn't a shilling in his pocket, nor even a coat upon his back.

Do you find disappointment lurking in many a place? Then throw it away, and laugh at your own folly for so long pursuing it.

Does fame elude your grasp? then laugh at the fools that are so often her favorites. She's of no consequence, and never buttered a piece of bread, or furnished a man a suit of clothes.

Is your heart broken by some maiden fair? Then thank God that you escaped with your neck, and make the welkin ring with a hearty laugh. It lessens the weight of one's heart amazingly.

Take the advice, under all circumstances, "laugh dull care away." Don't be in a hurry to get out of the world; it's a very good world, considering the creatures who inhabit it, and is about as full of fun as it can be. You never saw a man cut his throat with a broad grin on his face; it's a grand preventative of suicide. There's philosophy and good sense, too, in laughing—it shows a clear conscience, and a sincere gratitude for the things of life, and elevates us above the brute creation. So here goes for good humor, and we put in for our share while the ball is rolling.

PAT AND THE OYSTERS.

PAT, who had been transplanted, had been sent by his master to purchase a half bushel of oysters at a quay, but was absent so long that apprehensions were entertained for his safety. He returned at last, however, puffing under his load in the most musical style.

"Where have you been, Pat," exclaimed his master.

"Where have I been? Why, where should I be? To fetch the oysters."

"And what in the name of St. Patrick kept you so long?"

"Long! be my soul, I think I have been pretty quick, considering all things."

"Considering what things?"

"Considering what things? why, considering the gutting of the fish, to be sure."

"Gutting what fish?"

"What fish? why, blur-an'-owls, the oysters."

"What do you mean?"

"What do I mean? why. I mean that as I was resting down forment the Pickled Herring, having a dhrop to comfort me, a gentleman axed me what I'd got in my sack."

"Oysters," says I.

"Let's look at 'em, says he, and he opened the bag. "Och! thunder and praties," says he, "who sold you these?"

"It was Mick Carney," says I, "aboard the Poll Doodle smack."

"Mick Carney, the thief of the world! What a blackguard he must be to give them to you without gutting."

"Aint they gutted," says I.

"Mischief a one," says he.

"Musha, then," says I, "what'll I do?"

"Do?" says he, "I'd sooner do it myself than see you abused."

"And so he takes 'em in doors and guts them nate and clane, as you'll see," opening,

at the same time, his bag of oyster shells, that were as empty as the head that bore them to the house."

THE IRON INDIAN;

OR A RIGHT HANDER BADLY INVESTED.

"Thank you, I don't care if I do," said a fast young man, with a large pressed brick in his hat, as he surged up to the Indian that stands in front of Van Cott's tobacco-store, in Broadway, with a bunch of cast iron cigars in his hand. "I'll take one, I smoke sometimes," and he reached out to take the proffered weed, but the Indian would not give it up. He hung on to the cigars like grim death. "Look here, old copper-head," said the fast young man, "none of that, no tricks upon travelers, or there'll be a muss, you and I'll fall out, somebody'll get a punch in the head." The Indian said never a word, but held on to the cast iron cigars. He was calm, dignified, unmoved, as an Indian should be, looking his assailant straight in the face, and no muscle moving a single hair. "Yes! yes! Look at me old featherhead! I'm one of 'em, I'm around, I'm full weight, potato measure," and he placed himself in a position, threw back his coat and squared off for a fight. All the time the Indian said never a word, looked without the least alarm unwinkingly straight into the face of the fast young man, still holding out the cigars in a mighty friendly way. The young man was plucky, and just in a condition to resent any sort of insult, or no sort of insult at all. He was ready to "go in," but the calmness and imperturbability of the Indian rather cowed him, and he was disposed to reason the matter. "I'll take one," said he, "certainly; I said so before, I freeze to a good cigar; I'm one of the smokers. My father was one of the smokers, he was; one of the old sort, and I'm edition number two, revised and corrected with notes, author's hand-writing on title-page, and copyright secured. Yes, I'll take one." But the Indian said not a word, all the time looking straight in the face of the fast young man, and holding on to the cigars. "Look here old gimlet-eye, I'm getting riled, my back's coming up, and you and I'll have a turn; smell of that, old copperhead;" and he thrust his fist under the nose of the cast-iron Indian, who said not a word, moved not a muscle, but kept right on, looking straight into the face of the fast young man, as if not caring a fig for his threats, or taking in at all the odor of his fist. "Very well," said the fast young, "I'm agreeable—I'm around; look to your ugly mug, old pumpkin head;" and he let go a right-hander, square against the nose of the cast-iron Indian, who never moved an inch nor stirred a muscle—looking with calm, unchanged dignity, as before, in the face of his enemy. "Hallo," cried the fast young man, in utter bewilderment, as he reeled back half-way across the side walk, with the blood dripping from his skinned knuckles; "Hallo! here's a go—here's an eye-opener—here's a thing to hunt for around a corner. I'm satisfied, old iron-face, I am. Enough said between gentlemen." Just then he caught sight of the tomahawk and scalping-knife in the belt of the savage, and his hair began to rise. The Indian seemed to be making up his mind to use them. "Hold on," cried the fast young man, as he dodged round the awning post. "Hold on—none of that—I apologise—I squat—I knock under. Hold on, I say," he continued, as the Indian seemed to scowl with peculiar ferocity. "Hold on, very well, I'm off—I've business down the street—people are home waiting for me—can't stay," and he bolted like a quarter horse down Broadway, and his cry of "Hold on," died away as he vanished beyond the lamp-lights up Columbia-st. [Albany Register.

A DIG WITH A LADY'S PARASOL.

PUNCH, you naughty fellow!—You laugh at our bonnets, and the funny way in which we ladies wear them. I only wish you gentlemen would look at your own dress a little before you think of laughing at ours. Our bonnets, after all, are not half so ugly as your hats—nasty black things, that have no more shape in them than an elephant's leg. I'm sure I should be sorry to put the slice of a chimney-pot on my head! I wish you could see yourselves—you would be a little more careful then how you go out of your way to ridicule us. As for your scarfs, also—I would sooner go bare-necked than put round my throat anything half so nonsensical. Why, I have seen young gentlemen wear neck handkerchiefs no thicker than the ribbon we should think of putting round the neck of a kitten. They are not half so broad as watch-ribbons. I declare, in size they are no broader than the white satin favors we tie up wedding-cake with. You will be wearing your shoe-strings for a neck-tie next. I will tell you what they put me in mind of—whenever I see one of these pretty dears, I imagine he is the favorite lap-dog belonging to some lady, and has slipt his string. The next morning I expect to read in the papers an advertisement, describing his hair, ears, and eyes, and offering a reward of ten shillings if any one will return him to his disconsolate mistress. Mind, these are not shop-boys—these are not lawyer's clerks, or medical students; but elegant young men, who part their hair down the middle, indulge in the most extraordinary shirt-collars, sport black stripes down their legs, and altogether pretend to some degree of taste. Then the shirt-collars!—No military stock ever strangled a poor, unfortunate soldier half so cruelly as one of these “all round collars” cut and torture the unfortunate physiognomy that is locked up in it. What! if I were to direct public attention to these stupid stripes down your trousers? What do they mean? Are they useful? Are they even ornamental? Is it not an affectation of the military style, which argues that those who adopt it are anything but military men? Must you be marked all over like a giraffe!—must you be scored about with broad gashes like a leg of pork? You only see those black lines on the body of a mule; and we all know that the mule is the nearest approach to the donkey. I will not say anything more—but will simply conclude by asking you *cher Punchey*, if you think it is fair to attack us for anything ridiculous?—the ridicule with us sinning only on the side of beauty—while you, gentlemen, if you do sin in matters of dress, are sure to sin on the ugly side. I wonder you are not ashamed of yourselves.

Lady Correspondent of Punch.

STATISTICS OF MUSCULAR POWER.—Man has the power of imitating almost every motion but that of flight. To effect this, he has, in maturity and health, sixty bones in his head, sixty in his thighs and legs, sixty-two in his arms and hands, and sixty-seven in his trunk. He has also 434 muscles. His heart makes sixty-four pulsations in a minute; and therefore 3,840 in an hour, 92,160 in a day. There are also three complete circulations of his blood in the short space of an hour. In respect to the comparative speed of animated beings, and of impelled bodies, it may be remarked that size and construction seem to have little influence, nor has comparative strength, though one body giving any quantity of motion to another is said to lose so much of its own. The sloth is by no means a small animal, and it can travel only fifty paces in a day; a worm crawls only five inches in fifty seconds; but a lady-bird can fly twenty

million times its own length in less than an hour. An elk can run a mile and a half in seven minutes; an antelope a mile in a minute; the wild mule of Tartary has a speed even greater than that; an eagle can fly eighteen leagues in an hour; and a Canary falcon can even reach 250 leagues in the short space of sixteen hours. A violent wind travels sixty miles in an hour; sound, 1,142 English feet in a second. [Bueks.]

A MOTHER'S SUGGESTION ABOUT TRAINING CHILDREN.

WE have a friend, somewhat advanced in life, who has that best certificate of ability in a mother, viz: a most exemplary family; and we are often greatly interested in hearing her tell anecdotes of her experience in bringing them up. Some of these are too good to be lost, and for the benefit of our lady readers we repeat one.

When our friend was yet a young mother, she had two daughters, one less than two years older than the other. The eldest, Julia, was a petite beauty, very delicately formed, with regular features, clear complexion and bright golden ringlets. The second, Helen, was of larger growth, more childlike, with less of the statuary perfection of form and feature, a paler cheek and straight hair, which obstinately refused to be curled. Her principal beauty was the love-light in her serious contemplative face which was not so obvious to strangers. The children were so nearly of one size, and so constantly dressed alike, that they were thought to be twins; but the younger was comparatively unnoticed.

They were constantly together, while visitors at home and strangers abroad were daily or hourly exclaiming, “Oh, what a beautiful child! what lovely hair!” when looking at the elder sister. One day, after some ladies had passed out who had been very lavish of expressions of admiration for the golden curls, the little Helen came up to her mother's side, and with an unshed tear in her eye looked up and asked, “Mother, is not Helen's hair pretty, too?”

This was a revelation to the mother, and taking her up, she caressed the unpraised hair, and said how beautiful it was for mother, and how mother loved Julia and Helen both alike, and how dear they were to her. But experience had taught her that she could not prevent strangers admiring and caressing the one child, while they passed the other unnoticed, and thus make the one vain and the other sad. So, after a severe mental struggle, she resolved to sacrifice the external beauty of the elder to preserve her spiritual loveliness, and in half an hour Julia's golden curls and Helen's straight tresses were lying side by side in a paper envelope. In speaking of it she said, “Oh, it *did* appear so hard to cut off those curls, for I had been so proud of them; but when it was done, there was little difference in the children's appearance, and people took but little notice of them.”

At the age of three years the little Helen was beautiful in her shroud, and at thirty Julia wears her curls with a different grace and humility from what she would have done had she never so lost them, or been taught ever to esteem others more than herself.

Pittsburg Journal and Visitor.

NO EAR FOR MUSIC.—A soldier, many years ago, was sentenced for desertion, to have his ears cut off. After undergoing the brutal ordeal, he was escorted out of the court-yard to the tune of the rogue's march. He then turned, and in mocked dignity thus addressed the musicians, “Gentlemen, I thank you! but I have no further use for your services. I have *no ear* for music.”

CHEAP MICROSCOPE.

THERE is a man who sometimes stands in Leicester-square, London, who sells microscopes at one penny each. They are made of a common pill-box; the bottom taken out, and a piece of window glass substituted; a small hole is bored in the lid, and therein is placed a lens, the whole apparatus being painted black. Upon looking through one of these microscopes, I was surprised to find hundreds of creatures, apparently the size of earthworms, swimming about in all directions yet on the object glass nothing could be seen but the small speck of flour and water, conveyed there on the end of a lucifer match, from a common inkstand, which was nearly full of this vivified paste. I bought several of these microscopes, determined to find out how all this could be done for a penny. An eminent microscopist examined them, and found that the magnifying power was 20 diameter. The cost of a lens made of glass of such power would be from 3s. to 4s. How, then, could the whole apparatus be made for a penny? A penknife revealed the mystery. The pill-box was cut in two, and then it appeared that the lens was made of Canada balsam, a transparent gum. The balsam had been very cleverly dropped into the eye-hole of the pill-box. It then assumed the proper size and transparency of a well-ground lens. Our ingenious lens maker informed me that he had been selling these microscopes for fifteen years, and that he and his family conjointly made them. One child cut the pill-box, another the cap, another put them together, his wife painted them black, and he made the lens.

Dickens's Household Words.

PULLING TOGETHER;

OR A HINT FOR THE NEWLY MARRIED.

A bridegroom requested his wife to accompany him into the garden a day or two after the wedding. He then threw a line over the roof of their cottage. Giving his wife one end of it, he retreated to the other side, and exclaimed, “pull the line!” She pulled at his request as far as she could. He cried, “pull it over.” “I can't,” she replied. “Pull with all your might!” shouted the whimsical husband. But in vain were all the efforts of the bride to pull over the line so long as the husband held on the opposite end. But when she came round, and they both pulled at one end, it came over with great ease. “There” said he, “you see how hard and ineffectual was our labor when we pulled in opposition to each other; but how easy and pleasant it is when we both pulled together. If we oppose each other it will be pleasant to live. Let us, therefore always pull together.”

WHO WILL MAKE A GOOD WIFE.

WHEN you see a young woman who rises early, sets the table and prepares her father's breakfast cheerfully, depend upon it she will make a good wife. You may rely upon it that she possesses a good disposition and kind heart. When you see a young woman just out of bed at 9 o'clock, with her elbow upon the table, gasping and sighing, “Oh, how dreadfully I feel,” rely upon it she will not make a good wife. She must be lazy and mopish. When you see a girl with a broom in her hand sweeping the floor, with a rubbing board or clothes line in her hand, you may put it down that she is industrious, and will make a very good wife for somebody. When you see a girl with a novel in her left hand and a fan in her right, shedding tears, you may be sure that she is unfit for a wife. Happiness and misery are before you, which will you choose?

The man who is truly just will flourish in spite of envy.

The market this week commenced favorably, and as long as the weather was cool the demand was good and prices fair, owing probably to the rather light supply offered; but there is a decided change since Wednesday. Sheep and Lambs are more plenty, though the unfavorable weather has a tendency to reduce them about 14c. $\text{\$}$ lb. The week closes with an abundant supply on hand, and the prospect of weather bad. Mutton has been selling by the carcass in Washington Market from 4c. @ 8c. $\text{\$}$ lb., and lambs from 5 $\frac{1}{2}$ @ 11c., as in quality.

TO HORTICULTURISTS.—A person

who has been engaged in Horticulture for the last twelve years, will shortly be disengaged, and desires a situation in an extensive Nursery, or in connection with a Horticultural or Agricultural Periodical. Can give satisfactory reference as to ability, &c. Address S., Kingessing, P. O., Philadelphia Co., Pa. Refer to A. B. Allen, Office of the American Agriculturist. 61-73

A PAIR OF FINE COACH HORSES FOR

SALE.—Sixteen hands high, long tails; one six, the other seven years old; color gray. These horses are warranted kind, sound, strong, and enduring. They are offered for sale for no fault, but simply for not wanting their use the ensuing winter. They can be had for \$350, which is very cheap for them. Such horses are oftener sold at \$500 or \$600 in this city. Apply to 60-11 F. WOODFORD, 191 Water-st., N. Y.

CHOICE POULTRY.—C. C. PLAISTED,

of Great Falls, N. H., (late partner of Dr. John C. Bennett,) now offers for sale a large lot of choice POULTRY, viz:
 Four trons of Brahma Pootras, last year's fowls, from \$12 to \$18 a trio; 30 pairs of Chickens, from \$6 to \$10 a pair—bred from the Brahmas exhibited by Bennett and Plaisted, at the National Poultry Show, February last, and which were premium fowls. (Mr. P. has just sold the cock alone for \$50, to F. B. Bernard, of New-Orleans, La.) One trio of Hong Kongs, last year's fowls, price \$15; 4 pairs of Canton Cochins China Chickens, price \$8 a pair; 3 trons of Black Shanghais, price \$10 a trio; White Shanghais \$6 a pair; 24 pairs of Sumatra Pheasant Games—splendid fowls—at \$6 a pair; a few pairs of Malacca Games, at \$10 a pair; also English, Irish, Spanish, and Indian Games, at \$6 a pair, and one pair of very large Hong Kong Geese, price \$20.
 N. B.—The above lot of Poultry are all PURE BRED, and warranted as such. They are only offered at such very low prices because I have not room to keep so many through the Winter.
 Money may be sent at my risk, if inclosed and mailed in the presence of the Post-master. 62-65

RASPBERRY PLANTS, of the PURE

RED ANTWERP stock, for sale in quantities to suit purchasers. The Plants are all warranted, and in a thrifty condition, and will be delivered in New-York for \$50 per thousand. VALENTINE H. HALLOCK, Poughkeeps, N. Y.

P. S.—Orders by mail will be promptly attended to, and no charge made for postage. Orders to R. L. ALLEN, 189 and 191 Water-st., N. Y., will receive prompt attention. 60-11

FANCY FOWLS.—Shanghai Fowls—direct

importations—and Spangled Hamburgs, for sale by WM. DAY, Morristown, N. J. 52-6

IMPROVED SHORT HORN BULL FOR

SALE.—The subscriber offers for sale his superior Short Horn Bull, PRINCE ALBERT, that won the second prize at the recent State Fair held in the City of New-York.

Prince Albert was calved in 1849; his pedigree is of much merit; in color, he is a deep red with white marks; in temper, extremely mild and easily managed. He is an excellent stock-getter, and would not now be offered for sale, but that the subscriber, in the system of breeding he has adopted, has no further need of his services.

Under these circumstances, he is for sale at the low price of three hundred dollars. The animal may be seen at Ellerslie farm, one mile south of Rhinebeck station. Address personally, or by letter, WILLIAM KELLY, Ellerslie, Rhinebeck. 60-11

ANDRE LEROY'S NURSERIES, AT

ANGERS, FRANCE.—Mr. Leroy begs to inform his numerous friends that he is now prepared to execute all orders for TREES, EVERGREENS, SHRUBS, STOCKS, &c., entrusted to his care.

His Trees, &c., are very fine this year, and his collection very complete. Orders should be sent at once, so as to secure the different kinds. The best care will be given to all orders, as usual. The Angers Quince Stocks have not succeeded well this year, and are scarce and high.

Orders should be, as usual, addressed to our agent in New-York, Mr. EDWARD BOSSANGE, No. 138 Pearl-st., who will give all the information desired, and mail, on application, free of charge, a detailed copy of my catalogue, with prices, in dollars and cents. 60-12

TREES AND PLANTS.—PARSONS &

CO., Flushing, near New-York, offer for sale their usual assortment, with the addition of many rare novelties of Fruit Trees, for the Orchard and the Garden; Ornamental Trees, Shrubs, and Roses, for the Avenue, Lawn, or Cemetery; Vines for the Grapery, and Exotic Plants for Greenhouse culture. Catalogues can be obtained at No. 60 Cedar-st., or will be sent by mail to all post-paying applicants inclosing a postage stamp. 23-71

1,000 ORNAMENTAL TREES FOR

\$100—Suitable for Belts, Masses, Shrubberies, Woods, &c., in the best and hardiest varieties, strong and well grown—delivered in Boston and New-York. Price list on application. B. M. WATSON, Old Colony Nurseries, Plymouth, Mass. 56-63

IMPROVED ESSEX PIGS.—The sub-

scribers are now ready to engage pigs from Fall litters, got by their superior Boars, LORD WESTON and UNCLE TOM. Prices—\$25 per pair; \$15 a single pig.

Also, the reserved lot of five, from a Spring litter, which won the first prize at the New-York State Show this year; consisting of three hours and two sows. Price—\$20 each.

In all cases the money must be forwarded before shipment of the pigs; which will be well boxed, and sent by express or otherwise, as desired. W. P. & C. S. WAINWRIGHT, Rhinebeck, Dutchess Co., N. Y. 59-62

MULES FOR SALE.—The subscriber

keeps constantly on hand 400 to 500 MULES, of all sizes. Among these are some of the choicest animals in the United States; 16 hands and over in height, and well proportioned.

Mules are almost the only working animals used in portions of the Southern States, the West India Islands, and Spanish possessions, where severe work and hard usage are allotted them, and under which horses would soon die. An equal advantage would follow their introduction among farmers and others, in the northern States. They are not only much harder than horses, but they will draw more in proportion to their weight; will endure a great deal more; live twice as long, and eat less; and the only dressing or currying they need, is a soft place to roll on. They are gentle, tractable, and easily managed; and nobody who has ever tried them will ever give them up for horses or oxen. Call on, or address by letter, JAMES BUCKALEW, Jamesburg, New-Jersey. Refer to Amos Chamberlain, Bull's Head, 24th-st., N. Y. 159

SUPERIOR SEED WHEAT.—A LARGE

assortment of the best varieties of improved Seed Wheat; among which are the Red Mediterranean, White Mediterranean, Soule's and Blue stem. For sale by R. L. ALLEN, 189 and 191 Water-st. 54-11

FANCY FOWLS FOR SALE.—A variety

of pure bred Fowls, Asiatic, Spanish and Game Fowls, Sebright, Black African, Antwerp, and other Bantams. B. & C. S. HAINES, Elizabethtown, New-Jersey

Fresh Peruvian Guano, just received in store. R. L. ALLEN, 189 and 191 Water-st. 54-11

WILLARD FELT, No. 191 Pearl-street,

(near Maiden-lane,) Manufacturer of Blank Books, and Importer and Dealer in PAPER and STATIONERY of every description. Particular attention paid to orders. 26-77

MACHINE WORKS.—M. & J. H. BUCK

& CO.'S Machine Works, Lebanon, N. H., Manufacturers of a great variety of wood-working Machinery, of the most approved style, simple construction, and effective and firm operation, to be found in the country; comprising complete sets for making Railroad cars, doors, sash and blind, ship-building, bedsteads, cabinet, and carpenter work, &c. &c. Also, some machines of peculiar merit, such as for single and double Tenoning, capable of making from one to four tenons at the same operation of any width, size, or length, on large or small timber, with relining cylinder attached. Also, an improved timber Planing Machine, with the addition of a side-cutter, with which the top and edge of timber or plank is planed, whether square or bevel, at the same operation, and in the same time occupied in planing but one side on all other machines. They also manufacture circular, single, and gang Saw Mills, Flouring and Corn Mills, hand and power Hoisting Machines for storehouses, Shafting, Hangers, Pulleys, and Mill Gearing of all patterns.

MARTIN BUCK, J. H. BUCK, F. A. CUSHMAN, WM. DUNCAN,

AGENTS—R. L. Allen, 189 and 191 Water-st.; S. B. Schenck, 168 Greenwich-st.; Andrews & Jessup, 67 Pine-st.; Lawrence Machine Shop, 51 Broad-st., New-York, and Lawrence, Mass.; Leonard & Wilson, 60 Beaver-st., and Wm. F. Sumner, Crystal Palace. 36-11

FERTILIZERS.—Bone Dust, Guano,

Poudrette Plaster, and Super Phosphate, all warranted of the best quality. R. L. ALLEN, 189 and 191 Water-st. 57

LAWTON BLACKBERRY.—Genuine

Plants may be purchased of WM. LAWTON, No. 54 Wall-st., New-York. 57

Agricultural Implements.

AGRICULTURAL IMPLEMENTS.—The subscriber offers for sale the following valuable implements:

FAN MILLS—Of various kinds, for Rice as well as Wheat, Rye, &c.

GRAIN DRILLS—A machine which every large grain planter should possess. They are of the best patterns, embracing several varieties and sizes, and all the most valuable improvements.

SMUT MACHINES, Pilkington's, the most approved for general use.

HAY AND COTTON PRESSES—Bullock's Progressive Power-presses, and several other patterns, combining improvements which make them by far the best in use.

GRAIN MILLS, Corn and Cob Crushers, a very large assortment and of the best and latest improved kinds.

GRAIN MILLS, STEEL and CAST IRON Mills, at \$6 to \$25, and Burr-Stone at \$50 to \$250, for Horse or Steam Power.

TILE MACHINES—For making Draining Tiles of all descriptions and sizes.

WATER RAMS, SUCTION, FORCE and Endless-chain Pumps; Leather, Gutta Percha, India Rubber Hose, Lead Pipe, &c.

CALIFORNIA IMPLEMENTS OF ALL kinds, made expressly for the California and Oregon markets.

DRAINING TILES OF ALL FORMS and sizes.

THRESHERS AND FANNING-MILLS combined, of three sizes and prices, requiring from two to eight horses to drive them, with corresponding horse powers. These are the latest improved patterns in the United States.

SOUTHERN PLOWS—Nos. 10 $\frac{1}{2}$, 11 $\frac{1}{2}$, 12 $\frac{1}{2}$, 14, 15, 18, 19, 19 $\frac{1}{2}$, 20, A 1, A 2, Nos. 50, 60, and all other sizes.

PLOWS—A large variety of patterns, among which are the most approved Sod, Stubble, Side-hill, Double-mold, Sub-soil, Lock Coulter, Self-Sharpener, &c.

CARTS AND WAGGONS—With iron and wood axles, on hand or made to order, in the best and most serviceable manner.

HAY, STRAW and STALK CUTTERS of all sizes and great variety of patterns.

CORN SHELLERS—For Hand or Horse Power.

FARMERS AND MERCHANTS WILL find at my Warehouse every Implement or Machine required on a PLANTATION, FARM, or GARDEN. I would call attention to a few of many others offered for sale:

VEGETABLE CUTTERS and VEGETABLE BOILERS, for cutting and boiling food for stock.

BUSH HOOKS and SCYTHES, ROOT-PULLERS, POST-HOLE AUGERS, OX YOKES, OX, LOG and TRACE CHAINS.

Grub Hoes, Picks, Shovels, Spades, Wheelbarrows, Harrows, Cultivators, Road-Scrappers, Grindstones, Seed and Grain Drills, Garden Engines, Sausage Cutters and Stuffers, Garden and Field Rollers, Mowing and Reaping Machines, Churns, Cheese Presses, Portable Blacksmith Forges, Bark Mills, Corn and Cob Crushers, Weather Vanes, Lightning Rods, Horticultural and Carpenters' Tool Chests, Clover Hullers, Saw Machines, Cotton Gins, Shingle Machines, Scales, Gin Gear, Apple Parers, Rakes, Wire Cloth, Hay and Manure Forks, Belting for Machinery, &c. R. L. ALLEN, 189 and 191 Water-st.

GRASS SEEDS.—Timothy, Red Top, Kentucky Blue, Orchard, Foul Meadow, Ray, Sweet-scented Vernal, Tall Fescue, Muskitt or Texas, Tall Oat and Scurry.

Red and White Clover.
Lucerne.
Saintfoin.
Alyssa Clover.
Sweet-scented Clover.
Crimson or Scarlet Clover.

FIELD SEEDS.—A full assortment of the best Field Seeds, pure and perfectly fresh, including Winter and Spring Wheat of all the best varieties.

Barley.
Buckwheat.
Oats, of several choice kinds.
Corn, of great variety.
Spring and Winter Fitches.
PEAS, BEETS, CARROTS, PARSNIPS, and all other useful Seeds for the farmer and planter.

GARDEN SEEDS.—A large and complete assortment of the different kinds in use at the North and South—all fresh and pure, and imported and home grown expressly for my establishment.

MISCELLANEOUS SEEDS.—Osage, Orange, Locust, Buckthorn, Tobacco, Common and Italian Millet, Broom Corn, Cotton, Flax, Canary, Hemp, Rape and Rice.

FRUIT TREES.—Choice sorts, including the Apple, Pear, Quince, Plum, Peach, Apricot, Nectarine, &c., &c.

ORNAMENTAL TREES AND SHRUBBERY.—Orders received for all the native Forest Trees Shrubs and for such foreign kinds as have become acclimated. R. L. ALLEN, 189 and 191 Water-st.

POULTRY.—D. FOWLER, No. 14 Fulton Market, New-York, dealer in Live and Dressed Poultry of all kinds; for Shipping, &c. Also all the various kinds of Fancy Poultry, Pigeons, &c., for Breed.
N. B.—Persons having good Poultry to dispose of would do well to give Mr. F. a call before selling elsewhere.

gal Quince Stocks, embracing every thing worthy of cultivation.

All our Pear Trees are propagated and grown by our-

selves, and

WARRANTED TRUE TO NAME.

The soil, climate, &c., of this locality being so favorable to

the Pear, our Trees are unrivaled for HEALTH, vigor of growth,

&c., &c.

They are all free from that destructive malady,

THE PEAR BLIGHT,

which has never existed in this locality.

Prices low, and a liberal discount to the trade.

New-Bedford, 1854.

THE HORSE, THE HORSE,

NOBLEST OF DOMESTIC ANIMALS,

And the one most frequently ill-treated, neglected, and abused.

We have just published a Book so valuable to every man who

owns a horse, that no one should willingly be without it. It is

entitled,

THE MODERN HORSE DOCTOR,

and is from the pen of that celebrated English Veterinary Sur-

geon, Dr. GEO. H. DADD, well known for many years in this

country, as one of the most successful scientific and popular

writers and lecturers in this branch of Medical and Surgical

science. The Book which he now offers to the public is the

result of many years' study and practical experience which few

have had.

From the numerous and strong commendations, of distinguished

men and the newspaper press, we select the following:

Extract from a letter from Hon. John H. Clifford, Ex-Governor

of Massachusetts:

NEW-BEDFORD, May 11, 1854.

DR. DADD—Dear Sir: I hope your new work on the noblest

creature that man has ever been permitted to hold in subjection

—the Horse—will meet with that success which all your efforts

in this direction so well deserve.

Your obedient servant,

JOHN H. CLIFFORD.

From Hon. Marshall P. Wilder.

BOSTON, May 13, 1854.

DR. DADD—My Dear Sir: I am greatly obliged to you for the

valuable treatise, the results of your own investigations, which

you have recently issued, hoping that it may meet with the

patronage of a discriminating community.

I remain yours with great regard,

MARSHALL P. WILDER.

The "Modern Horse Doctor," by Dr. G. H. Dadd, is a manual

of genuine science, and ought to be owned and studied on the

score of humanity, as well as interest, by every man who owns a

horse. [Boston Congregationalist.]

Dr. Dadd has had great experience in the cure of sick horses,

and explains the secret of his success in the volume.

[New York Tribune.]

The author of this work is well known as a most skillful veter-

inary surgeon. His book is based on the soundest common

sense, and as a hand-book for practical use, we know of nothing

to compare with it. [Yankee Blade.]

We know Dr. Dadd well, and are satisfied that he possesses

most important qualifications for preparing such a book as this.

[New-England Farmer.]

Messrs. Jewett & Co. have just published a very valuable work

by Mr. Dadd, a well-known veterinary surgeon, on the causes,

nature and treatment of disease, and lameness in horses.

[Farmer's Cabinet.]

This is one of the most valuable treatises on the subject ever

published; and no owner of that noblest of the animal race, the

horse, should be without it. Especially should it be in the

hands of every hotel and livery-stable keeper. To many a man

would it be worth hundreds of dollars every year.

[Ind. Democrat, Concord.]

By far the most learned and copious work on the horse and his

diseases we have ever seen.

[N. Y. Evangelist.]

One of the greatest and most commendable qualities of this

work is, it is practical and plain to the comprehension of those

farmers and others for whom it is mainly designed. The course

of treatment favors generally a more salutary and rational sys-

tem of medication than that recommended in any previously ex-

isting works on farriery. No farmer or owner of a horse should

be without this book. Stable-keepers, stage-proprietors and

hackmen we believe would derive profit by having at least one

copy hung up in their stables for use and reference by their

stable men. [Daily News, Philadelphia.]

There is more common sense in this book than any of the kind

we have ever seen, and farmers and owners of horses would find

it a matter of economy to possess themselves of it. It will be of

more service than the counsel of a score of ordinary doctors.

[Albany Courier.]

We deem this decidedly the best and most reliable work on

the "Cause, Nature, and treatment of Disease and Lameness in

Horses," ever published. [Nantucket Inquirer.]

What we have read of this book induces us to regard it as a

very sensible and valuable work; and we learn that those much

more competent to judge of its value, have given it their un-

qualified approval. [Eve. Traveller, Boston.]

This book supplies a great desideratum which Skinner's ad-

mirable treatise on the horse did not fill. Every man may be

his own veterinary surgeon, and with much greater safety to his

noble animal, than by trusting him to the treatment of the em-

pirical itinerants who infest the country. It is well illustrated,

and should be purchased by every man who owns a horse.

[Eve. Mirror, New-York.]

This is a book that should be forthwith put into the hands of

all who own or drive horses, whether for the dray or gig, for the

plow, omnibus or road, for hard service or pleasure.

[McMakin's Courier, Phila.]

A good, clearly-written book, which should be in the hands of

every man who has a horse whose ill's his affection or his purse

make it worth while to cure.

[Bangor Mercury.]

It is a valuable book to those who have the care of horses.

[Hartford Herald.]

This is a scientific, thorough and complete treatise upon the

diseases to which one of the noblest of animals is subject, and

the remedies which they severally require. [Troy Budget.]

He is not worthy to have a horse in his care who will not use

such a work to qualify himself for his duties to this animal.

[Commonwealth, Boston.]

Published by JOHN P. JEWETT & CO., Boston,

JEWETT, PROCTOR & WORTHINGTON,

Cleveland, Ohio.

For sale by all Booksellers. 50-63

HORSE POWERS THRESHERS AND

SEPARATORS.—The Endless Chain or Railway Powers

of our own Manufacture, both single and double-gear, for one

and two horses, which has never been equaled for lightness in

running, strength, durability, and economy. They are univer-

sally approved wherever they have been tried.

2. The Bogardus Power, for one to four horses. These are

compact and wholly of iron, and adapted to all kinds of work.

3. Eddy's Circular Wrought-iron large Cog Wheels, for one

to six horses. A new and favorite power.

4. Trimble's Iron-sweep Power, for one to four horses.

THRESHERS.—Improved Threshers upon the best principles,

threshing clean with great rapidity, without breaking the grain.

One-Horse, Undershot \$25

Two-Horse, do \$30 to \$35

One-Horse, Overshot \$28

Two-Horse, do \$33 to \$38

Separator, which greatly facilitates cleaning the

grain and preparing it for the fanning-mill. \$7 to \$10

All the above-named machines are guaranteed the best in the

United States. R. L. ALLEN, 189 and 191 Water-st.

Special Notices to Subscribers, Correspondents, &c.

SUBSCRIPTIONS can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September, as a half yearly volume of 416 pages, with a complete index, begins on each of those dates.

Those wishing their papers changed from one office to another, should give the name, County, and State, of their old and new Post-office.

Postage is no higher paid at the office of delivery than if paid at the office where mailed, and as the "regulations" at the New York Post-office preclude us from paying by the quarter or year, it is useless for subscribers to send money for the pre-payment of postage, for we can not attend to paying postage fifty-two times a year for each subscriber.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then inclose them in presence of the Postmaster. Give the Post-office, and the County and State. Write these very plainly.

Economical Arrangement to Furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The *American Agriculturist* will be furnished

with Harper's Magazine, one year for	\$4 00

" Dickens's Household Words " " "	3 50
Address	

ALLEN & CO.,
189 Water st., N^W.-York.

PUBLISHERS' ANNOUNCEMENT!

THIRTEENTH VOLUME OF
THE AMERICAN AGRICULTURIST,
THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

The American Agriculturist,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

N. B.—The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume, for the bound work.

COMPREHENSIVE IN ITS CHARACTER.

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the Agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "Farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent Farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor, by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of Agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers *only* that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon *its own merits*; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammeled* by any collateral business-connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great Agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the joint Editorial supervision of Mr. A. B. ALLEN—its principal editor for the first ten years—and Mr. ORANGE JUDD, A. M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical Agriculture, and, in addition to these, number of other eminent Agricultural and Horticultural writers.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and Post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers.....	\$2 00	A YEAR, \$2 00
" Clubs of 3 do.....	1 67	" 5 00
" " 5 do.....	1 60	" 8 00
" " 10 do.....	1 50	" 15 00
" " 20 do.....	1 25	" 25 00

The money always to accompany the names for which the paper is ordered.

The Postmaster, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Postmaster, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, Weekly Tribune, or Weekly Times, or any other paper or periodical in this City, the cost not exceeding two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if inclosed and mailed in the presence of the Postmaster.

Communications for the paper should be addressed to the Editors; Subscriptions, Advertisements, and all matters relating to the business department, should be addressed to the Publishers,

CONCENTRATED FERTILIZERS ON CORN.

We recently reported an experiment with these fertilizers upon grass. A friend has applied them to corn, and put them in competition with stable-manure, sending us the results, in a letter, which was not quite so carefully written as his experiments were conducted. He is a careful and observing cultivator of the soil, and we have entire confidence in the accuracy of his statements. It will be seen that these manures are as good for corn as grass, and that, if one is under the necessity of purchasing, they are much cheaper than stable-manure, at fifty cents per half cord, at the place of delivery. His standard for comparison is stable manure, spread in the field, at one dollar a load, [½ a cord.] His experiments are highly interesting, and will bear study. He writes:

For the full understanding of these experiments, I will state that, the ground selected was sward land, and what I should call a gravelly loam. It was plowed about the 20th of May last, in strips one rod wide, and planted four rows to each breadth, with medium-sized yellow corn.

The stable-manure was taken from a heap outside the barn, made from good hay fed to neat cattle, nearly free from litter, and drawn in a common ox-cart, and spread on the land before plowing.

The manure, from grain fed to swine, was made in a covered pen, with tight plank floor, and soil from the fields used as an absorbent. The bones were dissolved in sulphuric acid, mixed with twice its quantity of water.

I have estimated the yield by husking on the hill, and counting eighty pounds of sound ears a bushel, and have brought both the crops and fertilizers to acres. I used both De Burg's and Mapes's superphosphate of lime, but found so little difference in the effect that I have not encumbered the statement with the amount of each. In order to ascertain the exact value of the fertilizers, or their comparative value, it will be necessary to keep an account of the crops, as long as there is a difference between the manured and unmanured parts of the field.

Every one acquainted with our *hard soil*, knows that, as respects the stable-manure, it would take ten years to exhaust it. After using some thirty tons of guano, during a period of eight years, I am confident that its beneficial effects will be seen on the soil as long as stable-manure. In the following ex-

periments, I think only one half the cost of the fertilizers should be charged to the first crop. I have no doubt that three years' trial will show that this is more than belongs to it. I estimate the value of the stable-manure at one dollar a load spread upon the ground; the superphosphate at 2½ cents a pound; the guano at 2½ cents, and the dissolved bones at 1½ cents a pound; the leached ashes at 6 cents a bushel; the value of the manure, made from a bushel of corn fed to swine, at 15 cents.

I had one strip plowed twice the usual depth, and the consequence was a diminution of the crop one quarter. I do not mention this as an objection to deep plowing. It requires no experiment to show that six inches of good soil is more productive than the same soil mixed with six inches of dead earth. It is equally evident that a soil 12 inches deep, is much more valuable than one 6 inches, of the same composition.

EXPERIMENTS.

No. 1—No manure; yield, 28 bushels.

No. 2—500 pounds of superphosphate of lime; yield, 46 bushels. Increase of crop, 18 bushels. Cost of fertilizer, \$12 50. Increase for each dollar, one bushel and 14 qts.

No. 3—690 pounds of guano; yield 50½ bushels. Cost of fertilizer, \$19. Increase of crop, 22½ bushels. Increase for each dollar, one bushel and 6 quarts.

No. 4—300 pounds of superphosphate and 640 of guano; yield, 58 bushels. Cost of fertilizers, \$25 10. Increased yield, 30 bushels. Increase for each dollar, one bushel and 6½ quarts.

No. 5—320 pounds of guano, mixed with 640 of dissolved bones; yield, 51 bushels. Increased yield, 23 bushels. Cost of fertilizers, \$18 40. Increase per dollar, one bushel and 8 quarts.

No. 6—1,040 pounds of guano and 400 of superphosphate; yield, 74½ bushels. Increase, 46½ bushels. Cost of fertilizers, \$38 60. Increase per dollar, one bushel and 6½ quarts.

No. 7—16 loads of stable-manure; yield, 35½ bushels. Increased yield, 7½ bushels. Cost of manure, \$16. Increase per dollar, 15 quarts.

No. 8—32 loads of stable-manure; yield, 42½ bushels. Increase, 14½ bushels. Cost of fertilizer, \$32. Gain per dollar, 14½ qts.

No. 9—16 loads of stable-manure and 200 bushels of leached ashes; yield, 44 bushels. Increased yield from ashes, 8½ bushels. Cost of ashes \$12. Gain per dollar, 22½ qts.

No. 10—16 loads of stable-manure and 640 pounds of superphosphate; yield, 49½ bushels. Cost of superphosphate, \$16. Gain per dollar for superphosphate, 28 quarts.

No. 11—32 loads of stable-manure, 320 pounds of guano and 320 of superphosphate; yield, 60 bushels. Increase for superphosphate and guano, 17½ bushels. Cost of guano and superphosphate, \$16 80. Gain for each dollar, one bushel and ¾ of a quart.

No. 12—640 pounds of meal fed to swine, equal to 108 bushels of corn; yield 43 bushels. Increase, 15 bushels. Cost of manure, \$16 20. Gain for each dollar, 30 quarts.

We throw these statements into tabular form, for convenience in the comparison.				
No. of Experiment.	Quantity of Fertilizer per acre.	Yield of an acre.	Increase.	Cost of manure.
1	No manure	28	18	\$12 50
2	500 lbs. of superphosphate of lime	46	18	19 00
3	690 lbs. of guano	50½	22½	25 10
4	300 lbs. superphos. and 640 guano	58	30	38 60
5	320 lbs. guano and 640 dissolved bones	51	23	18 40
6	1,040 lbs. guano and 400 superphosphate	74½	46½	38 60
7	16 loads stable-manure	35½	7½	16 00
8	32 loads stable-manure	42½	14½	32 00
9	16 loads stable-manure and 200 bushels leached ashes	44	8½	12 00
10	16 loads stable-manure and 640 superphosphate	49½	13½	16 80
11	32 loads stable-manure and 320 superphosphate	60	17½	16 20
12	Meal from 640 lbs. swine	43	15	16 20
Increase for each dollar, with manure, is given.		Bus. Qts.	Increase of crop for each dollar, with manure.	Bus. Qts.
		1 14	1 14	1 14
		1 06½	1 06½	1 06½
		1 08	1 08	1 08
		1 06½	1 06½	1 06½
		0 15	0 15	0 15
		0 14½	0 14½	0 14½
		0 22½	0 22½	0 22½
		1 00½	1 00½	1 00½
		0 30	0 30	0 30

It is worthy of notice, in this table, that you get your money back again for manure, just as surely, when you apply it in large quantities, as in small. The 16 loads of manure gives you 15 quarts for a dollar, and 32 loads 14½ quarts. In three of the experiments with guano, you get about one bushel and 6 quarts for one dollar. The economy of home-made superphosphate, to be used with guano, is clearly shown.

We are much obliged for these valuable experiments, and hope to hear from this cultivator often.

For the American Agriculturist.

PREPARATION OF SOIL—TRANSPLANTING FRUIT TREES, ETC.

It is a well known fact that the deeper and more thoroughly a soil is pulverized, the better it is for the growth of fruit-trees. It has, doubtless, been observed that where the soil is shallow, the growth of the tree is slow, and, in dry summers, scarcely at all, while that of another standing in deep soil but a few feet distant, is very rapid. What makes this difference? The soil may be no more fertile in the one case than in the other; it may, even in the latter instance, be less fertile. The truth is simply this: in the one case, all the elements are made available, while in the other they are not. It is impossible for the roots to penetrate the hard subsoil, and in these circumstances, we may no more expect a rapid growth, than a rank corn-field on two inch soil.

A thoroughly pulverized soil is just as necessary for fruit trees as for grain; and yet how few carry it out in practice. Nearly all our agricultural journals are replete with instructions on the proper transplanting and culture of trees, and yet how few carry it out in practice. One good example will effect more than volumes written on the subject. A tree properly planted may be made to grow fifteen or twenty feet high in six or eight years, with tops as many feet in diameter, besides yielding a fair crop of fruit; and who would not rather pay eight or ten cents for the trouble, than only two cents and wait twice as long before any fruit could be expected. And yet the latter is too common among farmers. They acknowledge the error, but assign as a reason, that "it is too much work to prepare the soil two feet deep, for every tree." But planting an orchard, it should be remembered, is not a thing of yearly occurrence, and seldom takes place but once in a life time. And this consideration alone, should incite us to do it in the best possible manner. We can not cheat fruit trees, or even slight them, and expect a suitable reward. On the contrary, the reward is usually in proportion to the labor, which, be it little or much, is sure to display itself in one way or another. Deep and thorough preparation of the soil is, therefore, the first step in the cultivation of fruit-trees; and as such an operation requires much hard labor, I propose to show the method which I have employed this fall, in planting about two hundred pear trees.

For two years the soil has been plowed a foot in depth, well manured, and planted with corn. This fall I staked out the ground for the rows, and plowed the land with a Michigan soil plow, about ten feet wide, and 16 inches deep, *actual measurement*. This was done by going twice or thrice in a furrow. When one furrow was completed, I hitched on the subsoil plow and broke up the substratum at least ten inches deeper. A land being thus finished, the dirt was scraped out right and left from the place where the tree was to stand, to the depth of sixteen or eighteen inches. This left a spot about eight feet in diameter, from which the earth was removed down to the unbroken soil, taking care to leave the dirt as near the holes as possible, so as to facilitate the labor of filling them again. Having finished a row of holes, I stir up the subsoil with a spade and pick, ten inches deeper, breaking all the lumps to pieces, and then throw in and mix together about three inches of the surface. I then hitch on the team, and by means of a back furrow, fill the hole about half full of dirt, on which is placed four or five bushels of well prepared compost, from the same yard. The manure is then covered over with dirt, and the tree set on about even with the surface, as the soil prepared in this

way will settle, and bring the trees to the proper depth. Finally the best soil is placed about the roots, and a pile of dirt packed about the trees, so as to keep them erect during the winter. In the spring I shall remove this dirt, and work in a good top dressing of compost about the roots.—Many of my trees, treated in this way, send out branches three and four feet long in a single season. And even the past summer, dry as it has been, some have grown two and three feet, and appeared to suffer but little from the drouth. Many of them, on the other hand, planted after the old style, have grown but a few inches, and some not at all. I have sometimes been ridiculed for being thus particular in preparing the soil; but the best defense I can make is, to show the difference between the result of the two methods.

Ten years ago I transplanted a few trees, when the soil was broken only as deep as we commonly plow; and, although the soil has been well stirred about them each year, still they have grown but little, and have yielded no fruit. This fall I am retransplanting them, as they should be. Where the soil is rather barren, all the subsoil is thrown out of the hole, and a wagon load of alluvial or sods from the highway, is deposited in each hole. Ashes, bones, tan-bark, chip-manure, saw-dust, and all such materials, are well mingled with the soil about each tree. On my hard, compact land, I think as much of corn-cobs, and tan-bark, as of any other kind of manure. My ashes, instead of being deposited in the ashery for a year, or sold for a few cents per bushel, are immediately scattered around the fruit trees, and they return me, in fine fruit and healthy trees, double what they come to in dollars and cents. One word more by way of obviating the objection against transplanting trees in this manner in the spring, because it interferes too much with the ordinary business of the farm.

Let the ground or holes be prepared in the fall, or even in the winter, and then it will consume but little time in the spring to put out the trees. I am preparing the holes this fall for several hundred trees; and, if the ground is not frozen, I intend to work at them during the winter. I throw out all the subsoil, to the depth of two feet, and eight feet in diameter, and let the frost and rain act upon it; and by the time the season for transplanting arrives, this dirt soil will be as fine as ashes.

Whether this will pay, is a question often asked me. Were I not assured that labor and money, thus invested, is not far better than cash at twelve per cent interest, I should abandon the operation at once.

LAKE RIDGE, N. Y.

S. EDWARDS TODD.

COVERING FOR FRAMES.—I notice that some of your correspondents are desirous of ascertaining what will make a good substitute for matting or other extensive materials for covering frames and pits. The general faults with all substitutes recommended are, weight, clumsiness, and their easy destruction. I beg to suggest the use of galvanized iron netting, and straw; the straw being placed between two pieces of netting, as thickly as desired, and the whole united at different points by wire, both to keep an uniform flat surface, and to prevent the straw escaping at the edges. A stout lath might be fastened at each end, whereby strength and a better holding upon removal would be gained. The iron wire is advertised at a low price, and most folks can find some spare straw.

SOUTHSEA, Hants, Oct. 21.

C. F. PALMER.

THE difference between a carriage-horse and a carriage-wheel is this, one goes best when tired, and the other don't.

FOREST TREES.

At a recent sitting of the French Academy of Sciences, held in the city of Paris, M. Chevaudier developed a portion of the results of five years' study and experiments upon the *manuring of forests*, and the augmentation of their annual yield. This question has an interest in France which can hardly be understood in America, where the difficulty is rather to clear the ground of its woody growth, than to stimulate it to greater fruitfulness. M. Chevaudier commenced his experiments in 1847, believing it as possible to assist trees in their growth as flowers, grass and animal plants. Why could not art interfere to restore to the soil the mineral substances withdrawn from it by the roots of the trees, and by them conveyed to their trunks and branches? Because woods spring up of themselves, and appear to flourish without the aid of man, was it not nevertheless probable that a system of amelioration of the soil might urge them to a more luxuriant vegetation? The great difficulty in the way of such attempts was the length of time necessary to devote to them. When Franklin wished to convince his fellow-citizens of the good effects of plaster of Paris upon a soil deficient in lime, he simply sprinkled, in the midst of a meadow, a quantity of powdered plaster, tracing several words in huge letters. A few weeks afterward the lime had sunk into the soil, but the words traced upon the meadow stood out from the rest by the richer color and the double height of the vegetation. But in order to convince one's self in sylviculture, that such or such a manure or substance acts favorably or otherwise, study for whole years, and application of the system to a very large extent of land, were indispensable. After five years' steady devotion to this specially, M. Chevaudier communicated the substance of his discoveries to the Academy. He commenced his experiments by choosing, among the substances that their cheapness rendered accessible, such as could restore to the soil the elements of the azote or salt withdrawn from it for the support of the forest. As sources of azote, he employed the salts of ammonium; as sources of mineral substances, he used wood ashes, which contain the whole mineral portion of the wood before its combustion. He also tried lime, the salts of potash and of soda, the phosphate of bone lime, plaster, and the sulphate of iron; and earthy substances, the residue of factories, or salts of potash and soda, (*oxy-sulphuret calcium*), which had already been, and with advantage, tried in the valleys of the Vosges. It would be impossible to transcribe the tabular view drawn up by M. Chevaudier, which gives the individual history and the bill of health of five thousand five hundred and thirty subjects—pines, cedars, oaks, beeches, larches, etc., etc. I have only room for the general conclusions, which may be divided into four categories: 1st. Substances whose fertilizing action was more or less marked. These were, the oxy-sulphuret of calcium, the chlorhydrate of ammonia, plaster of Paris, wood-ashes, sulphate of ammonia, lime, non-calced bones and poudrette. 2d. Substances whose fertilizing effect was slightly marked or doubtful. These were, the carbonate of potash, coagulated blood, calcined bones, an equal mixture of nitrate of potash, non-calced bones, sulphate of iron and carbonate of lime, and an equal mixture of nitrate of potash and non-calced bones. 3d. Substances which seemed to have no effect at all—the carbonate of soda, the nitrate of potash and sea salt. 4th. Substances which seemed to have had an injurious effect—the sulphate of iron, and equal mixtures of sulphate of iron with lime. The residuum of soda and potash works, known by the name

of the oxy-sulphuret of calcium, generally supposed to be utterly useless, has been proved, by M. Chevaudier's experiments, to be the most wonderful substance ever employed for fertilizing purposes. It augments the growth of forests over one hundred per cent. In the neighborhood of soda-works, there are huge piles of it, the accumulation of years. At Marseilles it is thrown into the sea, while there are, throughout the department, vast pine plantations upon which it might be applied with great advantage.

Home Journal.

THE BEST METHOD OF STORING AND PRESERVING POTATOES DURING THE WINTER.

At the Whitby Farmers' Club, Charles Hudson, Esq., in the Chair, the following most valuable remarks were made in the course of a short discussion on the above subject:

W. Frankland, Esq., said he considered that very much depends on the state the potatoes are in when taken up. As regards his own, this year, they had been partially attacked with the disease, and he thought at one time they were going to be very bad; but they have turned out much better than he expected. Those diseased he sorts out as he takes them up. He then thinly spreads the good in his out-houses, when they are taken up wet; but this year they are so dry and clear that he has laid them much thicker. He lets them lie ten days or a fortnight to sweat, and then sorts them into three sorts, marketable, for sets, and the bad and small for pigs, &c. In about another fortnight he stores them in pies in the field, as by keeping in the house all the winter they are apt to shrivel, and do not look so blooming in the spring.

Mr. Geo. Welburn, of Fylingdales, said that he sorts his in the same way as Mr. Frankland, and spreads them accordingly; he has an out-house on purpose for storing them for the winter, and therefore never makes pies in the field. As soon as he thinks they are fit to put by, he stores them in his potato-house, and covers them with straw and dry sods. He takes particular care of his sods from year to year, always preserving them from wet. By these means, living as he does near the fishing town of Robin Hood's Bay, which he supplies all the winter, he can get easily at them at all times, whether frost or snow, which he could not were they in pies in the fields.

Mr. T. Ward, of Bannial Flat, said he does the same as Mr. Frankland as far as he has room in his out-houses; but as he grows a large quantity he can not take, perhaps, such minute pains and care of them. He causes them all to be sorted as they take them up, and leaves all the diseased and bad ones on the land, and then turns his pigs in to consume them. He first puts the good in small heaps in a field, and covers them with straw, and lets them lie in this way about a fortnight to sweat; he then has them properly sorted, and stores them in pies in the fields for the winter. He thinks Mr. Welburn's plan a good one, where there is a proper storing house.

Mr. E. Ormeston, of Struggleton, said that he puts all his potatoes in the house the same as Mr. Welburn. He is very particular in sorting them, as he believes that the diseased potatoes infect the good; but in a few weeks after they have been taken up and sweated, they may then be stored for the winter, he having houses for the purpose.

All the other members present concurred in the opinion that potatoes must be allowed time to sweat before they are stored away for the winter, and the diseased regularly

sorted from the good, as there is no doubt of the disease being contagious.

Mark Lane Express.

RAILWAYS AND AGRICULTURE.

WE have received a well printed pamphlet of forty pages, containing the address of Hon. Kenneth Rayner, before the North Carolina Agricultural Society, at the recent annual show. From many interesting passages we select the following:

One of the most striking manifestations of the industrial enterprize of the age is the struggle man is now engaged in, with the obstacles presented by nature—in opening channels of communication, in laying down the pathways of trade and commerce, in pioneering the way for the iron rail and steam-engine. The vast stores of the Incas of Peru dwindled into insignificance compared with the hundred of millions that have been expended in these monuments of human industry in the United States, in England, in France; and their march is onward toward the steppes of Asia. In their construction man has achieved victories over the elements, of which Archimides never dreamt. It was the boast of Napoleon, that while Hannibal had scaled the Alps, he had turned them—but the engineer has done more than either of these great conquerors; he has tunneled them—not for the march of desolating armies, but for the transit of the products of the pursuits of peace—for the conveyance of the traveler in comfort and safety, beneath the roaring avalanche above his head. And what are railroads, but the veins and arteries through which the products of agriculture, either in their crude state or as fashioned in the workshop, circulate, in seeking the markets of commerce. While railroads are dependent upon the products of agriculture, yet the two are inseparably identified in interest. They act and react on each other. It is upon the productions of the field and the workshop the railroad must rely for the materials of freight, the very means of subsistence. But then again, the construction of the railroad, by the benefits conferred, in contiguity to market, chapening the cost of transportation, increased convenience in procuring the comforts and luxuries of life, affords a stimulus to the land-owner to improve his land to the highest capability of production; and as the products of the land are increased, the railroad finds increased employment, and enhanced profits. This is no mere theory. Experience has every where proven it to be true. It is a mistake then to suppose—a mistake in which the farmers of South Carolina indulged in for many years, to an almost fatal extent—that it is the speculator and the capitalist, who are principally interested in the construction of railroads and the advancement of internal improvement. Until within a very few years, the farmers of this State supposed, and demagogues found it to their interest to foster the delusion, that the only interest the farmer had in works of internal improvement, was the interest on the State debt caused by their construction. But the diffusion of intelligence, and the teachings of experience, have proven that productive labor, after supplying the producer's immediate wants, are valueless without markets in which to sell; and that markets are valueless without the means of reaching them.

If any young man wants to reach the "high top gallant mast of felicity," let him make a journey through Maine, sitting on the back seat of a stage coach between two down east girls, with only one piece of spruce gum for the three to chew. The editor of the Boston Herald has tried it.

DISEASES OF FOWLS.

A CHAPTER ON ROUP.

I think it due, not only to the author of a paper which appeared in your Chronicle some time ago, on "The American cure for roup," but also to poultry fanciers in general, that I should inform you of the result of several experiments I have made lately in the treatment of that infectious and hitherto fatal malady.

In the early part of last spring, roup appeared in my yard, attacking first my game fowls, (which inhabit a building at some distance from the other poultry,) and soon running through the whole flock, which have continued to manifest more or less of its symptoms ever since.

In their treatment, I gave a very fair trial to every remedy that has, as far as I know, been yet suggested—from the old "cock-feeders'" mixture of rue, garlic, and butter, to calomel, blue pill, jalap, pepper, &c., &c., with various other compounds of my own suggestion, both for external and internal application. These several modes of treatment, many of them based on scientific principles, appeared, however, of little use in stopping short the disease, although I ultimately lost but one bird; and I was beginning to think that this malady was one which would run a certain course, in spite of every precaution and remedy. When I first read the article I have already alluded to, in the Poultry Chronicle, I tried the simple remedy there suggested, viz: a saturated solution of alum, a dessert-spoonful of which I gave, internally, twice a day, injecting about a tea-spoonful into the nostrils each time by a glass syringe.

In every instance, thus far, it has never failed to effect a cure in from twenty-four hours to three days, according to the stage of the disorder, and the symptoms manifested.

I have given it to birds so swollen in the face, that they could hardly see; to others rattling in the throat; to some with the clear, watery discharge from the nostrils; to others with the purulent discharge of a more advanced stage, and that with the most signal success in every instance.

Yet, I do not wish to infer that this preparation must necessarily be efficacious in every instance; nay, I still think that if allowed to run on too long, and prey too far upon the constitution, roup will be found very difficult to cure.

I must acknowledge at the same time that, in my opinion, this remedy is far more certain if applied in the earlier stages, when its astringent effect upon the inflamed mucous membrane lining the cavities of the nose and fauces, are most important and beneficial.

I fear that I have already trespassed too far upon your time and patience, yet, if they can be of any service to you, permit me to add a few remarks upon roup in general, some of which may be new, and some merely backing out the theories and suggestions of others.

How seldom we see roup manifested in the farm-yard, where the poultry are too often little cared for, and are permitted to roost in any out-house, no matter how much exposed and filthy. Yet, how is it that we find fowls, perhaps of the same breed, indulged in every way, both as to diet and housing, suffering so severely from this disorder? Is not this, to a certain extent, the very reason?

The birds are brought to an artificial state of growth and system by high feeding. They are secured for the night in a building at all times rendered close by their own breath, and the exhalations of their own bodies, and in addition to this, sometimes warmed by pipes of hot water, or a gas apparatus.

Relaxed and heated by such a process, they leave their roosting-place at early dawn, (for no artificial treatment can change this natural instinct,) and at once begin breathing a totally different atmosphere, sometimes damp, sometimes frosty, and at all times chill.

Such sudden changes must, and do influence them most prejudicially, sowing the seeds of catarrh, roup, inflammation of the lungs, and consumption. Catarrh in fowls, I am convinced, is merely a premonitory symptom of roup, and if checked early, and properly treated, viz., by removing the bird affected to a dry and moderately warm house, allowing it a pretty generous diet, and giving a few grains of rhubarb and blue pill, will soon pass off, and leave behind no evil effects.

But, on the other hand, if neglected, will run on, and become an established roup; and once let this disorder enter the yard, there is no knowledge when its deadly infection may disappear.

I fancied that I had quite got rid of it by the cure of my fowls, by having my houses thoroughly lime-washed out, and thrown open to the air for a week, and also by having provided new vessels for the fowls to drink out of. But on turning some fresh poultry into the yard, I found that before they had been there two days they were as bad as the others had formerly been, although not one of the old stock remained in the yard.

I believe roup to be a disease intermediate between the influenza in man, and the glanders in the horse, and proportionately fatal accordingly as it approaches in symptoms one or the other of these diseases.

It may be brought on primarily by suffering a catarrh to be neglected, by the breathing of an infected atmosphere, or by a healthy bird drinking from the same vessel in which infected birds are in the habit of drinking; for when a fowl thus affected, drinks, the discharge from the nostril is apt to run into the water, thus tainting it, and so rendering it highly infectious for other fowls.

Poultry Chronicle.

W. W. B.

STALE BREAD.—M. Boussingault, the great chemist, says that the common belief of the cause of the conversion of new into stale bread is, that it gets dry, or, in other words, that it loses water. He, however, took a loaf weighing 8 lbs., out of the oven, being then, in its interior, at a temperature of about 207 degrees. This loaf he suspended in a room of 61 to 66 degrees, and the loss of heat carefully noted. After 25 hours, the temperature of the bread had sunk to that of the room, and the loaf had lost 0.008 per cent. of its weight—water of course. It was now half stale, and the crust no longer hard. At the end of the sixth day, the bread was thoroughly stale, although it had lost only one ten-thousandth of its weight by drying. Boussingault, therefore, regards staleness in bread as due to a gradual change in its molecular condition, and not to a loss of water.

CORN CAKE.—A special premium was awarded to Mr. Charles W. Wampole, at the late fair of the Montgomery County Agricultural Society, for a corn cake, made after the following recipe:

"Take the whites of eight eggs; one-fourth pound each of corn starch, flour and butter; half pound sugar; one tea-spoonful of cream of tartar; half tea-spoonful of soda. Flavor with almond to suit the taste."

Why are country girls' cheeks like French calicoes? Because they are warranted to wash and retain their color.

SONG OF THE FARMER.

BY THE "PEASANT BARD."

GIVE to the lord his palace grand,
And halls of splendid pride;
A fig for all his dignities,
And all his pomp beside!
Give me the FARMER's peaceful home,
Beneath the maples high,
Where Nature's warblers wake the song,
The waters prattling nigh.

The citizen may love the town,
And Fashion's gaudy show;
The brilliant pageantry of Art
May please the eye, I know;
But Nature's charms delight the heart,
All simple though they be;
The acres broad, the streamy vales,
The lowing herds for me!

What though the bronze is on our cheek,
Toil calloused in our hand,
With honest pride we stand erect,
The nobles of the land;
For "patriot Truth," that spirit bright,
In this wide world so rare,
Points proudly to the Farmer's home,
And cries—"My own are there!"

CHORUS:

Then here's to him who tills the soil,
The true, the strong, the brave!
Without him Art would fly the land,
And Commerce leave the wave;
And yet no frown of hauteur cold
Distinguishes his manly brow;—
Hail to the FARMER! thrice all hail!
Lord of the mighty Plow!

MUSKETOES AND WORSE INSECTS.

STILL unable to find my authority for the "sawdust of juniper wood," the artemisia, recommended by Dr. Hooker, and the rue, by another correspondent, have frequently occurred to me as remedies for another pest still more complained of by travelers. It is an old saying that neither fleas nor bugs will bite where there is a sprig of wormwood or rue in the bed; and, although these herbs may not be procurable when most wanted, they both furnish a powerful essential oil, of which a half pint (or smaller) bottle, wrapped round with a yard or so of folded muslin, and packed in a tin box, might form a part of the traveler's equipage. Opening this box, putting a few drops of the oil in the muslin, and squeezing it well to diffuse the oil all through it, and spreading this cloth between the sheets an hour before going to bed, the insects might be effectually quieted, if not expelled, so long as the odor remains, which would be the whole night. The same cloth would serve repeatedly, and form a safe package for the bottle. But another essential oil, having an odor like juniper mixed with wormwood, but more powerful—that of turpentine, may be obtained almost wherever paint is used, is very cheap, and known to be extremely repugnant to bugs, and therefore, probably, to fleas. This may be used in the same manner, and may procure the traveler a good night's rest, when he otherwise would be driven from his couch.

J. PRIDEAUX.
Gardiner's Chronicle.

TREES.—The Humboldt California Times mentions a spruce pine log, 26 feet long, which turned out 1,000 feet clear stuff, without knots or windshakes. The tree made 13,000 feet clear lumber. We don't believe it can be beat in the country, though we have trees of other species much larger—for instance, the red wood—that are estimated to turn out upward of 100,000 feet. That one tree will build two houses, each two stories high and 50 feet square, furnishing all the square timber, planks, shingles, &c., would not be credited in the Atlantic States.

THOUGHTS OF AN OLD SMOKER.

THE National Magazine for November contains the following article on tobacco smoke, to our mind, one of the most interesting discussions of its merits and demerits, that has appeared among all the tracts and treatises on the subject the last ten years have seen. Do not pass it by, smokers, for you can testify of its verity; and ye who do not smoke, read it that you may not.

A quarter of a century ago, I began to master two difficult attainments; I learned to shave and I learned to smoke. Of these two attainments, smoking was incomparably the hardest; but I managed it. What has it cost me? I have smoked all sorts of tobacco, and, as I suppose, in almost all forms. I began with cigarettes, advanced onward to cigars, then to Maryland tobacco, then to returns, then to bird's-eye, and thence to the strongest shag. I have bought and smoked cigars at all prices, and of all manufactures, from the suspicious articles, six of which may be bought for sixpence, and which probably are innocent of any connexion with nicotiana, save a slight tinge with its juice, to the costliest Havana. I have been fanciful in cigar tubes, and also in pipes, though to no alarming extent, having never paid more than a dollar and a half for a tube, and a dollar and a quarter for a meerschaum; and, after all attempts to be fine, preferring the naked cigar, or the half yard of clay. I have spent money, too, on instantaneous lights of many sorts. When phosphorus boxes, containing a small bottle of fiery mixture, and about a score of matches, cost seventy-five cents each, I gave that for one. When lucifer matches were invented, and sold for twelve cents a box—less in quantity than may now be bought for a cent—I patronized the manufacture. I have used German tinder, fusees, and a dozen other kindred inventions; and all these, costing money, have served me only for the lighting of my pipes or cigars.

Looking at it then, altogether, and taking into account cigar-cases, cigar tubes, tobacco, pipes, and matches; considering, too, that I have been a constant and persevering, though not an enormous smoker, I may safely and fairly conclude that, take one time with another, smoking has cost me half a dollar a week for twenty-five years.

A half a dollar a week; that is to say, twenty-six dollars a year; making for the whole period, and without reckoning interest, either compound or simple, the sum of six hundred and fifty dollars. Now, this I repeat, is keeping within compass; and a friend at my side tells me that double the amount a week would be nearer the mark; but as, during ten years past, I have not exceeded the more moderate computation, I shall let it remain.

Six hundred and fifty dollars—setting aside the consideration of interest—is a large sum. If, twenty-five years ago, instead of a tobacco-box I had set up a money box, and dropped into it a weekly half dollar, I can not avoid the conclusion that I should be now six hundred and fifty dollars richer than I am; and there are many things I could do with six hundred and fifty dollars. It might serve me for a year's housekeeping, for my establishment is on a humble scale; or it might set up my eldest boy; or it might furnish my house. Or, if the half dollar week had been devoted to a life insurance, and I were to die to-morrow, my family would be the better for my self-denial by one thousand five hundred dollars. Or if I had spent half a dollar a week on literature, my library would now be, and much to my advantage, larger than it is. Or if, laying aside selfish considerations, I had set apart the half dollar a

week to works of charity and mercy, the world might have been the better for it. Many a heart-ache might have been relieved by the six hundred and fifty dollars which I have puffed away. I think, then, that if I had to begin life again, I would not learn to smoke.

I know it may be said that the same arguments could be raised against this, that, and the other superfluity, which might be done without. But I am not writing about this, that, and the other superfluity; I am writing about tobacco-smoke.

To turn to another thought; I am not quite sure that smoking is a healthy practice. I know it is not necessary to health, for I see my friends who do not smoke are not troubled with diseases to which those of us who do are subject. My wife does not smoke, and, so far as I can see, she does not suffer from the privation. I might go a step further, and say, I have a strong suspicion that sometimes smoking disagrees with some of us, and is rather detrimental to health than otherwise. Certainly, excessive smoking is injurious; but who shall draw the line of demarcation between moderation and excess? As for myself, I do not know that smoking has ever hurt me. It is true, when I have a bilious head-ache, I nauseate the smell of tobacco-smoke, but so do I nauseate also the smell of roast-beef. Still, as I firmly believe that I am none the better for smoking, I think, if young again, I would not learn to smoke.

Then, again, I can not help the conviction that smoking is rather the reverse of a sweet and cleanly practice. To be sure, my friends praise me for not betraying my habit; nevertheless, there are times when I am glad to rinse my mouth, and purify my garments, and fear that, after all, I carry about with me unmistakable tokens of what I have been doing. And I am quite sure that some of my smoking friends, who are less particular than I am, and especially those who cultivate dirty German pipes, are never free from the peculiar perfumery of stale tobacco. And as this is far from being pleasant to me, who am a smoker, I am sure it can not be pleasant to those who are not smokers. Moreover, the expectation which smoking provokes is far from a pleasant or cleanly habit. On these accounts, then, had I to pass through life again, I think I would determine to pass through it without learning to smoke.

Again, I think that smoking does not add to a man's respectability. I am not sure that it has not, sometimes, a contrary tendency. This may depend on circumstances. Certainly, some men of the highest respectability do not think it any derogation to be seen at times inhaling the vapor of a cigar or a pipe; but no one can say that they would not be equally respectable were they known to avoid smoking as an evil thing. Whereas, on the other hand, some have notoriously lost caste by being numbered among the smokers; and, in fact, I am reluctantly compelled to admit, if a smoker be reckoned a respectable man, it is in spite of his habit, and not because of it.

Once more, it is not to be denied that a good many people in the world are so fastidious and weak, some smokers say, as to think smoking a disagreeable habit. They do not willingly admit a smoker into their houses, because they dislike his accompaniments. Well, say that it is fastidiousness, and affectation, and "all nonsense"—though, friend and fellow-smoker, we have no right to say that—but suppose it be, the effect is the same; our practice makes us disagreeable, causes us to be shunned, and sometimes, if we don't take care, to be shut out from good society.

True, so far as I am concerned, I avoid this evil—the chance of being disagreeable, or

thrust out from good society—by never smoking except where smoke is welcome. But it is not pleasant, at times, to be debarred a favorite resource for passing time. There is a little bit of self-denial required, I think, when a man would, but dare not put a pipe in his mouth. And as, more or less often, such sacrifices must be made by the smoker who has consideration for others as well as for himself, or who has indeed due consideration for himself, I would, I think, if my youth could be renewed, avoid the need for this self-denial by not learning to smoke.

I think, moreover, that smoking is not one of the things which help to push a man onward in the world; and I am mistaken if, sometimes, the habit is not like a clog to keep him back. I am very sure that a young man, for instance, is not more likely to obtain a situation of responsibility and trust because he knows how to handle a cigar in an elegant manner, or is refined in his appreciation of the best ooonoke; I have a strong impression, on the contrary, that such a one would prefer keeping this acquirement in the back-ground. In other words, I can not but be persuaded that—all things else being equal—the man who does not smoke has a better chance of success in the world than the man who does; and as, if I were young again, I should wish to succeed, if possible, I think I would not learn to smoke.

And I do not wonder that men of business, and employers generally, look with suspicion upon tobacco-smokers; for though a youth or a man, in spite of this practice, may be a valuable workman, it is not to be denied that the smoker at times lays himself open to temptations, strongly tugging at him, to draw him aside from integrity and honor. It is not every smoker that can puff away at a *dry pipe*; and the youth who, to be manly, puts himself to the discomfort of learning to smoke, is likely also, with the same object in view, to learn to tittle. In short, I fear it would be found, if curiously and strictly sought into, that smoking often leads to sottishness. I fear also that, as with every other needless expense, it leads sometimes to dishonesty. It is not always that a youth or a man can afford to dissipate twenty-five cents a week, nor twelve cents either, in smoke. But a dollar a week would not suffice for the vespertine or nocturnal cigar and glass of many a "fast" youth of the present day. Where do they get their quarters?

Well, I never spent more than I thought I could honestly afford on smoke (perhaps they do not either), and I never needed to wet my pipe; but because of the temptations which beset the smoker, I think, could I go back again to the morning of life, I would not learn to smoke.

Again, I do not think that smoking is generally necessary as an aid to mental exertion, or an incentive to profound study. I can not subscribe to the motto, "*Ex fumo dare lucem*;" that is to say, so far as tobacco smoke is concerned. There have been philosophers, poets, statesmen and divines, among the smokers; so have there been among the non-smokers. And I am compelled to conclude that wisdom does not coyly clothe itself in vapor. On the contrary, I am bound to acknowledge my reluctant belief that if the tobacco-pipe is sometimes a help-meet to the pen, it quite as often happens that the pen is the bond servant of the pipe. Therefore, were I to begin the world again, I think I would not learn to smoke.

I think, lastly that it is very disgusting to see beardless youths, and boys just entering their teens, puffing and spitting in the public streets. It was but an evening or two ago that I met a little manikin, about four feet in height, and probably twelve years of age, with a face as smooth as a girl's, sucking furiously at a dirty mereschau nearly as

long as his arm, till the ashes in the bowl glowed with a burning heat. And the most charitable wish I could frame for the poor misguided lad was, that before he got to the bottom of his pipe, he might be desperately sick.

Seriously, I have observed so many mischiefs connected with smoking—have known so many shipwrecks made by it, ay, even of faith and good conscience—have seen so much time wasted, so much money, too, and so much health—and have witnessed so much deterioration of character in some who have given themselves up to the practice, to be led captive by it at its will—that though I may have escaped, by God's help, its worst evils, yet if I had to begin life again, I would not—I think I would not—learn to smoke.

CORN HOEING AND TOP DRESSING.

In looking over the mode of cultivation practised by those most successful in growing the corn crop, and especially the statements of those who have taken premiums for large products of this cereal, we almost invariably find that clean culture and top-dressing were practiced. The corn was hoed at an early stage in its growth, after first going through it several times with the cultivator so as to mellow the soil as far as possible; and then to each hill some stimulant was given, such as plaster, ashes, (leached or unleached), or a mixture of the two. In a few weeks the cultivator and hoe were used again, and the stalks thinned to four in the hill; nor did this suffice, for if time allowed, before the corn became too large to admit of the passage of the horse, the cultivator was again employed, and another dressing with the hoe given. At this stage in its growth the ground becomes so shaded by the luxuriant leaves of the grain that little further attention is needed.

Experience confirms what reason teaches, that large crops of corn can only be grown on rich and well cultivated soils. The structure and size, and the rapid growth of the plant, show that it requires to be well supplied with the necessary food for its growth and perfection. It possesses the power of elaborating healthy aliment from coarser food than almost any other cultivated plant; hence its great value as a preparatory crop when such manures are used. It draws largely upon the air, and hence needs that its large leaves be kept healthy and fresh, not parched and rolled by drouth or discolored by the presence of stagnant water in the soil.

Plow deep, manure freely, plant early, hoe and top-dress with ashes or plaster, keep the soil mellow and flat, and allow no weeds to grow, and your corn crop will repay well all your care and attention. Neglect it, and "nubbins" will be your reward.

Rural New-Yorker.

PACIFIC MILL AT LAWRENCE.—The largest and most comprehensive mill in the world is the Pacific at Lawrence. The floor surface of this immense structure is *sixteen acres*—the largest mill in England is eleven and a half acres. There are now in operation 40,000 cotton spindles and 10,000 worsted spindles; and these are to be increased to 80,000 and 20,000 respectively. There are 1,200 looms in operation, to be increased to 2,400. These, with 2,000 hands, produce 300,000 pieces of cloth per annum, one-half delaines. The weekly consumption of cotton is 20,000 lbs., say 1,500,000 per annum, and 500,000 lbs. wool. Once a month the two thousand hands assemble at the cashier's office, where Mr. Clapp pays out \$500,000 to them for wages, appropriating to each one the exact amount she has earned.

Lowell Courier.

Franconia. On the same plot are 5 hills New-Rochelle blackberries, and one hill of white blackberries; one large pink peony on the north-east corner, and 4 sage roots. During the past season there have been raised on this plot 8 dwarf pear trees from the bud; 10 hills early nutmeg potatoes; 3 hills crook-neck bush squashes; 2 hills of corn; 13 cabbages; some parsley roots, and over eight quarts of very fine strawberries. The strawberries are grown between the white and red Antwerp raspberries.

On the plot I, beside the trees indicated by the figures, and described below, there are 8 currant bushes; 8 gooseberry bushes, of a large green variety, name unknown; one climbing rose, near 40; one white fragrant peony, near 54; one wormwood plant, near 41; one yellow rose; one garden Isup-plant, as it is called; and 7 flower roots of various sorts. During the past season there have been raised on this plot 30 gooseberry plants, from cuttings; 29 Angers quince stocks, which are now budded with a variety of pears; 6 two-year old dwarf pears, to be removed; one row, across the plot north and south, of early beets; three rows of early radishes; two rows of bush beans; one bed of early beets, which furnished more than was used by the family; 8 cabbages; 4 dahlias; and lettuce in abundance. Two crops of radishes were grown round the edge of the beet bed. Mr. S. says he generally plants radishes around the beds of beets, onions, &c., as they are soon grown and out of the way.

The plot J, beside the trees indicated and 7 flower roots and 6 dahlias, has produced, the last season, 2 beds of onions with radishes; 2 beds of early peas; 2 rows of early nutmeg potatoes, in drills; one bed of late beets, for winter use, and 30 late cabbages. The ground occupied with early peas and potatoes was afterward sown with Russia turnips, which did not do well on account of the drouth.

The plot K, was planted with bush beans, potatoes, and some winter squashes.

The plot L, L, beside the trees, is chiefly devoted to vegetables. There are 4 blackberry bushes, and a row of flowering plants along the walk Q from the house to the privy; R. On the plot L, L, there have been cultivated the past season, early cucumbers, potatoes, sweet and chicken corn, bush beans, Lima beans, a bed of peas, gherkins and late cucumbers, for pickling; nasturtions, and some winter pumpkins among the corn and potatoes.

N, is a cold-grapery, 14 by 32 feet, containing a cistern, a simple force-pump, and 25 grape vines, of the following 13 varieties, viz: eight Black Hamburgs; three White Muscats of Alexandria; two Royal Muscadine; two Grizzly Froignan; two Chasselas de Paris; one Chasselas de Fontainebleau; one Red Chasselas; one Black Prince; one Black St. Peters; one Zinfandel; one White Froignan; one Dé Candolle; one golden Chasselas. Ten of these are planted in front; ten against the back wall; three at one end, and two at the other, the pump occupying the place of one vine.

M, is a grape border, 18 by 32 feet. Around the edge of this there has been raised, the past season, melons, winter squashes, and large peppers, for pickling green. The roots of the front vines in the cold grapery spread out under the sill into the border.

O, is a raspberry border, by the side of the fence. Mr. S. says the vines should have been placed far enough from the fence to admit a walk.

EXPLANATION OF THE FIGURES.

Where there is more than one tree of the same kind and variety, the figure indicating its location is repeated. 1, horse-chestnut; 2, dogwoods; 3, elms; 4, English mountain-ash; 5, cherry trees, of the following seven varieties, viz: one each of Mammoth, Yellow Spanish, Coe's Transparent, White-Heart, Honey Heart; two Black Tartarian; and a Black Mazzard to be grafted with the May Duke.

6, common red cherries; 7, dwarf May Duke cherry; 8, dwarf apples—fall pippins, and Wagoner; 9, Norway spruce; 10, balsam firs; 11, white pine; 12, fir tree; 13, Denny plums; 14, imperial gages; 15, green gages; 16, Seckle standard pear; 17, standard pears, grafted with Lawrence and Beurre Clairgeau; 18, standard pears, grafted with Bartlett and early bell; 19, peaches of the following varieties: two each of Morris White, Snow peach, Crawford's late Melocoton, Yellow Melocoton, Yellow Rarripe, and Darien peach; and one each of Nutmeg, Magistrate, Druid Hill, Heath Clingstone, Old Mixon freestone. There are nine trees of natural fruit and some budded ones, but names unknown.

20, Dix pear, standard; 21, apricots of two varieties, viz: Moorpark and Dubois's Early Golden.

22, plum tree, name unknown; 23, red Siberian crab apple; 24, snowball bush; 25, Isabella grape vine; 26, Catawba grape vine; 27, Coe's golden drop plums; 28, Chinese sand pear, standard; 29, apple trees, of the following three varieties, viz: fall pippins, Newtown pippins, and Esopus Spitzenburg. 30, quince tree. The following pear trees, from 31 to 69 are all dwarf pears: 31, Flemish beauty; 32, Bartlett; 33, Josephine d'Malines; 34, Soldat Laborer; 35, Glout Morceau; 36, Beurre Easter; 37, five varieties, names unknown; 38, Columbia; 39, Vicar of Winkfield; 40, Seckel; 41, Louise Bonne de Jersey; 42, Duchesse d'Angoulême; 43, Madeleine; 44, Beurre d'Arenberg; 45, Lawrence; 46, Caillac; 47, Bonne des Zees; 48, Swan's orange; 49, Beurre Brown; 50, Passe Colmar; 51, Doyenne gris; 52, Napoleon; 53, Beurre Diel; 54, white Doyenne; 55, Beurre Clairgeau; 56, Urbaniste; 57, Doyenne Boussock; 58, Bezi d'Esperin; 59, Beurre d'Amanlis; 60, Winter Nelis; 61, Beurre Langelier; 62, Brande's St. Germain; 63, Bell Lucrative; 64, Van Mons Leon le Clerc; 65, Beurre d'Anjou; 66, Golden Beurre of Bilbao; 67, Jaminette; 68, Doyenne d'hiver nouveau or d'Alencon; 69, Buffum; 70, Bartlett standard. [No. 70 is omitted by the engraver; it is west of No. 38, in the center of the square formed by the 4 numbers 19.]

71, hop vine; 72, rhubarb, two varieties—one Victoria and the other unknown; 73, Concord grape; 74, Charter Oak grape; 75, tanzey; 76, red raspberries; 77, black raspberries; 78, (omitted by engraver—should be in the dotted line crossing the upper part of G and J.) currant bushes—Victoria, white and red Dutch; 79, rose of Sharon; 80, climbing roses, of the following six varieties: Double Red Michigan, Baltimore Belle, Mohican, Noisette, Solfaterre, and William Jesse.

81, lilac; 82, boxwood; 83, rose bushes; 84, tea plant. The rest of the borders, C, C, C, C, contain a variety of shrubs, among which are the following: two flowering almonds; three Corchoruses; two snowberries; two sweet-scented shrubs; one flowering currant; one barberry; one yellow rose; one moss rose; three Burgundy roses; three damask roses; one Marquis Bocella; one Dubourg; one Mrs. Bosauquet; one Reine de Fontenay; one Agrippina; one Elegans; one Fabvier; and several others, names unknown. In the borders, also, are peonies, pinks, tulips, daffodils, primroses, lilies, gladioles, dahlias, hollyhocks, bluebells, &c.

We have thus put down somewhat minutely the names of the various trees, shrubs, vegetables, &c., which we saw growing during the past season, on a plot of ground containing only 19,680 square feet—it requires 21,800 feet to make half an acre—and, as we remarked in the former article, we found them all so arranged as to avoid any appearance of confusion. We have given the names of the varieties not so much to recommend them, as for a guide or index to new hands at cultivating small plots.

Mr. Smith states that, in order to make the most of a small space, he sets the peach trees between others that are longer-lived, expecting to gradually remove the former, after getting three or four crops. So in planting apple trees, it is better to set them twice as thickly as they will ultimately be needed, and gradually remove the limbs from one half of them when they interfere, and finally, cut them out altogether. The produce of the trees thus removed would amply repay their expense.

There are many other common garden vegetables not named above, such as carrots, parsnips, celery, spinach, &c.; These Mr. S. remarked that he does not require for his own use, and therefore does not grow them. Just back of the lot there is a bed of asparagus, in a salt-meadow, where it flourishes finely.

EXTENSIVE YIELD OF GRAPES.—Mr. E. A. McKay, of Naples, Ontario Co., was in yesterday with a box of grapes of his own raising. He has one acre of ground from which he has gathered over 10,000 pounds this year. The soil is sandy loam with gravelly sub-soil, similar to that about the Bay. His vines are in rows, running N. 16° E. Mr. McKay has sold in New-York, in Montreal and Quebec, and at other places, the amount named, for which he has probably averaged 15 cents per pound. He puts them up very handsomely in small boxes and they keep well. His grapes are the Isabella variety and are much improved by his system of cultivation. [Rochester American.]

American Agriculturist.

New-York, Wednesday, Nov. 22.

EXPERIMENTS—DETAILS WANTED.

On page 166 our readers will find an article with an illustration, which will doubtless interest every one, as it gives the details of a method actually adopted for using a small plot of ground to good advantage. On the first page some instructive experiments with concentrated fertilizers are given. Another article on this page gives other experiments.

We place a very high value upon experiments of this kind when carefully made. They teach us far more than can ever be learned from theory. We wish correspondents would be very particular in recording the minute details, such as the character of the soil originally; the kind of forest trees that grew naturally upon it; the former manuring and cropping; the character of the subsoil; the inclination of the surface, if it is not level; the kinds of rocks, and loose stones, and pebbles mingled with the soil; the time of sowing and planting; subsequent weather, &c., &c. All these details are interesting and important for those at a distance.

HOW TO MAKE FAIRS PAY.

We found in our visits to the County Shows, this fall, that all of our friends had not learned the secret of making them pay their own expenses. Their reliance for funds was upon the annual subscription of members, and the gratuity bestowed by the State. The State patronage is very desirable for a time, until these institutions are fairly established, when they ought to sustain themselves.

The failure to do this is not to be wondered at, for these societies often fall, of necessity, into hands that have no experience whatever in the management of public enterprises. It is with great difficulty that they contrive to sustain the Shows, from year to year, even with the legislative help. Economy is often practiced in the wrong place, and the premiums are hardly sufficient to call out any spirited competition among those who have the best samples of fruit, vegetables, or the finest animals, to exhibit.

In one county, whose Show we visited, we found a very large concourse assembled, for two days in succession. Probably there were four or five thousand people in attendance. There was no admission-fee charged, to see either the live stock or the fruits and vegetables, and the multitudes dispersed without doing any thing to help the finances of the society, that had provided for them a rich entertainment. Had an admission-fee of only ten cents, been charged, hardly an individual would have failed to go in, and it would have raised four or five hundred dollars, or more, for the use of the society. This properly expended in premiums, would have called forth a fuller representation of the products of the county, and would have made the fair more successful. There are multitudes, in all our rural districts, that will thus pay an indirect tax to the society, who

will never pay an annual subscription of one dollar or more.

EXPERIMENTS WITH NITRATE OF SODA AND GUANO.

We have received and read, with much interest and profit, the first part of the fifteenth volume of the Journal of the Royal Agricultural Society of England. Notwithstanding the reputed enterprise of the Yankee Nation, the farmers over the water greatly excel us in the promptness with which they publish, for general use, the more valuable portions of agricultural intelligence, gathered into the archives of their various societies. In the volume before us articles bear date as late as the 12th of June, of the current year. When shall we get the published Reports of the New-York, Pennsylvania, Ohio, Connecticut, and other State Agricultural Societies for 1854? We fear not till the matters of which they treat shall have become in part stale, if not valueless by age.

The Journal referred to is one of the most valuable of its kind any where published. We have selected several portions to lay before our readers. We have only room this week to allude to some experiments on the subject placed at the head of this article.

The land experimented upon was a peat bog, reclaimed in 1850, thoroughly drained, and a coating of six inches of clay was put upon the entire surface. It was first cropped with oats, then with turnips, and again with oats, and seeded down with grass. In March of last year it was divided into three portions, and treated as follows: the first portion nothing; the second, 448 lbs. of guano; the third, 224 lbs. of nitrate of soda and 112 lbs. of salt.

The yield from the first portion was 3,080 of hay; from the second portion, (guanoed,) 5,940 lbs.; from the third portion, (nitrated,) 6,600 lbs. The value of the hay from the plots, respectively, was \$26 25, \$50 62, and \$56 25. The cost of the guano, nitrate and salt is not given. Taking them at their average price in this country, the cost of the guano would be about \$11, and the nitrate of soda and salt, taken together, would amount to very nearly the same sum. Deducting this cost from the value of the increased yield, and we have a direct profit, from the 448 lbs. of guano, of \$13 37; and from the 224 lbs. of nitrate of soda, with the 112 lbs. of salt, a profit of \$19.

The experimenter, Jas. Dyce Nicol, remarks that he prefers the nitrate, because it requires little moisture to convey it to the roots of plants. A strong dew appeared to carry it down in one night, and in less than two days afterward the grass turned to a dark luxuriant green color, while the guano is comparatively ineffectual till the fall of a good shower of rain.

Similar experiments upon barley and oats, on a mossy loam with a mixture of clay, resulted in favor of the guano. It is to be noted, however, that in these experiments no salt was used.

HAVE the courage to do right at the risk of being ridiculed by man.

CIDER—WHAT IT IS MADE OF.

A few years ago, while stopping in a town in Massachusetts, we fell into a little "temperance discourse" with an old farmer, who was praising up the virtues of his good cider. Finding all our other arguments useless, we tried to carry our point by appeals to his love of cleanliness. But he was equally invulnerable on this point. "His cider was made of clean apples and was nice enough for the king."

We finally agreed to meet him next day, and examine the apples collected at the cider mill. Arriving at the mill, we together measured off the quantity required for one barrel of cider, and commenced looking them over. The result was that one heap of clean apples contained *one thousand seven hundred and eighty-six* wormy specimens. We of course could no longer contend that such fruit would not produce a rich flavored, and peculiarly nutritious beverage. Our friend gave up his point, but soon after found a relief in "the fact," "that the cider worked itself off clean," and that although new cider might not be so pure, fermented cider was quite so. He did not, however, inform us *how* the cider purified itself, or by what process the "worm juice," is separated from the apple juice; nor have we yet found any one who could solve the mystery. Till we do we shall prefer father "Adam's ale."

ANOTHER NATIONAL POULTRY SHOW.

On Thursday evening last quite a number of gentlemen, mostly managers of the National Poultry Society organized last January, met at the Astor House to talk over the subject of an Annual Show. There was a unanimous opinion expressed that there should not only be a National Show, the coming winter, but also that a strong effort should be made to get up an exhibition on a larger and more magnificent scale, if possible, than any hitherto held in this country. A committee on premiums was appointed, and they were instructed to prepare a premium-list, offering still larger sums than were given at the first exhibition. The committee consists of Messrs. Solon Robinson, Wm. DeLemano, and G. W. Tuttle.

A committee was also appointed to prepare and publish an announcement of rules and regulations, to appoint judges, and make all other necessary preliminary arrangements, and to have charge of all matters relating to the show. The committee of arrangements consists of Messrs. John N. Genin, M. P. Beers, Lorillard Spencer, J. S. Oatman, and Benjamin Haines.

A resolution was unanimously adopted alluding to the satisfactory manner in which Mr. Barnum had carried out the task undertaken by him at the former exhibition, and earnestly inviting him to assume the same responsibility for the forthcoming show. Mr. B. acceded to the invitation, and promised to do still more than formerly, as he should have a much greater time for preparation. We predict a gathering of fowls worthy of at least a short pilgrimage to witness.

WILD TURKIES.—The inquiry of the editor of the Poultry Chronicle is received, and will be replied to soon through the columns of the *American Agriculturist*.

EIGHT ACRES OF PLASTERING.—A subscriber says that the plastering of the Antioch College, at Yellow Springs, Ohio, (see advertisement,) covers a surface equal to eight acres.

THE VINE DISEASE is making sad havoc—if sad it can be called—throughout most of the vine-growing countries of Europe. Recent intelligence shows that the blight has been far more prevalent than at any former period.

POTATOES ON HALF AN ACRE.—The Hartford Courant says that an Irishman, near Belchertown, Mass., has raised 300 bushels of potatoes the past season, on half an acre of peat swamp. Evening Post, please make a note of this.

THE CONNECTICUT VALLEY FARMER has changed hands and place of publication. It will hereafter be published monthly, at Amherst, Mass., by the Editor, Professor Nash. The price (formerly 50 cents) hereafter is to be \$1 a year. We wish much success to this efficient co-laborer in the field of agricultural improvement.

CREAM HILL AGRICULTURAL SCHOOL.—We have received the annual catalogue of this school, located at West Cornwall, Conn. The plan of the school is to receive a limited number of pupils into the family of the teachers, and to give them instruction in the various branches of science, and at the same time, out-door exercise and instruction upon the farm. We can not speak at present so much from personal observation of the advantages of the school; but hope to look into them more particularly when our usual farm visits or lectures shall call us that way. The school is under the care of Messrs. Samuel W. Gold, M. D., and Theodore S. Gold, M. A.

BOOK NOTICES.

We have just read a new book, published by J. C. Derby, of New-York, entitled "THE NEWSBOY;" author unknown. We found it so interesting that we finished its 557 pages at two sittings. It is written in good style, is well adapted to awaken generous and noble sentiments, and, in short, *pays* for reading—which is saying much for a now-a-days' book. Those influenced by our opinion will secure and peruse the book. Price \$1 25.

THE WIDE-AWAKE GIFT, and Know-Nothing Token, for 1855. By "One of 'em." Boston: Phillips, Sampson & Co. New-York: J. C. Derby.

Whatever objections one may have to the origin of this book, he can certainly have none to the book itself. It is thoroughly American in its character, being mostly compiled from the works of the most eminent writers and orators of our country, and contains, among other things, the Constitution of the United States. It is neatly bound in cloth, and ornamented with a full-size por-

trait of Daniel Webster. We do not admire the title; though that is a matter of little consequence. It is pleasant, in these days, to get hold of a book containing something more than splendid titles and pompous prefaces.

ADVERTISEMENTS.—In our advertising columns our readers will often find matters of special interest. In this number we refer them particularly to the advertisements of Andre Leroy's nurseries, at Angers, France, and to the poultry of Mr. Plaisted, Great Falls, N. H. We would also call the attention of gardeners and horticulturists to the one addressed "To Horticulturists," by S. at Kingessing Post-office, Philadelphia Co., Penn.

For the American Agriculturist. NEW JERSEY FARMING.

It does not require a great deal of very acute observation to discover that many important points in farming need to be carried into practice, in order to place New-Jersey farming and her farmers where they should be; and to draw attention to this fact, I can not speak of it as a system, so much as the want of all system. Occupying as she does a commanding situation between two of the most important markets in the world, one on each side of her, she ought to be fully up to the times in farming, if nothing else. Hence the propriety of more liberal investments to secure to herself the benefits of this trade.

The lower parts of the State, bordering upon the Philadelphia market, are generally understood to be in better condition than the more northern counties, owing to the presence of marl beds, the great value of which is beginning to be understood and appreciated. We have in our counties (Morris, Sussex, and Warren) no marl of much consequence; but we have what is perhaps fully equal to it, and which may be easily obtained at a reasonable cost—I mean lime and muck, two good fertilizers which, if judiciously applied, would cause nature to smile upon us and yield her increase abundantly—and when I say judicious in this case, I mean liberal. Farmers generally do not devote as much strength of purse and labor upon the collection of manures, and the making of compost heaps, as they should; not for the sake of pleasing others, but for their own profit. There are few farmers but can testify to the value of very rich land, as they are always loud in its praise. As an illustration, I may mention my own garden this season. I have been for two or three years enriching it by the most liberal application of manures, for a particular purpose. Last spring I planted cabbage in different parts of it, and raised heads that weigh from 15 to 20 lbs. or more. I have sold the most of them for 12½ cents per head, and have some for which I am offered 1 cent per pound. Besides the great and satisfactory increase of crops, the land is easier worked and much more to be relied upon for a paying crop. All these are not trifling advantages, and although it is but a repetition of a familiar fact, yet there is too small a proportion of farmers who realize these advantages.

Every practical man should, therefore, urge a liberal system of composting manures, as the farmers' true source of wealth.

Another point in New-Jersey farming worthy of consideration, is the products of the soil. All lands are not grass lands, neither are all lands grain or fruit lands. Neither can the one always be conveniently adapted to the other, and at a reasonable expense. Any attempt at this, with ordinary means, is what I call ill-directed labor. Grain, if your land is in good heart, is always a cash crop, and, at modern prices, certainly a paying one. Instance the continued high prices of bread stuffs. Buckwheat we may quote as worthy of particular note; it is a grain that grows on very ordinary soil, and yet it is in demand at \$4 per hundred pounds in flour—here in the very heart of a buckwheat growing country.

But the great point wherein I consider New-Jersey farmers behind the times, is in the raising of fruit. All along the great rail-way and river thoroughfares of New-York State, and, indeed, the Western States at large, particularly Ohio, Illinois, Michigan, and Indiana, they understand this matter, and with the genuine go-ahead-iveness of true born Yankees, they are planting immense orchards of every kind of fruit adapted to the climate; and while a Jerseyman plants a peach orchard or two and then stops, these *wide-awake* Yankees will walk right into the pockets of consumers, and laugh and grow fat on Jersey indifference.

If any State in the Union is favorably located for the profitable growing of fruit, it is New-Jersey—her soil is perfectly congenial to the growth of fruit. We would advise Jerseymen to delay the liberal planting of fruit trees no longer; but to avail themselves of every opportunity at hand to compete with their prosperous neighbors. W. D.

MORRISTOWN, New-Jersey.

For the American Agriculturist. VERMONT VS. CALIFORNIA.

* * * In looking over your paper I noticed an article relating to California products. I am sure we need not go out of old Vermont to beat them. I raised, the present year, six squashes, from two seeds, weighing 806 pounds—the smallest weighing 86, the largest, 140½ pounds. Also, watermelons nearly as large as the Californians'. I would be very happy to forward seeds by mail to any one of your readers who desires to cultivate them. JOHN McKEE.

BRISTOL, Addison Co., Vt.

WATER RAM.—A correspondent, from Halifax, N. C., thus writes us in regard to one on his premises:

I am satisfied that no ram has ever worked more successfully than mine. It is placed about forty feet from the spring, which has a fall of ten feet, and a copious supply of water—as more escapes from the spring, by another source, than goes to supply the ram. The discharge-pipe is 116 feet in length, half an inch bore, and the place where the water is discharged, at the rate of sixty gallons an hour, is 70 feet perpendicular above the bend of the ram. It has seldom stopped during the two years it has been at work, and only at such times as the ravine was filled by heavy rains, or when the flange of the pipe was out.

Scrap-Book.

"A little humor now and then,
Is relished by the best of men."

ON A WIFE'S DAGUERRETYPE.

No sunbeam gliding o'er the earth,
E'er played a kinder part;
It stayed awhile
To catch thy smile—
When it was won,
Stole lightly on,
And touched thy husband's heart

"SCAT."

THE editor of the Albany (N.Y.) State Register thus discourseth upon the subject of cats and caterwauling:

Our landlord is the owner of a block of twelve houses—six on Pearl street and six on Broadway—the lots meeting midway between the two streets. On the rear of these lots are the out-houses, all under a continuous roof, some twelve feet high, twenty wide, and say a hundred and forty long. In the rear of the Broadway dwelling-houses are one-story tea-rooms, or third parlors, the roofs of which you can step on from the windows of the second stories of the houses. Well, what of all that? asks the reader.

There's a great deal of it. We don't pretend to know how many cats there are in the city of Albany—indeed, we never heard that they were included in the census. We do not pretend to say that all congregate on the roofs of those out-houses nightly, but if there's a cat in the Sixth Ward that don't have something to say on that roof every night, we should like to know who owns it. We are against cats. We regard them as treacherous and ungrateful animals—as having but small moral developments. We are against cat-erwauling generally, and especially in the night season, when honest people should be in bed and asleep. We don't like to be awakened by their growling and crying, and the hundred of other nameless noises by which they frighten sleep from our pillow. We give the owners of the cats that hold their conventions on the roofs of our landlord's out-houses notice that we've a double barreled-gun, powder, shot, and percussion caps. We've got a bundle of clubs and a basket of brick-bats, and if any cat fails to appear at the usual time in the morning, the best place to look for it, in our judgment, is on that roof.

Last night—it may have been 1 o'clock, or 2, or 3—we were awakened by the awfullest screaming and sputtering, and growling, that ever startled a weary man from his slumbers. We leaped out of bed under the impression that at least twenty children had fallen into as many tubs of boiling water. We threw open the window and stepped out upon the tea-room; we do not intend to exaggerate, but we honestly believe that we saw not less than three hundred cats over against us on the roof of the out-houses, each one of which had a tail bigger than a Bologna sausage, his back crooked up like an ox-bow, and his great round eyes gleaming fiercely in the way of caterwauling. Two of the largest—one black as night, the other a gray or brindle—seemed to be particularly in earnest, and the way they scolded and screamed and swore at each other was a sin to hear. We can not undertake to report all they said. A decent regard for the proprieties of language compels us to give only a sketch of the debate:

"You miserable, big-tailed, hump-backed, ugly-mugged thief," screamed the gray. "I'd like to know what you're out here for this lime of night, skulking and creeping, and

noising about in the dark, poaching upon other people's preserves."

"Very well! mighty well!" was the reply, "for you to talk, you black-skinned, ogre-eyed, growling and sputtering robber, to come upon this roof sticking up your back and taking airs upon yourself. I'd like to know what business you've got to be prowling around and crowding yourself into honest peoples' company."

"I'm a regular Tom cat, I'd have you know, and I go where I please, and I'll stand none of your big talk and insolent looks."

"Insolent! Hear the cowardly thief!—Insolent! Very well, Mr. Tom cat, very good indeed! Now just take your black skin off of this floor, or you'll get what'll make you look cross-eyed for a month."

"Get off this roof I think you said. Look at this set of ivory and these claws, old gray-back! If you want I should leave this roof, just come and put me off. Try it on, old beeswax! Yes! yes! try it on once, and we will see whose eyes will look straightest in the morning. Come on, old hump-back! old sausage-tail!"

And then they pitched in, and such scratching, and growling and biting, and rolling over and over, we never happened to see or hear before. About that time we dropped a brickbat (accidentally of course) weighing about a pound, right among them. Whether it hit any one we can't positively affirm; but we heard a dull, heavy sound of *chug*, as if it had struck something soft, and the scream of one of the belligerents was brought to a sudden stop by a kind of hysterical jerk as though there had been an unexpected lack of wind to carry it on. It put an end to the disturbance, and all the rioters, save one, scampered away. That one remained all doubled up in a little heap, like as if it had the sick head-ache or inflammation of the bowels. If anybody's cat is found this morning with a swelled head, or a great bunch on its side and seems dumpish, it's our opinion that that's the one that brickbat fell upon last night.

FORESEEN FUN.

THE New-Orleans Picayune says: "We have heard in our day of *legal quibbles*, but if a Philadelphia lawyer can beat the following, lately argued to a Jury in this city, he can take our hat, aye, and our *corduroys*. The prisoner is on trial for *entering* a house in the night-time, with intent to steal. The testimony was clear that he had made an opening sufficiently large to admit the upper part of his body, and through which he protruded himself about half way, and stretching out his arm committed the theft. Mr. Obfuscate Brief addresses the Jury. "What an outrage," (looking horrified, and with outstretched and trembling arms,) "I repeat, what an outrage upon your intelligence and your common sense is it for the State's Attorney to ask at your hands the conviction of my client on such testimony! The law is against *entering* a house—and can a man be said to *enter* a house when only *one-half* of his body is *in* and the other half *out*? Gentlemen, look to the Divine Law on this point. God commanded Adam and Eve not to eat the apple—*i. e.* the whole of the apple. And all the commentators agree that if they had only eaten *one-half*, they would not have been expelled from the blooming garden of Eden." The Jury brought in a verdict of "guilty" as to *one-half* of his body from the waist up, and "not guilty" as to the other half. The Judge sentenced the guilty half to one year's imprisonment, leaving it to the prisoner's option to have the innocent half cut off, or take it along with him."

Costly apparel—a law suit.

A CURE FOR COQUETRY.

KATE SHELDON was a buxom country lass, fair, stout, and rosy. With all these attractions it may be imagined that she was the belle of the village, the object of admiration of a dozen or more rustic swains. Of course Kate was conscious of her power—it did not take her long to learn that—and coquetry came by intuition. Among her admirers was one—William Barclay—to whom Kate secretly gave the preference. But she was not going to yield her consent at once—not at all. So in the true spirit of coquetry, she would now vouchsafe a smile which set his heart to beating faster, and anon put on a look of coldness which filled him with despair. William got heartily tired of this treatment and determined to bring matters to a conclusion.

"Now Kate," said he, as they sat together one summer afternoon in the kitchen, where Kate was engaged in the interesting employ of paring apples for a pudding to be served up the next day. "Kate, why can't you tell me at once whether you like me or not, and whether you will marry me?" "Good gracious! how should I know? I never thought of the subject." "Well, at any rate, you can tell whether there is anybody you like better." "Let me think—well may be so, and may be not. I couldn't precisely say. What do apples fetch a bushel?" "O, confound it, why can't you answer my question?" "Because you haven't answered mine." "Well, two dollars. Now—" "Have you got the brindled cow you used to have last spring?" "Yes, but—" "Is she good for milk as she used to be?" "Yes." "How warm it is. Do you like apple pudding?" "Yes, but I like you better, and I can't live without you. That's the long and short of it, so if you won't marry me just say so and I'll go and jump into the well, at once. There won't be any use in living." "Don't talk so foolishly." "But I mean it. I'll wait five minutes, and if you don't say yes in that time, I will jump into the well, and you will have the satisfaction of knowing that I died for you."

Kate did not believe this in the least, so she continued to tease him. At the end of the time mentioned, William rose with a sigh and saying "Farewell, forever," hurried out. Arrived at the brink of the well, he pushed in a heavy log which lay beside it. Kate heard the splash, and rushed out to the well. William was no where to be seen.

"O, William," said she wildly, the woman triumphing over the coquette, "come to me once more and I will marry you, indeed, I will."

On hearing these words, William stepped forward from behind the house where he had stationed himself, and claimed the fulfilment of the promise. Kate objected that it was obtained on false pretence, but finally consented to ratify it.

Moral: Lovers who are on the point of sacrificing themselves on the altar of affection, are requested to consider whether a log of wood would not prove a more agreeable and equally efficacious substitute.

ANNOYING.—Is it lawful to keep a dog which barks, howls and yells all night long? And if lawful, is it humane, is it christian, is it neighborly? We don't mind a perpetual bark, at the rate of a hundred and twenty reports per minute, up to say three o'clock in the morning, but after that time it very disagreeably disturbs the melodious hum of the musketoos, and is apt slightly to interfere with one's rest. They say that every dog must have his day; but those in our neighborhood seem determined to have the night also.

NO!—A GOOD LESSON.

No!—That is a very short word. It has a very short meaning sometimes. It often blasts fond anticipations; it may change the whole tenor of a life. In matrimonial matters it would be better that it should be oftener said than it is, for many of that sex say no when they mean yes, and should use the shorter word when they do not.

One Sunday evening not many nights ago, the Rev. Mr. Thompson performed a marriage ceremony at the Tabernacle—both parties said yes at the proper time, and the revered gentleman said amen.

"I want you to perform the same thing for me," said a well-dressed youngish man to Mr. Thompson.

"When?"

"Now—right off—to night."

"Can't you put it off a little? It will make it rather late."

"No—the lady says now or never, and I am very anxious. Will you go?"

"Yes; where is it?"

"Close by—only a few steps west of the park. We are all ready, and will not detain you but a few minutes on your way home."

Mr. T. went to the place, which was a respectable boarding-house, and everything evinced decorum. The lady—young and pretty, neatly dressed, and altogether a desirable partner for the gentleman—was presented and a short prayer, as usual upon such occasions, offered, and then hands joined.

"You, with a full sense of the obligations you assume, do promise, here in the presence of God and these witnesses, that you will take this woman, whose right hand you clasp in yours, to be your lawful wedded wife, and as such you will love and cherish her forever."

"I do."

"And you Miss, on your part, will take this man to be your lawful wedded husband?"

"NO!"

We have heard in time past, when showers were fashionable, some pretty heavy claps of thunder, but none that ever rattled about the tympanum of that bridegroom was quite so loud as that stunning little monosyllable.

"No, I never will!" said she most emphatically, and walked away proudly to her seat, leaving her almost-husband looking and probably feeling just the least trifle in the world foolish.

Mr. Thompson remonstrated—not to induce her to change that no for yes, but for trifling with him in a solemn duty of his calling, and asked for an explanation.

"I mean no disrespect to you, sir, or to trifle with your duty, or the solemn obligation you are called upon to ratify; but I had no other way to vindicate my character. I came to the city a poor sewing girl. I worked for this man. He made proposals of marriage to me, but from other circumstances I doubted his sincerity, and left his employment and went back to the country a while. When I returned, I found the door of my former boarding-house closed against me, and this lady, whom I had esteemed as a kind friend, cold and quite indisposed to renew my acquaintance, and I insisted upon knowing the reason. I learned that this man had blackened my character, denied his proposals of marriage, and said I was—no matter what. I said to the lady 'let me come back and I will prove my innocence. Will you believe what I say if he will now marry me?'"

"Yes, I certainly will, and so will all who know you."

"I renewed the acquaintance—he renewed the proposals—I accepted, and said 'yes, go

get the minister at once.' He slandered me—I deceived him. I proved my words true, and his false. It was the only way a poor, helpless girl had to avenge herself upon a man, who had proved himself unworthy to be her husband. It was only at the right time, to say one word—one little word. I have said it. I hope it will be a lesson to men, an example to other girls, and that in many other and different circumstances they will learn to say no."

"If I was angry for a single moment," said Mr. Thompson, "I carried none of it over the threshold." It was a severe lesson, but well applied. I went home pondering upon the value of that little word—No.

New-York Tribune.

MRS. PARTINGTON ON CLOCKS.

"The adventitious people didn't bring the world's end about so easy as they thought," said Mrs. Partington, at the recollection of seeing a long-legged saint in a white cotton gown on the top of a neighboring house the night before. "Yes," replied old Rodger, gravely, "it did come to an end; it suspended for a little while, when a meeting of its creditors was held, and though its affairs were found a little shaky, it was thought best to let it go on, and it would come out all right enough." "You don't say so!" cried she, "well that's the reason why my clock is half an hour slow, and I declare I couldn't account for it." Ike said nothing—but that he was allowed to stop out till half-past seven the night previous, made it look as if he might have put the clock back, but there was no knowing. [Boston Post.

REV. T. P. HUNT.—We have heard many good things that emanated from the keen wit of this reverend gentlemen, but the last one threw us down entirely. A man recently passing Mr. Hunt was accompanied by a small dog, and the little scoundrel took a sudden fancy to stick his teeth in the old gentleman's leg. This physical manifestation not proving satisfactory to the clerical victim, he determined to victimize the dog, in turn, and drawing the big end of his cane, soon added another subject to the dog tombs. Thus began the dramatic tragi-comedy:

Stranger—"Why did you kill my dog?"

Hunt—"Because he was going to bite me."

Stranger—"Why didn't you use the small end of your stick? you could have frightened him and not killed him!"

Hunt (excited)—"Why didn't your dog come at me tail first, then?"

An exquisitely dressed young gentleman, after buying another seal to dangle about his delicate person, said to the jeweler that he would ah like to have ah something engraved on it ah to denote what he was. "Certainly, certainly; I will put a cipher on it," said the tradesman.

Two lovers stood upon the shore of Massachusetts Bay, bidding a sad farewell before Seth tore himself away, "I'll marry you when I come back my Sally Ann," says he; and then he took a little *smack* and went away to sea.

Dobbs says he would have died of the cholera, in August, if it had not been for one thing—"the Doctors gave him up." Two days afterwards he says he was a well man, indulging in succotash.

A NEW SOCIETY.—The last society spoken of in California is the "Pay-Nothings." It is said to be alarmingly prosperous. The pass-word is "Lend me a dollar"—and the response, "broke."

A CANDIDATE FOR MATRIMONY.

A lady advertising for a husband in the Water Cure Journal, gives the following description of herself. She would seem to have some fine "points":

"I am just twenty, but will not marry before I am two years older. I am a graduate of the Marietta Seminary. I can do, and love to do, all manner of house-work, from making pies and bread to washing shirts. I can do all kinds of sewing, from embroidery to linsey pantaloons. I can skate, ride, dance, sing, play on the piano or spinning-wheel, or anything that may reasonably be expected of my sex. If required, I can act the part of a dunce in society of the upper ten, or the part of a woman among women. As for riding, here allow me to make a banter: any man may bring two horses, give me choice and ten feet, and then if he overtakes me in one mile I am his; if not, the horse is mine. Beware!"

"I am a believer in hydropathy, and use no tea or coffee, neither do I wear corsets; but I am willing my husband shall do either, if he desires. I believe in 'women's rights,' but believe I have no right to meddle with politics, or men's business in general, nor have men the right to meddle with ours. As for appearance, I am neither tall nor short, large nor small, but I am just as I was made. I have never attempted to alter my shape or color, as I am perfectly satisfied with the same. By fops, I am styled handsome; by the young men on whom I please to smile, I am styled the height of perfection; by those I frown upon, 'the devil's imp;' by the wise and sober, I am called wild and foolish; by my female acquaintances, 'Molly;' and by my uncle I am called 'Tom.'

"If I marry, it will be a man who uses no spirits, tobacco or profanity. He may be young or old, handsome or homely, rich or poor, but not in the extreme; he must have a good common education, at least; he must be industrious; he must be capable of so bearing himself in any society that he will be beloved by all; his disposition on after acquaintance must please in every respect; he, after marriage, must allow me to follow the dictates of my own conscience, provided I do not trample on his rights, and he must follow suit."

THE TRUE WOMAN.

THE true woman, for whose ambition a husband's love, and her children's adoration are sufficient, who applies her military instincts to the discipline of her household, and her legislative faculties in making laws for her nursery; whose intellect has field enough for her in communion with her husband, and whose heart asks no other honors than his love and admiration; a woman who does not think it a weakness to attend to her toilet, and who does not disdain to be beautiful; who believes in the virtue of her glossy hair and well-fitting gowns, and who eschews rents and raveled edges, slipshod shoes, and audacious make-ups; a woman who speaks low and does not speak much; who is patient and gentle, intellectual and industrious, loves more than she reasons, and yet does not love blindly; who never scolds and rarely argues, but who adjusts with a smile; a woman who is the wife we have dreamed of once in our lives, and who is the mother we still worship in the backward distance of the past; such a woman as this does more for human nature and more for woman's cause than all the sea-captains, barristers, judges and members of Parliament put together—God-given and God-blessed as she is. [Dickens.

Few men take his advice who talks much

VILLAGE MAKING.

AMONG the many queer businesses in our city, one of the queerest, and at the same time not the least profitable, is that of village making; and this is the way they make suburban villages about our city. Mr. Money-penny, Mr. Bangum, and Mr. Noceross form themselves into a company and purchase a farm on Long-Island, at \$1,000. This they then divide into three hundred lots, each of them taking fifty lots for himself, and leaving the remaining one hundred and fifty to be disposed of. The next thing is to open an office, hire an agent, draw plans and maps of the village of "Utopia," advertise to the world the "Utopian Village Building Company," and wait for the result. Soon a mechanic comes down to the office to look over the plans, and talks about purchasing a lot. By frugality and industry he has laid up a thousand dollars, and he wishes to buy a convenient spot in the country where he may build himself a house and live on his land. On looking over the map with the agent, who is a very agreeable man, and gives him much *valuable information*, he points out one lot convenient to the depot—not yet built, (but this the agent forgets to tell him)—and asks his price. "Ah," says the agent, "that lot is taken by Mr. Money-penny. He has also the five adjoining lots. He is talking of building a factory there." Our mechanic knows of Mr. Money-penny as a shrewd and wealthy real-estate broker, and his confidence in the "Utopian Village Building Company" increases. He points to a lot on the opposite side of the street. "That," says the agent, "is taken by Mr. Bangum." Mr. Bangum has an immense reputation in the community—was never known to touch anything without its becoming golden. "But the next lot is not taken," continues the agent, "and it is just as good—though I half promised the refusal of it to Mr. Noceross, who owns the lot on the other side." "Does he own much out there?" asks our friend. "Immensely," says the agent, touching off half a dozen or more of Mr. Noceross's lots; "he knows where real estate is going to rise, he does." The upshot of the affair is, that the lot is made over to our friend, and his \$100 are made over to the company. In this way the spare one hundred and fifty lots are soon disposed of, on the faith of Mr. Money-penny, Mr. Bangum and Mr. Noceross. These gone and the worthy trio sell out their own lots, as they had sold out the former ones, and before Utopia's really turned from a farm into a village, their interest in it is all sold, they have bought a new farm, created a new company and christened a new village, and commenced pocketing the fruits of a new speculation. This is the way New-Yorkers make their fortunes, by selling for \$30,000 what cost six months before \$1,000, and this is the way suburban villages are built around New-York. [New-York Correspondent.]

BEAUTIFUL "EPITAFF."—The San Diego Herald publishes the following, written upon a young man who was accidentally shot, in that vicinity:

"here lies the body of Jeems Hambrick who was accidentally shot on the bank of the pacus river by a young man he was accidentally shot with one of the large colt's revolver with no stopper for the cock to rest on it was one of the ole fashing kind brass mounted and of such is the kingdom of heaven."

No man can avoid his own company—so he had best make it as good as possible.

NEVER think that which you do for religion is time or money misspent.

SLEEVES AND SAUCE.

THE most stupid and ugly fashions always last the longest. How many years the long dresses have swept the streets! For the last twelve months bonnets have been flying off the head, and so, probably, they will continue for twelve more. However, the bonnets are simply ridiculous. As to long dresses, there is something to be said for them. They are convenient to aged ladies. They enable them to enjoy, without attracting remark, the comfort of list slippers and laeed stockings and rollers for their poor old ankles. They render it possible for young ladies to wear bluehens and high-lows, thereby avoiding damp feet, and to save washing, by making one pair of stockings last a week. So they will doubtless continue to be worn while the laws of fashion are dictated by a splay-footed beauty, or a lady troubled with bunions. But this kind of apology can not be made by hanging sleeves. They are not only absurd but inconvenient. They are always getting in the way, and in the sauce, and the butter-boat. Your wife can not help you to a potato across the table but she upsets her glass, and breaks it with her dangling sleeve. It may be said that your wife has no business to help potatoes—that there ought to be footmen in attendance for that purpose. Certainly; or else, she should not wear the sleeves. But ladies must, of course, follow the height of fashion, whether suitable to their circumstances or not. Could not the leaders of fashion, then, in pity to the less opulent classes, devise and sanction a kind of sleeves, adapted to life in a cottage—whether near a wood or elsewhere—to be called cottage sleeves, and to be worn by the genteel cottager-class without prejudice to their gentility? [Punch.]

GOOD ADVICE TO YOUNG WOMEN.

Trust not to uncertain riches, but prepare yourself for every emergency in life. Learn to work and not be dependent upon servants to make your bread; sweep your floors, and darn your own stockings. Above all things, do not esteem too lightly those honorable young men who sustain themselves and their aged parents by the work of their own hands, while you care for and receive into your company those lazy popinjays who never lift a finger to help themselves, so long as they can keep body and soul together, and get sufficient to live in fashion. If you are wise you will look at this subject as we do, and when you are old enough to become wives, you will prefer the honest mechanic, with not a cent to commence life, to the fashionable loafer, with a capital of ten thousand dollars.

Whenever we hear remarked "such a lady has married a fortune," we always tremble for her prosperity. Riches left to children by wealthy parents often turn out a curse instead of a blessing. Young woman, remember this; and instead of sounding the purses of your lover and examining the cut of the coat, look into their habits and hearts. Mark if they have trades and can depend on themselves; see if they have minds which will lead them to look above a butterfly existence. Talk not of the beautiful, white-skinned, soft, delicate hand—the splendid form and the fine appearance of the young gentleman. Let not those foolish considerations throng your thoughts.

A VERY steady old farmer was once found betting against a roulette table. Upon expressing very natural surprise at this sight, the old gentleman assured us, 'upon his honor he didn't want a cent of their money.' 'What are you playing for then?' 'Because they have got about fifty dollars of mine.'

OLD FOLKS.

THERE is now living in the town of South-east, Putnam County, N. Y., a family of five generations, as follows: Jerusha Paddock, aged 99; her daughter, Jerusha Smith, aged 79; her grand-daughter, Rebecca Crosby, aged 52; her great-grand-daughter, Eliza Denton, aged 32; and her great-great-grand-daughter, little Miss Denton, aged 6. The lady of 99 appears as though she might considerably overtop 100 in her earthly account of years, and her daughter of 79 looks fully competent to take her tea regularly and enjoy the evening of life a round score of years yet; while the grand-child of 52 has a countenance expressive of true enjoyment of existence. If the latter lives as long as her grandmother (and we see no reason why she may not) she has 47 long years left in which to taste the sweets of the earth. She is now in her pilgrimage, just about where many sink down, and give up the hope of traveling further; yet, judging from the hale appearance of her ancestor, she may yet go on as far ahead as she has already come. But, skipping over the young mother of 32, what a long, long "road to travel," is before the great-great-grand-daughter of 6, should she live to the age of her double-chinned ancestor. Let us see—93 years added to the number that now sit lightly upon that curly head, would carry her into the middle of another century—1946! Verily, a good long life is not such a fleeting thing, after all.

LEARNING TO SPELL

BAD spelling is discreditable. Every young man should be a master of his native tongue. He that will not learn to spell the language that is on his tongue and before his eyes every hour, shows no great aptitude for the duties of an intelligent, observing man. Bad spelling is therefore a discreditable indication. It indicates a blundering man; a man that can not see with his eyes open. Accordingly, we have known the application of more than one young man, made with great display of penmanship and parade or references, rejected for his bad spelling.

Bad spelling is a very bad indication. He who runs may read it. A bright school-boy, utterly incapable of appreciating your stores of science, art, and literature, can see your blunders. You will find it hard to inspire that boy with any great respect for your attainments. Bad spelling is therefore a mortifying and inconvenient defect. We have known men thrown into very prominent positions, so ashamed of their deficiency in this respect, that they never ventured to send a letter until it had been revised by a friend. This was, to say the least of it, sufficiently inconvenient.

We say again learn to spell. Keep your eyes open when you read, and if any word is spelt differently from your mode, ascertain which is right. Keep your dictionary before you; and in writing, whenever you have the least misgiving about the spelling of a word, look at it at once, and remember it. Do not let your laziness get the better of you.

It's the little troubles that wear the heart out. It is easier to throw a bomb-shell a mile, than a feather—even with artillery. Forty little debts of one dollar each, will cause you more trouble and dunning than one big one of a thousand.

QUESTION.—Why is a lean dog like a man in meditation? Ans.—Because he's a thin-cur.

Good company and good conversation are the very sinews of virtue.

I WILL.—There are no two words in the English language which stand out in bold relief—like kings upon a chequer board—to so great an extent (says a popular writer) as the words "I will." There is strength, depth, and solidity—decision, confidence, and power—determination, vigor, and individuality in the round, ringing tone which characterizes its delivery! It talks to you of triumph over difficulties—of victory in the face of discouragement—of will to promise, and strength to perform—of lofty and daring enterprise—of unfettered aspirations, and of the thousand and one impulses by which man masters impediments in the way of progression.

TWO-THIRDS OF A MAN.—In Smith's Federal Calculator an amusing anecdote is given, to the following purport: A first rate class was undergoing a close examination in mental arithmetic, and in reply to a question concerning the number of men required to perform a certain piece of work in a specified time, the class responded, "Twelve men and two-thirds." But one bright fellow, more discerning than the others, instantly added, "Twelve men and a boy fourteen years old." fourteen being two-thirds of twenty-one, the legal age of manhood!

THE BOSTON MEDICAL AND SURGICAL JOURNAL argues against the excessive exactions made upon the mental powers of children in school. The imposition of such severe tasks upon young and growing children enfeebles their constitution, and often incapacitates them for the enjoyment of the pleasures and fulfilment of the duties of maturer years. Such close application to study produces a train of diseases which can not always be eradicated. Aching head, loss of appetite, sleepless nights, inflamed eyes, with other deviations from health, are the accompaniments and consequences of such excessive mental exertion.

INDOLENCE.—"Mother," said a young lady of our acquaintance, the other day, to her mother, "shut the door." In peering into the dim vista of the future, we thought we could see this same young lady reclining on a dirty cushion, her whole attire slovenly, three ragged children shying about the room, and she calling to the father of them, saying, "Here husband, it is time to peel the potatoes for dinner!"

Young man if you should chance to catch your particular star in the galaxy of belles, saying, "mother, shut the door," when she could as conveniently do it herself, keep your eyes peeled for "breakers ahead."

Janesville Free Press.

ONE of our exchanges has the following hit: The late Rev. Mr. Chapin being asked of what use the elders were in a church, replied, that it was said to give power to ministers. He was a unit, the elders cyphers; placed upon the right hand, they increased his power, "But," he added, "my elders have got on the wrong side, and reduced me to a decimal fraction."

A FAN MILL FOR FRIENDS.—"I weeded my friends," said an old eccentric friend, "by hanging a piece of stair carpet out of my first floor window, with a broker's announcement fixed. It had the desired effect. I soon saw who were my friends. It was like firing a gun near a pigeon-house; they all forsook the building at the first report, and I have not had occasion to use the extra flaps of my dining table since."

SAVE when you are young, to spend when you are old.

BEAVERS.

THE beavers which inhabit the northern parts of Europe, are said to be essentially the same as those which establish their republican dwellings along the course of our North-American streams. In an article which appears in the North British Review it is stated that these interesting animals still exist in some abundance in certain sections of Sweden and Norway. The number of the tribe has diminished so much latterly, that its members are now very rigorously protected by law, for a considerable term of years. The great requirements of the beaver, are a thinly peopled country, with abundance of wood and water. In the American and Arctic region their northern extension seems to be restricted solely by the deficiency of woods, and they are known to have occurred as far south as the parallel of 30 degrees—or almost to the Gulf of Mexico. "The flesh of the animal is greatly prized by hunters and voyagers, especially when roasted in the skin after the hair is singed off. This of course is an expensive luxury and is frowned at by the fur traders."

The demand for beaver skins has decreased within a few years, owing to the different materials which are now used in the manufacture of hats. In 1808, no fewer than 125,927 beaver skins were exported to England from Quebec alone.

CANADA WHEAT DUTY FREE.—Messrs. Chappel, Fairbanks, and others interested in the milling business here, yesterday telegraphed Secretary Guthrie to inquire when Canadian wheat would be admitted free in bond. They received a prompt answer that a circular to admit Canada wheat was issued yesterday. This regulation of the Treasury Department provides for the admission of wheat duty free, the importers to give a bond for the payment of duties if the Reciprocity Treaty shall not be fully confirmed. We believe the limit of the bond is six months. The arrangement will cause an increased demand for Canada wheat, and considerable will doubtless arrive in bond very soon. Some of our millers have purchased large stocks in the Province in anticipation of the Treasury order. [Rochester Union.]

Markets.

REMARKS.—Flour has advanced the past week 12½ to 25 cts. per bbl.; and corn 1 to 2 cts. per bushel. No change worth noting in other products, especially those of the South.

The Weather has been very fine for all out-door operations; but many of the mechanics and laborers in the city are out of employment, which, with the high price of coal and provisions, will cause much suffering among them the ensuing winter. We wish the farmers could find more employment for them.

Money is more difficult to be got here than ever, and rates of discount higher, owing to the numerous failures and stoppages of Banks and Monied Institutions at the West.

PRODUCE MARKET.

SATURDAY, November 18, 1854.

The prices given in our reports from week to week, are the average wholesale prices obtained by producers, and not those at which produce is sold from the market. The variations in prices refer chiefly to the quality of the articles.

THERE is nothing worthy of especial notice this morning. The market, as usual, is crowded with all kinds of

produce, and the prices are well sustained. There is no noticeable change in the vegetable line, potatoes, &c., being about the same as last week.

Large quantities of apples come in from the West, but many of them of inferior quality. Good apple are scarce, and in good demand. The scarcity of apples in this section of the country will be likely to keep it up. Cranberries are selling for about 50c. more than last week.

Butter, eggs, and cheese, sustain about the same prices.

VEGETABLES.—Potatoes, New-Jersey Mercers, \$3@3 50 ¢ bbl.; White, \$2 25@2 75; Carter, \$2 50@2 75; Nova Scotia, 80c.@\$1 ¢ bush.; Western reds, \$2 ¢ bbl.; Sweet, Philadelphia, \$3 50@3 75; Virginia, \$3 25@3 50; Turnips, Russia, \$1 25@1 50; White, \$1@1 25 Onions, White, \$4; Red, \$1 50@2; Beets, \$3 ¢ 100 bunches; Carrots, same; Parsnips, \$3 25; Cabbages, \$5@7 ¢ 100; Celery, \$1 ¢ dozen.

FRUITS.—Apples, Spitzenbergs, \$2@2 25 ¢ bbl.; Greenings, \$2; Russets, \$1 75; Baldwins \$1 50@1 75; Gilliflowers, \$1 75@2; Newtown Pippins, \$5@7. Cranberries, \$6 50@8 50.

Butter, Orange Co. 21@24c. ¢ lb.; Western, 16@18c. Eggs, 21@23c.; Cheese, 10c.@11c. ¢ lb.

NEW-YORK CATTLE MARKET.

MONDAY, NOV. 20, 1854.

As announced last week, the principal market-day has been changed to Thursday. We went the usual rounds, however, but found very little doing in the Washington Yards. A small lot of animals were offered, but quite unworthy of mention. As heretofore, we shall continue to keep our readers advised of the state of the markets, with as much accuracy as possible, bringing up our reports to the hour of going to press.

SHEEP MARKET.

Monday, Nov. 20, 1854.

The Sheep Market, during the last week, was exceedingly dull, though it evinces this morning a little more activity.

The following are the sales by James McCarty, sheep-broker, at Browning's:

55 Lambs.....	\$112 75
22 ".....	55 75
72 Poor lambs and sheep.....	117 50
121 Sheep.....	577 50
169 Sheep and lambs.....	514 00
12 ".....	30 00
99 ".....	291 75
174 ".....	475 37

150 ".....	2 10	9

The Market this week has been worse than I have ever experienced, for the last seven years, in November. The weather has been unfavorable, and the supply much larger than the demand; consequently prices have declined materially.

The week closes with an abundant supply on hand and the prospect bad. Mutton has been selling by the carcass, in Washington Market, from 4 to 7½c. ¢ lb. Lamb, from 4½ to 9c., as in quality and condition.

APPLE QUINCE SEED—A prime article for stocks—for sale by

WM. DAY, Morrinstown, N. J.

A PROPOSITION.—For the use of \$600

I will BOARD a young Lady or Gentleman, who may wish to educate themselves at Antioch College, Yellow Springs, Ohio. Any one having that amount to spare, can get an education and have the money returned any time after two years. Others boarded at \$2 to \$2.50 per week, from the first of April. Yellow Springs is one of the most healthy and pleasant villages in the West. Address J. J. Lumberton, Ohio.

TO HORTICULTURISTS.—A person

who has been engaged in Horticulture for the last twelve years, will shortly be disengaged, and desires a situation in an extensive Nursery, or in connection with a Horticultural or Agricultural Periodical. Can give satisfactory reference as to ability, &c. Address S. Kingessing, P. O. Philadelphia Co., Pa. Refer to A. B. Allen, Office of the American Agriculturist.

A PAIR OF FINE COACH HORSES for

SALE—Sixteen hands high, long tails; one six, the other seven years old; color gray. These horses are warranted kind, sound, strong, and enduring. They are offered for sale for no fault, but simply for not wanting their use the ensuing winter. They can be had for \$350, which is very cheap for them. Such horses are often sold at \$500 or \$600 in this city. Apply to F. WOODFORD, 191 Water-st., N. Y.

CHOICE POULTRY.—C. C. PLAISTED,

of Great Falls, N. H., (late partner of Dr. John C. Bennett,) now offers for sale a large lot of choice POULTRY, viz:

Four trios of Brahma Pootras, last year's fowls, from \$12 to \$18 a trio; 30 pairs of Chickens, from \$6 to \$10 a pair—bred from the Brahmas exhibited by Bennett and Plaisted, at the National Poultry Show, February last, and which were premium fowls. (Mr. P. has just sold the cock alone for \$50, to F. B. Bernard, of New-Orleans, La.) One trio of Hong Kongs, last year's fowls, price \$15; 4 pairs of Canton Cochins China Chickens, price \$8 a pair; 3 trios of Black Shanghais, price \$10 a trio; White Shanghais \$6 a pair; 20 pairs of Sumatra Pheasant Games—splendid fowls—at \$6 a pair; a few pairs of Malacca Games, at \$10 a pair; also English, Irish, Spanish, and Indian Games, at \$20 a pair, and one pair of very large Hong Kong Geese, price \$20.

N. B.—The above lot of fowls are all PURE BRED, and warranted as such. They are only offered at such very low prices because I have not room to keep so many through the winter.

Money may be sent at my risk, if inclosed and mailed in the presence of the Post-master.

IMPROVED SHORT HORN BULL FOR

SALE.—The subscriber offers for sale his superior Short Horn Bull, PRINCE ALBERT, that won the second prize at the recent State Fair held in the City of New-York.

Prince Albert was calved in 1849; his pedigree is of much merit; in color, he is a deep red with white marks; in temper, extremely mild and easily managed. He is an excellent stock-getter, and would not now be offered for sale, but that the subscriber, in the system of breeding he has adopted, has no further need of his services.

Under these circumstances, he is for sale at the low price of three hundred dollars. The animal may be seen at Ellerslie farm, one mile south of Rhinebeck station. Address personally, or by letter, WILLIAM KELLY, Ellerslie, Rhinebeck.

ANDRE LEROY'S NURSERIES, AT

ANGERS, FRANCE.—Mr. Leroy begs to inform his numerous friends that he is now prepared to execute all orders for TREES, EVERGREENS, SHRUBS, STOCKS, &c., entrusted to his care.

His Trees, &c., are very fine this year, and his collection very complete. Orders should be sent at once, so as to secure the different kinds. The best care will be given to all orders, as usual. The Angers Quince Stocks have not succeeded well this year, and are scarce and high.

Orders should be, as usual, addressed to our agent in New-York, Mr. EDWARD BOSSANGE, No. 138 Pearl-st., who will give all the information desired, and mail, on application, free of charge, a detailed copy of my catalogue, with prices, in dollars and cents.

TREES AND PLANTS.—PARSONS &

CO., Flushing, near New-York, offer for sale their usual assortment, with the addition of many rare novelties of Fruit Trees, for the Orchard and the Garden; Ornamental Trees, Shrubs, and Roses, for the Avenue, Lawn, or Cemetery; Vines for the Grapes, and Exotic Plants for Greenhouse culture. Catalogues can be obtained at No. 60 Cedar-st. or will be sent by mail to all post-paying applicants enclosing a postage stamp.

1,000 ORNAMENTAL TREES FOR

\$100.—Suitable for Belts, Masses, Shrubberies, Woods, &c., in the best and hardiest varieties, strong and well grown—delivered in Boston and New-York. Price list on application. B. M. WATSON, Old Colony Nurseries, Plymouth, Mass.

RASPBERRY PLANTS, of the PURE

RED ANTWERP stock, for sale in quantities to suit purchasers. The Plants are all warranted, and in a thrifty condition, and will be delivered in New-York for \$50 per thousand. VALENTINE H. HALLOCK, Poughkeepsie, N. Y.

P. S.—Orders by mail will be promptly attended to, and no charge made for package. Orders to R. L. ALLEN, 189 and 191 Water-st., N. Y., will receive prompt attention.

MULES FOR SALE.—The subscriber

keeps constantly on hand 400 to 500 MULES, of all sizes. Among these are some of the choicest animals in the United States; 16 hands and over in height, and well proportioned.

Mules are almost the only working animals used in portions of the Southern States, the West India Islands, and Spanish possessions, where severe work and hard usage are allotted them, and under which horses would soon die. An equal advantage would follow their introduction among farmers and others, in the northern States. They are not only much harder than horses, but they will draw more in proportion to their weight; will endure a great deal more; live twice as long, and eat less; and the only dressing or currying they need, is a soft place to roll on. They are gentle, tractable, and easily managed; and nobody who has ever tried them will ever give them up for horses or oxen.

Call on, or address by letter, JAMES BUCKALEW, Jamesburg, New-Jersey. Refer to Amos Chamberlain, Bull's Head, 24th-st., N. Y.

SUPERIOR SEED WHEAT.—A LARGE

assortment of the best varieties of improved Seed Wheat; among which are the Red Mediterranean, White Mediterranean, Soule's and Blue stem. For sale by R. L. ALLEN, 189 and 191 Water-st.

FANCY FOWLS FOR SALE.—A variety

of pure bred Fowls, Asiatic, Spanish and Game Fowls, Scabbie, Black African, Antwerp, and other Bantams. B. & C. S. HAINES, Elizabethtown, New-Jersey

PERUVIAN GUANO.—First quality of

Fresh Peruvian Guano, just received in store. R. L. ALLEN, 189 and 191 Water-st.

WILLARD FELT, No. 191 Pearl-street,

(near Maiden-lane.) Manufacturer of Blank Books, and Importer and Dealer in PAPER and STATIONERY of every description. Particular attention paid to orders.

MACHINE WORKS.—M. & J. H. BUCK

& CO.'S Machine Works, Lebanon, N. H., Manufacturers of a great variety of wood working Machinery, of the most approved style, simple construction, and effective and firm operation. To be found in the country; complete and perfect sets for making Railroad cars, docks, sash and blind, ship-building, bedsteads, cabinet, and carpenter work, &c. &c. Also, some machines of peculiar merit, such as for single and double Tenoning, capable of making from one to four tenons at the same operation of any width, size, or length, on large or small timber, with revolving cylinder attached. Also, an improved timber Planing Machine, with the addition of a side-cutter, with which the top and edge of timber or plank is planed, whether square or bevel, at the same operation, and in the same time occupied in planing but one side on all other machines. They also manufacture circular, single, and gang Saw Mills, Flouring and Corn Mills, hand and power Hoisting Machines for storehouses, Shafings, Haugers, Pullies, and Mill Gearing of all patterns.

MARTIN BUCK, J. H. BUCK, F. A. CUSHMAN, WM. DUNCAN.

AGENTS—R. L. Allen, 189 and 191 Water-st.; S. B. Schenck, 168 Greenwich-st.; Andrews & Jessup, 67 Pine-st.; Lawrence Machine Shop, 51 Broad-st., New-York, and Lawrence, Mass.; Leonard & Wilson, 60 Beaver-st., and Wm. F. Sumner, Crystal Palace.

FERTILIZERS.—Bone Dust, Guano,

Poudrette Plaster, and Super Phosphate, all warranted of the best quality. R. L. ALLEN, 189 and 191 Water-st.

LAWTON BLACKBERRY.—Genuine

Plants may be purchased of WM. LAWTON, No 54 Wall-st., New-York

FANCY FOWLS.—Shanghai Fowls—di-

rect importations—and Spangled Hamburgs, for sale by WM. DAY, Morrinstown, N. J.

Agricultural Implements.

AGRICULTURAL IMPLEMENTS.—The subscriber offers for sale the following valuable Implements:

FAN MILLS—Of various kinds, for Rice as well as Wheat, Rye, &c.

GRAIN DRILLS—A machine which every large grain planter should possess. They are of the best patterns, embracing several varieties and sizes, and all the most valuable improvements.

SMUT MACHINES, Pilkington's, the most approved for general use.

HAY AND COTTON PRESSES—Bullock's Progressive Power-presses, and several other patterns, combining improvements which make them by far the best in use.

GRAIN MILLS, Corn and Cob Crushers, a very large assortment and of the best and latest improved kinds.

GRAIN MILLS, STEEL and CAST IRON Mills, at \$6 to \$25, and Burr-Stone at \$50 to \$250, for Horse or Steam Power.

TILE MACHINES—For making Draining Tiles of all descriptions and sizes.

WATER RAMS, SUCTION, FORCE and Endless-chain Pumps; Leather, Gutta Percha, India Rubber Hose, Lead Pipe, &c.

CALIFORNIA IMPLEMENTS OF ALL kinds, made expressly for the California and Oregon markets.

DRAINING TILES OF ALL FORMS and sizes.

THRESHERS AND FANNING-MILLS combined, of three sizes and, prices, requiring from two to eight horses to drive them, with corresponding horse powers. These are the latest improved patterns in the United States.

SOUTHERN PLOWS—Nos. 10 $\frac{1}{2}$, 11 $\frac{1}{2}$, 12 $\frac{1}{2}$, 14, 15, 18, 18 $\frac{1}{2}$, 19, 19 $\frac{1}{2}$, 20, A 1, A 2, Nos. 50, 60, and all other sizes.

PLOWS—A large variety of patterns, among which are the most approved Sod, Stubble, Side-hill, Double-mold, Sub-soil, Lock Coulters, Self-Sharpener, &c.

CARTS AND WAGGONS—With iron and wood axles, on hand or made to order, in the best and most serviceable manner.

HAY, STRAW AND STALK CUTTERS of all sizes and great variety of patterns.

CORN SHELLERS—For Hand or Horse Power.

FARMERS AND MERCHANTS WILL find at my Warehouse every Implement or Machine required on a PLANTATION, FARM, or GARDEN. I would call attention to a few of many others offered for sale:

They are all free from that destructive malady, THE PEACH-BLIGHT, which has never existed in this locality.

Prices low, and a liberal discount to the trade.
New-Bedford, 1854.

17-68

THE HORSE, THE HORSE,

NOBLEST OF DOMESTIC ANIMALS.
And the one most frequently ill-treated, neglected, and abused. We have just published a Book so valuable to every man who owns a horse, that no one should willingly be without it. It is entitled,

THE MODERN HORSE DOCTOR,
and is from the pen of that celebrated English Veterinary Surgeon, Dr. GEO. H. DADD, well known for many years in this country, as one of the most successful scientific and popular writers and lecturers in this branch of Medicine and Surgical science. The Book which he now offers to the public is the result of many years' study and practical experience which few have had.

From the numerous and strong commendations, of distinguished men and the newspaper press, we select the following:
Extract from a letter from Hon. John H. Clifford, Ex-Governor of Massachusetts:

NEW-BEDFORD, May 11, 1854.

DR. DADD—Dear Sir: I hope your new work on the noblest creature that man has ever been permitted to hold in subjection—the Horse—will meet with that success which all your efforts in this direction so well deserve.

Your obedient servant,
JOHN H. CLIFFORD.

From Hon. Marshall P. Wilder.

BOSTON, May 13, 1854.

DR. DADD—My Dear Sir: I am greatly obliged to you for the valuable treatise, the results of your own investigations, which you have recently issued, hoping that it may meet with the patronage of a discriminating community.

I remain yours with great regard,
MARSHALL P. WILDER.

The "Modern Horse Doctor" by Dr. G. H. Dadd, is a manual of genuine science, and ought to be owned and studied on the score of humanity, as well as interest, by every man who owns a horse. [Boston Congregationalist.]

Dr. Dadd has had great experience in the cure of sick horses, and explains the secret of his success in this volume. [New York Tribune.]

The author of this work is well known as a most skillful veterinary surgeon. His book is based on the soundest common sense, and as a hand-book for practical use, we know of nothing to compare with it. [Yankee Blade.]

We know Dr. Dadd well, and are satisfied that he possesses most important qualifications for preparing such a book as this. [New-England Farmer.]

Messrs. Jewett & Co. have just published a very valuable work by Mr. Dadd, a well-known veterinary surgeon, on the causes, nature and treatment of disease, and lameness in horses. [Farmer's Cabinet.]

This is one of the most valuable treatises on the subject ever published; and no owner of that noblest of the animal race, the horse, should be without it. Especially should it be in the hands of every hotel and livery-stable keeper. To many a man would it be worth hundreds of dollars every year. [Independent Democrat, Concord.]

By far the most learned and copious work on the horse and his diseases we have ever seen. [N. Y. Evangelist.]

One of the greatest and most commendable qualities of this work is, it is practical and plain to the comprehension of those farmers and others for whom it is mainly designed. The course of treatment favors generally a more sanative and rational system of medication than that recommended in any previously existing works on farriery. No farmer or owner of a horse should be without this book. Stable-keepers, stage-proprietors and hackmen we believe would derive profit by having at least one copy hung up in their stables for use and reference by their stable men. [Daily News, Philadelphia.]

There is more common sense in this book than any of the kind we have ever seen, and farmers and owners of horses would find it a matter of economy to possess themselves of it. It will be of more service than the counsel of a score of ordinary doctors. [Albany Courier.]

We deem this decidedly the best and most reliable work on the "Cause, Nature, and treatment of Disease and Lameness in Horses," ever published. [Nantucket Inquirer.]

What we have read of this book induces us to regard it as a very sensible and valuable work; and we learn that those much more competent to judge of its value, have given it their unqualified approval. [Eve. Mirror, New-York.]

This book supplies a great desideratum which Skinner's admirable treatise on the horse did not fill. Every man may be his own veterinary surgeon, and with much greater safety to this noble animal, than by trusting him to the treatment of the empirical itinerants who infest the country. It is well illustrated, and should be purchased by every man who owns a horse. [Eve. Mirror, New-York.]

This is a book that should be forthwith put into the hands of all who own or drive horses, whether for the dray or gig, for the plow, omnibus or road, for hard service or pleasure. [McMakin's Courier, Phila.]

A good, clearly-written book, which should be in the hands of every man who has a horse whose illis his affection or his purse make it worth while to cure. [Bangor Mercury.]

It is a valuable book to those who have the care of horses. [Hartford Herald.]

This is a scientific, thorough and complete treatise upon the diseases to which one of the noblest of animals is subject, and the remedies which they severally require. [Troy Budget.]

He is not worthy to have a horse in his care who will not use such a work to qualify himself for his duties to this animal. [Commonwealth, Boston.]

Published by JOHN P. JEWETT & CO., Boston.
JEWETT, PROCTOR & WORTHINGTON,
Cleveland, Ohio.

For sale by all Booksellers. 50-63

HORSE POWERS THRESHERS AND

SEPARATORS.—The Endless Chain or Railway Powers of our own Manufacture, both single and double-gear, for one and two horses, which has never been equaled for lightness in running, strength, durability, and economy. They are universally approved wherever they have been tried.

Special Notices to Subscribers, Correspondents, &c.

SUBSCRIPTIONS can begin with any number, but it is preferable to begin with the 15th of March or the 15th of September, as a half yearly volume of 416 pages, with a complete index, begins on each of those dates.

Those wishing their papers changed from one office to another, should give the name, County, and State, of their old and new Post-office.

Postage is no higher paid at the office of delivery than if paid at the office where mailed, and as the "regulations" at the New York Post-office preclude us from paying by the quarter or year, it is useless for subscribers to send money for the pre-payment of postage, for we can not attend to paying postage fifty-two times a year for each subscriber.

In sending money it is advisable to make a note of the name, number, letter and date of the bills sent, and then inclose them in presence of the Postmaster. Give the Post-office, and the County and State. Write these very plainly.

Economical Arrangement to Furnish other Periodicals.

Arrangements have been made with several Publishers to furnish their periodicals in connection with the *American Agriculturist* at reduced prices. Read the following:

The *American Agriculturist* will be furnished

with Harper's Magazine, one year for	\$4 00
" Putnam's " " " "	4 00
" Knickerbocker " " " "	4 00
" American Medical Monthly " " " "	4 00
" Eclectic " " " "	6 00
" Little's Living Age " " " "	6 50
" National Magazine " " " "	3 50
" Dickens's Household Words " " " "	3 50

Address ALLEN & CO.,
189 Water st., New-York.

PUBLISHERS' ANNOUNCEMENT!

THIRTEENTH VOLUME OF

THE AMERICAN AGRICULTURIST,

THE LEADING WEEKLY AGRICULTURAL PAPER OF THE COUNTRY.

The American Agriculturist,

A weekly Periodical of 16 large quarto pages, making an annual volume of 832 pages of nearly double the size of those in the first ten volumes of the *Agriculturist*.

N. B.—The work is divided into two semi-annual volumes of 416 pages, each volume having a complete index.

It is beautifully printed with type cast expressly for it, and on the best of clear white paper, with wide margin, so that the numbers can be easily stitched or bound together.

A copious Index is weekly added, which will be fully amplified at the end of each half yearly volume, for the bound work.

COMPREHENSIVE IN ITS CHARACTER.

Each volume will contain all matter worth recording, which transpires either at home or abroad, and which can serve to instruct or interest the Farmer, the Planter, the Fruit-Grower, the Gardener, and the Stock-Breeder; thus making it the most complete and useful Agricultural Publication of the day.

CORRECT AND VALUABLE MARKET REPORTS.

The Markets will be carefully reported, giving the *actual transactions* which take place from week to week, in Grain, Provisions, Cattle, &c., thus keeping our readers *constantly and reliably* advised as to their interests. During the past year the knowledge obtained from these Market Reports alone, has saved our readers thousands of dollars, by informing them of the best time to sell or purchase.

SUCH A PAPER IS DEMANDED BY THE FARMING COMMUNITY.

The Publishers confidently believe that the Agriculturists of this country are becoming too much awake to the demands of their own calling, to be longer satisfied with the slow monthly issues of a paper professedly devoted to their interests, or to trust alone to the irresponsible extracts in a "Farmer's column," so popular just now in papers chiefly devoted to business, politics, or literature; and they look for the united support of all the intelligent Farmers of this country in their continued effort to furnish a weekly paper of high and *reliable* character, which shall be progressive, and at the same time cautious and conservative in all its teachings.

ESSENTIALLY AN AGRICULTURAL PAPER.

The *Agriculturist* will not depart from its legitimate sphere to catch popular favor, by lumbering up its pages with the silly, fictitious literature, and light, miscellaneous matter of the day; it has a higher aim; and a small part only of its space will be devoted to matters not immediately pertaining to the great business of Agriculture. The household as well as the out-door work of the farm will receive a due share of attention. The humbugs and nostrums afloat in the community will be tried by reliable scientific rules, and their worthlessness exposed. It is the aim of the publishers to keep this paper under the guidance of those who will make it a standard work, which shall communicate to its readers *only* that which is safe and reliable.

AN INDEPENDENT JOURNAL.

The *American Agriculturist* stands upon *its own merits*; and the truthfulness, zeal and ability which it brings to the support of the interests of the farmer. It is *untrammeled* by any collateral business connections whatever; nor is it the *organ of any clique*, or the *puffing machine* of any man or thing. Thoroughly independent in all points, its ample pages are studiously given alone to the support and improvement of the great Agricultural class.

EDITORIAL DEPARTMENT.

The *American Agriculturist* is under the joint Editorial supervision of Mr. A. B. ALLEN—its principal editor for the first ten years—and Mr. ORANGE JUDD, A. M., a thoroughly practical farmer and agricultural chemist.

They will be assisted by Mr. LEWIS F. ALLEN, an eminent practical farmer, stock breeder, and fruit grower; Rev. WM. CLIFT, and Mr. R. G. PARDEE, both widely known as pleasing and instructive writers on gardening and other departments of practical Agriculture, and, in addition to these, number of other eminent Agricultural and Horticultural writers.

THE CHEAPEST PAPER IN THE COUNTRY OF ITS CHARACTER.

The *American Agriculturist* is supplied to regular subscribers at a cost of less than FOUR CENTS a number, of sixteen large pages; and to large clubs for less than TWO AND A HALF CENTS. Each number will contain suggestions for the treatment of soils, manures, crops, stock, &c., which will often be worth to the reader more than the cost of the paper for a year.

SPECIMEN COPIES.

Specimen copies will be forwarded gratis to any one sending their name and Post-office address to the publishers.

TERMS, &c.—The paper will be promptly issued on Wednesday of each week, and mailed to subscribers on the following liberal terms:

To single Subscribers.....	\$2 00	A YEAR, \$2 00
" Clubs of 3 do.....	1 67	" 5 00
" " 5 do.....	1 60	" 8 00
" " 10 do.....	1 50	" 15 00
" " 20 do.....	1 25	" 25 00

The money always to accompany the names for which the paper is ordered.

The Postmaster, or other person sending a club of ten, will be entitled to one extra copy gratis.

The Postmaster, or other person sending a club of twenty or more, will be presented with an extra copy, and also a copy of the National Magazine, Scientific American, Weekly Tribune, or Weekly Times, or any other paper or periodical in this City, the cost not exceeding two dollars per annum.

Subscriptions may be forwarded by mail at the risk of the Publishers, if inclosed and mailed in the presence of the Postmaster.

Communications for the paper should be addressed to the Editors; Subscriptions, Advertisements, and all matters relating to the business department, should be addressed to the Publishers,

MULES—THEIR BREEDING—REARING—USES.

NUMBER 1.

Sixty years ago, as we learn from tradition, and forty years ago, as we saw in our boyhood, great numbers of mules were bred in New-England for the Carolina and West India markets. They went in droves to the Carolinas, and to the West Indies they were shipped in the trading brigs and schooners of that day, and sold to the planters; in return for which the vessels brought back rum, sugar, molasses, and coffee. The southern States paid chiefly cash for their mules; and out of the mule-trade those who followed it extensively, generally got rich; while the farmer who bred them considered himself well paid for the use of his mare or mares, which, beside doing up the horse-work of his farm, usually produced him a young mule, which, at the age of four months, brought him from twenty-five to forty dollars—jack-service thrown in.

The mules of that day were small, compared to the standard which is now demanded. Fourteen hands was about an average height; fourteen and a half hands was *prime*; fifteen hands was extraordinary; and one exceeding that height was a wonder in New-England. The jacks used at that day were snug, compact animals, such as would be discarded at once by the mule breeders at present. The best jacks were Spanish, which were frequently imported. They were best of medium size; yet, as now, possessed fine points, and proved excellent mule-getters.

The mares to which these jacks were bred were of moderate size, commonly from fourteen and a half to fifteen and a half hands high, compact, muscular, hardy animals, of the common Yankee breed of horses, accustomed to every-day work on the farm and on the road; a creature literally "of all work," but moderately fed, and most commonly in low condition compared with the generality of western horses; still, sufficiently well in flesh to do their work satisfactorily, on grass in summer, and hay in winter, with now and then a feed of oats for extraordinaries.

The mules bred from these mares, with such keep, were small, hardy, and, compared with the mules of the present day, inferior in style and quality; yet of great endurance and wonderful longevity, performing remark-

able feats of labor, and as full of all sorts of assinine vices when released from their drudgery as their nature could permit. So untractable were they for the labors of New-England farms, or for the road, (probably more from the want of proper management than any thing else,) that a mule-team in Massachusetts, or Connecticut, was as rare to be seen as a jackass is now in either of those States.

About the time of our last war with England the mule trade of the northern States began to decline, and down to as late a period as 1825, few mules were bred at all; while, for several years past, scarcely such a thing as a native mule is known in a single State east of Ohio. The principal cause of the decline in mule breeding at the North probably was, the interruption of the West India markets by the war, and the consequent decline in the cotton culture of the South, while, when the demand revived, the western States had commenced mule rearing in earnest; where, in the abundance of their food, by which they gained an earlier maturity and an increased size, these western beasts—particularly those of Kentucky—were so generally preferred at the South, that the northern mules ceased to hold a successful competition with them. The Yankee mule was, after taken from the mare, usually fed on little else but grass and hay, with occasionally a few oats, which, while it gave them more muscle and hardihood, they were later in arriving at maturity, and were not marketable before three years old, and unfit for severe labor till four. This was a further objection to them in comparison with the western mules, in which the western breeder had the great advantage of getting an apparently better beast to market a year in advance, and at a much lessened outlay of capital and keeping. Thus the mule-trade of the North declined in favor of the West, where it must for all future time probably continue, and in the loss of which our northern farmers need ever feel any regret.

So large and so fine a race of animals have the western mules become, that they are not only the universal laboring draught-animal of the planting States, but throughout the middle States they are rapidly supplanting the horse for the labors of the road, the heavy hauling for the factories, and the mines, the lumber-yards, the stone and lime quarries, the brick yards, the canals, and occasionally the heavy drudgery of the farm.

The mule is now—instead of the little ruf-

fian-looking beast of thirty to fifty years ago, fourteen to fourteen and a half hands high—fifteen and a half to sixteen hands high, and many even sixteen and a half to seventeen, at three and four years old; while those of the old-fashioned stock would be considered utterly contemptible in comparison—in fact they are scarcely bred at all, so far beneath the standard size and style are they considered.

An approved jack, for mule-breeding at the West, must now be fifteen and a half to sixteen hands high, stout-limbed, and good in his points. The larger and *finer* the mare bred to him, the better is the young mule considered, and the higher price will he bring. Indeed many mule breeders prefer a *thorough-bred* mare for mule-breeding, if she possess fair size, so much finer and more valuable are her produce among the mule dealers and fanciers. Thus a jack of great size and fine quality will command an enormous price, not only as a mule-getter, but many of the best are confined solely to jenny service, when proved superior sires of their own distinct race. Jenny's are bred of proportionate size, and of equal quality; and when found to be producers of superior stock, are exceedingly valuable for jack breeding.

Of the improvement made in ass and mule breeding within the last thirty years, in Kentucky and Ohio, we shall speak in a future number.

MR. HOLCOMB'S ADDRESS.

CORN STALKS FOR FODDER—ORNAMENTAL SHADE TREES.

MANY of our friends, in different parts of the country, have kindly favored us with a copy of an address, delivered before their several County, or State Agricultural Societies. We have not yet been able to read every one thus sent, and all who have remembered us in this way will please accept the general expression of our thanks. Some of these speeches are by men engaged in other professions than farming, and while interesting as literary essays, they are often deficient in practical information. Others are of a more useful character, and convey sound instruction.

Of the latter class we have read few better essays than the one delivered before the Montgomery County (Md.) Agricultural Society, by Chauncy P. Holcomb, of New Castle, Del. Mr. H. goes at once into practical details. We give two extracts from the first pages of the printed address.

VALUE OF CORN-STALKS FOR FODDER.

I cut up all my corn; after repeated experiments and much experience, I am satisfied it is the best way. It is better for the corn, it is infinitely better for the fodder. I should add that some few years back I wintered a hundred head of cattle, carrying them well through the winter on little beside the corn fodder from one hundred and forty acres of corn, for I do not take the straw largely into account, and I had not that season twenty tons of good hay in my barns. I annually winter my horses in great part on long fodder, nor is its length, when fed in cribs or rail mangers in the yard, any considerable inconvenience. We tie the fodder in bundles as we husk the corn, using rye straw, or broom corn stalks, and put it in bunches of a dozen or fifteen bundles, and haul as soon after husking as we can, and decidedly, then, the best way is to stack in the round stack. In cutting up the fodder you avoid all risk of danger from the weather. In topping and blading the risk to the blades, in bad seasons in particular, is very great. Corn may be cut up, and should be, as early as the blades can be safely pulled. In the case of the premium generously offered, in Talbot County, by that accomplished, intelligent, and zealous friend of agriculture, Edmund Ruffin, Esq., to ascertain which mode of saving fodder is least injurious to the corn, the very excellent report of Mr. Holliday, of that county, showed, according to my recollection, that corn cut up, not only lost less in weight than any other process of saving the fodder, but actually less than when it was left to stand on the stalk in the field until gathered. It may be convenient to have a few blades, and certainly it often is, but give me as a general rule the noble plant as it grew, robbed only of the grain, both for the stock and the manure-yard, as well as for the subsequent tillage of the field on which it grew. The difference between topping and blading and cutting up corn, would hardly be stated too strong by saying, it was the difference between insuring the capacity to winter a good herd of stock, and having some blades saved for the horses, the work-stock of the farm.

ORNAMENTAL SHADE TREES.

Our warm climate, and the length of our summers, render shade almost a necessity, and there is nothing with which a rural home can be embellished and set off to such advantage, and at so little expense, as with trees and shrubbery. Our native forests supply an abundant variety in the tulip poplar, the walnut, the ash, the beech, the elm, the cedar, and other varieties; while the common black-haw, cultivated as a shrub, would be mistaken on the lawn, from its delicate and beautiful foliage, for some plant of the tropics. The home and its surroundings give character to the estate, and are not without influence even upon the character of those who inhabit that home. Where homes are so cheaply made beautiful and pleasant, there is no apology for a nude, naked, exposed dwelling, the drapery of trees and vines, and shrubbery being as necessary and more beautiful than anything with which the house can be ornamented within. But this is all a truism, and has been repeated much more beautifully and impressively a hundred times before. Now, for the practical comment—for the rule that, if followed, will produce the desired results. Every year before beginning to plant corn, no matter what the exigencies are, let the proprietor say, "I must first plant my trees; my trees first, and then my corn," and taking his team to the forest a single day will suffice for "pitel-ing" this crop, including one or more trees to be set down at every cottage or tenement on the estate. He will be surprised to find how soon, adhering to his plan every year,

his grounds will become ornamented with beautiful shade trees, enhancing the value of his property five hundred per cent, beyond any actual expense, while giving him, at the same time, a delightful and pleasant home.

AGRICULTURAL AND COMMERCIAL VALUE OF RAILROADS.

THE Democracy, a journal recently established at Buffalo by an association of gentlemen, and conducted with a good deal of ability, publishes the following table and remarks illustrating the value of railroads.

Upon the ordinary highways, the economical limit to transportation is confined within a comparatively few miles, depending, of course, upon the kind of freight and character of the roads. Upon the average of such ways, the cost of transportation is not far from fifty cents per ton per mile, which may be considered as a sufficiently correct estimate for the whole country. Estimating at the same time the value of wheat at \$1 50 per bushel, and corn at 75 cents, and that thirty-three bushels of each are equal to a ton, the value of the former would be equal to its cost of transportation three hundred and thirty miles, and the latter one hundred and sixty-five miles. At these respective distances from market, neither of the above articles would have any commercial value, with only a common earth road as an avenue to market. But we find that we can move property upon railroads at the rate of fifteen cents per ton per mile, or for one-tenth the cost upon the ordinary road. These works, therefore, extend the economic limit of the cost of transportation of the above articles to 3,300 and 1,650 miles respectively.

Statement showing the value of a ton of wheat, and one of corn, at given points from market, as affected by cost of transportation by railroad and over the ordinary road.

	Transportation by railroad.		Transportation by highway.	
	Wheat.	Corn.	Wheat.	Corn.
Value at market.....	\$49 50	\$24 75	\$49 50	\$24 75

160 do. do.....	47 10	22 35	25 50	75
170 do. do.....	46 95	22 20	24 00	

How wonderfully does the railroad enhance the value of farming lands at a distance from market! American farms, generally speaking, are very far from market. Indeed, New-York is the market for the bulk of the northern agricultural products. Most English farms have a market nearly in sight of them. But ours are for the most part so far away, that railroads of long lines and long connections instantly double, treble, quadruple, and quintuple the worth of grain lands near where they run. This has been the case in Ohio, Michigan, Indiana, Illinois, Wisconsin, and Canada. The President of the Nashville and Chattanooga road has stated, that the increase in the value of a belt of land ten miles wide, lying upon each side of that line, was equal to \$6 50 per acre, or 96,000 for every mile of road, which cost the company only \$20,000 a mile. It has been calculated that the construction of the 2,000 miles of railroad in Ohio would add to the value of landed property in that State three hundred millions of dollars—that is, five times the cost of the roads, which was \$60,000,000. The country can stand bankruptcies that come through railroad enterprises, if it can stand any. Of all forms they are the least mischievous.

OUR FARMERS AND FARMING.

For the last half dozen years, no business in our country has paid so well as farming; and there is no class among us half as independent and prosperous as our farmers. Prices have been high, and, until this year, products large. The causes which have led to this state of things may be set down as permanent. The consumers are increasing, and will continue to increase, faster than the producers. The tendency of population to cities has been noticed for years, and gathers new strength with every new decade. A comparison of our census returns demonstrates this. Take the examples of Massachusetts, New-York and Pennsylvania.

In Massachusetts, from 1820 to 1830, the State population increased 16 per cent., while Boston increased 30 per cent. From 1830 to 1840, the State 21 per cent., Boston 52 per cent.; from 1840 to 1850, the State 34 per cent., Boston 46 per cent. The following table will show in our view how the case stands with the States we have named and the commercial emporiums of those States:

STATES.				
Years.	Mass.	N. Y.	Penn.	
From 1820 to 1830.....	16	39	28	
From 1830 to 1840.....	21	52	28	
From 1840 to 1850.....	34	27	34	

CITIES.			
Years.	Boston.	N. Y.	Phila.
From 1820 to 1830.....	30	65	44
From 1830 to 1840.....	52	55	37
From 1840 to 1850.....	46	63	44

The increase of population in New-York State, from 1840 to 1850, was 668,000. Of this increase, New-York had 204,000 and Brooklyn, Albany, Buffalo, Rochester, Utica, and Troy, had 132,000, giving an increase to these seven cities alone of 336,000 or more than half the whole increase in the State. Besides those mentioned, there are numerous other towns and cities in New-York; and if the whole were embraced in the calculation, it is doubtful whether the returns would show any increase whatever of the farming population.

Farming will undoubtedly be not only the surest, but, upon the whole, most productive business in which men can engage. There is no danger of its being overdone—looking simply at the market value of its products. The tendency of our population to cities is occasioned by a disgust of farming toil and its slow gains, which will still continue to drive Americans from the soil. There is not "excitement" enough in it to suit the genius and taste of our day. Farming is not the work of an hour or a day. Hardy frames, careless of exposure to heat and cold—well knit muscles and the farming skill acquired by years of laborious application to farm work—can not be improvised. They can be described and lauded in fine spun poems and glowing editorials, but can not be produced by any such contrivances of ingenious and busy brains. It is very easy for New-York editors, fluent of tongue and pen, to expatiate, column after column, upon the noble pursuit of agriculture, and to advise the surplus population of New-York city to move instant on the land. It is easy to imagine that a homestead act—a farm free for each of the "landless ones"—would immediately produce an exodus of all these "surplus" people. But these surplus people are gentlemen and ladies, four-fifths of whom would be as helpless "on the land" as babes just born, while the other fifth vastly prefer the luxury of loafing to plowing, sowing, reaping, and ingathering—noble and charming as these editors represent such occupations to be. An eloquent lawyer will address an agricultural society, and tell them to "venerate the plow." He will express his profound amazement at what he denominates the folly of parents who, thinking farming "ungenteel," seek employment behind the counter and at

professional desks for their darlings. At the same time, this eloquent lawyer, who is so in love with agriculture—for which he may perhaps really have an honest affection—will probably let all his sons follow the fashion, and troop after the rest of the flocks of Young America, into stores and offices. There is, indeed, no probability that there will be any check to the tendency city-ward. Relatively, our farming population will decrease. The number of consumers will increase relatively faster than the producers. Many of these consumers will be productive, while many of them will swell the rapidly growing idle ranks of our city populations. In any event, however, farming will be relatively a better and better business, year by year; and by far the most prosperous and happy of any class in the community will be those who have been fortunate enough to have been bred intelligent, but plain and hardy farmers.

[Credit Lost.]

NURSERIES USING LIME.

IN the Premium Essay on "renovating exhausted land," by Com. J. Ap. C. Jones, reported in the American Farmer, we find the following remarks upon manures, which contain several useful practical hints. Mr. Jones's location is in Fairfax Co., Va., and his entire practice is perhaps not the best for all other localities, but several of the suggestions here made are every where valuable.

What I have to record under this head, I will premise by endeavoring to correct two very prevalent errors in regard to *lime as a manure*.

First then, lime, practically speaking, is not of itself a manure, yet at the same time no soil, other than alluvial, annually flooded, can be certainly fruitful and *permanently productive*, that does not contain a due portion of lime in some form or other, to be absorbed by the rootlets of plants for the perfection of both straw and grain. I have known some curious blunders and detriment to the progress of liming, by the use of *lime as a manure in comparison* with strong putrescent manures; for instance, a shovelfull of each was, by a novice, put on the hills of alternate rows of corn. The result of such ill-judged experiment need not be told.

Another common error, and one little less fatal to the general use of lime as an auxiliary renovator, is that it must be applied in quantities so large as to interdict its use by most farmers who derive support entirely from an exhausted soil. I was a great sufferer under this popular error. When I commenced farming, there were but few, if any, *native* periodicals devoted exclusively to Agriculture, and adapted to the wants of our country, consequently, we had to look abroad for agricultural light, which, when received, was illy adapted to our resources, our climate, or our worn-out lands.

The English works with which we were most familiar, told us of liming by the 1, 2, 3, 5, and even 60 bushels per acre; and in Pennsylvania, where liming was first brought into much use in the United States, 40, 60, and 120 bushels per acre were generally administered.

I commenced with about 40 bushels per acre, and I have, occasionally, applied 60, and as much as 80 bushels; on one occasion. The result was highly satisfactory in each case, but the expense was entirely beyond the means of most farmers. Long experience and close observation have satisfied me that lime, in far smaller quantities than is generally supposed, may be applied in various ways and with great advantage. I had good results and lasting benefits from the

application of as little as 15, and even down to five bushels of freshburned lime per acre, mixed with three or four times its bulk of road scrapings, and even of virgin soil dug out of banks on the roadside, spread on grass lands in autumn. Lime thus neutralized by clay or earth forms a most valuable ingredient for making compost; indeed a single bushel of lime well mixed with ashes, dry earth and the like, to prepare it for sowing by hand, applied to one acre of wheat and harrowed in with it, on land destitute of lime, will have a very salutary effect in hardening the straw and producing well filled heads.

The mode of applying manures being a subject of such diversity of opinion among the best farmers, I feel some distrust in recording my own experience. Some plow it in as deep as they can, some shovel or harrow in, and some top-dress by spreading it on the surface, and particularly on grass lands, and there let it lie; some do these things in the spring-time, some in winter, and some at seed-time, and a few, *directly after harvest or mowing*.

The result of my own experience, after a fair trial of all the modes practised or recommended, is that manures should be kept near the surface within the reach of air, light, heat and moisture. There are some exceptions to this general rule, for instance, when rough manure is used in the drill (the best mode for raising Irish potatoes in the tide-water counties of Maryland and Virginia,) it must be buried deep; so too, when applied to the corn crop, it must be spread thick on the surface and deeply turned under.

This last practice I seldom pursue, now-a-days, and for two reasons; first, the difficulty and cost of hauling such a bulky article any considerable distance in spring time, before the ground has become settled after the alternate freezing and thawing of winter, and the great damage done to roads and fields traversed at such a season.

Moreover, I do contend, the opinions of many to the contrary notwithstanding, that the rough manure of the farm-yard, of a winter's accumulation, removed in March for the corn field, if suffered to remain in the yard, occasionally strewing plaster of Paris and sulphate of iron, (copperas) over it until more thoroughly decomposed by the genial heat of spring and early summer, although it might lose 50 per cent in bulk, one load of the thus concentrated manure would be equal as a fertilizer, to four of the rough mass in which it was found in March.

This is a subject of peculiar interest to the owners of large farms, say of 500 or more acres. Let any one count the cost of manuring ten acres of land for corn, which manure to be hauled 1,200 yards from the farm-yard, in the months of March and April, and he will find that he had better sell the extra teams he keeps for such hauling, and lay out their value in lime and some of the highly concentrated manures, than to continue the old practice.

I shall be asked how I expend or apply my home-made manures. I will tell you in as few words as I can. In the first place, I have, as the reader may remember, a standing farm-yard or cow-pen in which my cattle are penned every night, winter and summer. The pen is surrounded by stalls for the milk cows and work-oxen, while the young and dry cattle have shelters under which they retire at will. The center of the yard is concave, so as to retain all liquids that fall into it, while there is dry ground around and about, for the cattle to stand or lie down. This yard is abundantly littered with straw, corn-stalks, &c., from early autumn until late in the spring. Back of my horse-stables, there are close receptacles, where the horse-litter is deposited, morning and evening. This last manure is applied exclusively

to top dressing mowing grounds in early spring and autumn, but the best time of all is as soon after mowing as possible, although it be under the burning sun of July, or even August. This idea will, doubtless, startle many practical farmers, and professors of the art and science of farming, as much as it did me when first recommended by an eminently successful English farmer still living in this State. At first, I thought my friend was quizzing me, but he became so earnest, and entreated me so hard to try it, if with one load only, that I consented, and applied it on a piece of fresh-mowed timothy meadow, neither high nor low ground, and at the rate of only 5 cart-loads per acre. The result was a heavy second growth, equal to half the first crop, and when, in August, the part so dressed might have been mowed, the *stubble of the undressed portion was not hid by the after-growth*. The crop of the succeeding year was 20 per cent better than on land of the same quality top-dressed in the usual way and time.

Traveling in the State of New-Hampshire a year or so afterward, on a farm where was growing the best timothy I have ever seen in New-England, I saw wagons in August, hauling cured grass from the meadow to the barn, and returning with manure from the barn to the meadow! My farm-yard or rough manure is applied chiefly to the potato crop, planting at convenient seasons through the months of March, April and May. The fine manure or scrapings is worked into composts and applied to corn in the hills, to garden and field crops, such as ruta бага, beets, carrots, &c., and to oat and barley ground, sowed broad-cast and harrowed in, to buckwheat and turnips in July, and to rye and wheat at the time of sowing.

Having said this much about manures of the farm-yard, the practical farmer must choose his own time and method of using them, according to the circumstances in which he is placed.

Of all the concentrated natural and chemical manures now in general use by farmers and gardeners, Peruvian guano is decidedly the favorite. It may not always be so. It ought not now to be the case. That upon extremely poor lands, incapable of vegetable production without use of powerful stimulants, 200 lbs. of guano per acre will produce an astounding crop of wheat, &c., can not be denied; and if clover seed be sown with the fall crop, or on it, in early spring, a fair crop of clover may follow next year, if the season be favorable; and if that clover be well plastered and plowed down in June, and again plowed and seeded with rye or wheat in August or September, there will be an improved base to work on, by a regular rotation such as I have already laid down, which must be pursued, or the benefits of the guano will be lost, and the land will be in a worse condition than ever. But guano should not be applied the second time to the same land, unless in combination with other fine manures; nor should it ever be applied in its crude state to land that is in good heart, i. e., land that will bring thirty bushels of Indian corn, or 15 bushels of wheat per acre, without it; not but that guano on some such land might increase the product of both wheat and corn enough to pay for itself, but if it should, the soil will be robbed of its fertility, and will be left in a far worse condition than when the guano was first applied; at least, such have been my own results in its use, and such is the universal character of guano in Peru, as I there learned upon personal inquiry, from the mouths of all persons (with whom I conversed) engaged in gardening and agricultural pursuits around the city of Lima, the capital of Peru, from whence we obtain the best guano. I have frequently been in Peru, first in 1825, again in 1842-3,

and more recently in 1848, and on each and every occasion, I took the greatest pains to obtain all possible information as to the value of guano as a manure, and the mode of applying it to field and garden culture, as well as to its effect upon the land, and with one accord, and without a solitary exception, I was told that land stimulated by the use of guano, soon became utterly worthless, unless the stimulus was kept up by repeated applications. This was the reason assigned for so little use made of guano, where the cost of the article is merely nominal, not exceeding more than half what we willingly pay for leached ashes in the District of Columbia. Of all the concentrated manures for sale in our seaboard cities, crushed bone or bone-dust is undoubtedly the best; its effect on the soil is both prompt and permanent; at least, a single application made by me 15 years ago is still quite visible, although the ground has been heavily cropped ever since. I found that one bushel of crushed bone was equivalent to one double horse-cart load of good farm-yard manure. Forty such loads is the least that will enrich an acre of worn-out land sufficiently for a good crop of corn, hence at the present price of bone-dust, that manure is beyond the means of most farmers for the renovation of poor lands.

Considering lime as the only sure foundation to any good system of farming which may be adopted for the renovation of lands exhausted by injudicious culture, I will devote a few lines to that particular subject, by stating what I would do, if I had my work to go over again, and which, of course, I recommend to all other beginners in their efforts to improve worn-out lands.

First, then, when your land has been well broken up for corn in the spring of the year, spread on it from 30 to 60 bushels of dry slaked lime. If you are near enough to kilns to get the fine lime fresh drawn, and can get it on the land before it slakes, thirty bushels of that sort will be still better than the larger quantity slaked, but be very careful not to let your lime get wet before it is spread and harrowed in. If you are so remote from limekilns as to be able to haul only one load a day, it will be better to buy the fresh burned and best lump lime, because in that state it is much lighter, and when water slacked, will increase from three to four-fold. Such lime ought to be put under cover and slaked immediately with strong brine. Lime of the quality described, and treated accordingly, acts very promptly, mechanically as well as chemically; mechanically, in reducing stiff, rigid clay to a loose and friable texture, and chemically, by neutralizing acids unfriendly to vegetable production, and by combining with loose and light soils, they are rendered more adhesive and retentive of moisture; in other words, lime judiciously applied to stiff land renders it light, while it gives to lands too light, a firmer or more compact texture. This dogma, paradoxical as it may appear to many, is fully established by every brick chimney or stone dwelling in the land. All who build such houses know that lime and sand (the latter largely predominating in all light soils,) with water, are materials used by masons for the formation of mortar, which in a short time becomes as hard, if not harder than the bricks. It is also well known that if stiff clay or rich mould were to be used with lime for mortar instead of sand, that when dry, it would moulder away and become impalpable dust. Now with these plain truths before us, it is only necessary to apply smaller portions of lime to our lands according to their texture, and we can have stiff or light land as we may choose or will it.

Most writers on lime applied to agriculture, and many practical liming farmers too,

recommend doses of 50 or 100 per cent on the previous dressing, until you get up to 120 bushels per acre at the end of the 8th year. I have not done so, nor do I consider it absolutely necessary or always expedient at such short intervals. Better extend the time according to my cycle of six shifts, applying the lime to your corn land in any convenient quantity, not less however, than you commenced with; say 30, 40, up to 60 bushels per acre. Finally and emphatically, be it remembered, that if your land is naturally deficient in lime, that deficiency must, in some way or other, be supplied, or you never can reap the full benefit of manuring your crops; particularly wheat will be uncertain in quality as well as in quantity, without lime, however rich your land may be, and in time of drouth your crops of all descriptions may fail entirely, whereas, on judiciously limed land, similar crops under like circumstances, will escape almost unscathed.

FAIRFAX Co., Va., Oct. 1853. THOS. A. P. C. JONES.

WINTERING BEES.

THE successful wintering of bees is a subject of deep interest to apianians, in all climates; and various methods are necessary, according to the latitudes in which they are kept, the degree of cold to which they are subject, and the prevalence of deep snows, &c. In all localities where the snow seldom remains on the ground but a few days; say south of the latitude of the city of New-York, populous families require no especial winter protection, and a current of cool air passing under them, by having a front and rear passage-way, will cause them to remain in their hives unless it be very mild weather. If the hives be well shaded so that the rays of the sun can not fall upon the entrances, or passage-ways, but few bees will sally out when the ground is covered with snow, and perish as is the case, when no means are taken to prevent such a result. In other locations further north, where the weather is severe, and deep snows frequently cover the ground for months, a different method of management is necessary.

We have adopted several ways of wintering bees under such circumstances, and the best one, in our opinion, is to let the hives remain in their summer position, and protect them either by an outer hive, or by surrounding the hives by hay or straw. The outer hive is made to slip over that in which the bees are, to be let down on the same level as the hive proper, with a passage-way in front to correspond with that of the inner hive. The hay or straw covering is arranged as follows: The hives are first placed on low stools; say, from six to twelve inches high, if they do not rest on such stools permanently, and without changing their position, except by placing them nearer the ground than they previously stood. Stakes are then driven into the ground around them, two on each side of each hive, large enough to support the hay, and long enough to reach about four inches above the hives when driven into the ground. The hay is then stuffed around the hives on all sides firmly, and when complete, cover the tops of the hives with hay; then take strong twine and tie the tops of the stakes together, in order to hold the hay fast; then remove the hay from the passage-ways, so that the bees can pass out and in, and then place a board in front of each hive, to darken the passage-ways, and your work is done. An inch augur-hole should, however, be bored through the center of each stand, as the passage-ways are liable to become stopped up with dead bees during the winter, and cause suffocation if no such holes are made.

Bees managed in this way will consume but little food, will not suffer from the most intense cold, and will come out in the spring in a healthy condition. So says Mr. Miner, in the Northern Farmer.

COAL OF OHIO.

PROF. MANSFIELD has an article in the Railroad Record, entitled "The Coal Fields of Ohio, and Coal consumption of its cities," from which we draw some interesting facts:

Coal is cheaper at 20 cents a bushels than wood at \$3 a cord; also for manufacturing purposes, it costs more to build and keep a dam in repair, than to run a steam mill. Hence steam mills all over Ohio, alongside the streams that formerly furnished the power.

Ohio is estimated to contain a coal field equal in extent to twelve thousand square miles, or one-third the surface of the State. The eastern and southern boundary of the Ohio coal fields is the Ohio river; the western commences some ten miles above Portsmouth, and runs on a line a little east of north to the western line of Summit County. Within this limit are some counties, such as Fairfield, in which coal has not yet been found. It is nevertheless quite certain that coal underlies them, and probably at no great depth. The counties at present producing most coal are Meigs, Athens, Muskingum, Summit, Jackson, Jefferson, Trumbull, Tuscarawas, Belmont, Guernsey, Stark, Hocking, and Vinton. Besides these, coal is found in Gallia, Coshocton, Washington, Licking, Morgan and Carroll. The present amount of coal dug, including that consumed on the spot, is estimated at the following amount:

Counties.	Bushels.	Counties.	Bushels.
Meigs.....	8,000,000	Summit.....	4,000,000
Lawrence.....	2,000,000	Jefferson.....	1,000,000
Athens.....	1,500,000	Muskingum.....	2,000,000
Stark.....	1,000,000	Jackson.....	1,000,000
Belmont.....	1,000,000	Coshocton.....	500,000
Tuscarawas.....	500,000	Vinton.....	300,000
Licking.....	200,000	Washington.....	200,000
Morgan.....	100,000	Trumbull.....	500,000
Monroe.....	200,000		
Aggregate.....			23 800 000.

The above is probably an under estimate, and certainly will be for the future, in which the demand and supply will probably be doubled in the next two or three years.

The following is the amount of coal arrived, as near as we can ascertain, in the chief towns of Ohio:

Towns.	Bushels.	Towns.	Bushels.
Cincinnati.....	8,000,000	Cleveland.....	6,000,000
Columbus.....	1,000,000	Chillicothe.....	300,000
Circleville.....	200,000	Dayton.....	120,000

Other towns consume enough to make 20,000,000 bushels. The town population of Ohio will, in a half dozen years, amount to half a million, and this will require 15,000,000 for household consumption; while the foundries, factories and shops of various descriptions will require 25,000,000, independent of the furnaces and forges. We thus see, that independent of the coal consumed at the mines by furnaces, forges and other works, forty millions of bushels will be required in the towns, and this amount will be increased annually at a rapid rate.

WINTER GARDENING.—There are a few golden rules to be observed during winter, of which may be enumerated the following:

"Water all plants that require it in the morning; leave no water in the saucer of any plant after the whole has become saturated through; never water by drips, but give the whole a good soaking, or the consequence often is that the top of the mould is wetted, while the lower, containing the roots, is dust; sponge over the foliage as often as it becomes dusty; take a pointed stick, and, once in a while, stir the surface

of the soil, but not deep enough to disturb the roots; this acts the same part as hoeing in summer, and tends vastly to promote the growth of plants. Give each plant space enough for air to circulate around it, if possible; let it have the benefit of a little pure, fresh air at times."

THE FARMING BUSINESS.

THE independence, health, and comfort of a farmer's life in this country, if carried on with a tolerable degree of intelligence and spirit, is a subject of common remark. Our people, too, are generally aware that it may be considered the most *patriotic* of the professions—that the agricultural interest is the grand standard interest to the nation—that the science and capital put into it may be said to be loaned out for the public welfare—that as Republicans and Americans, we need nothing so much, and nothing so well becomes us, as the diligent, enlightened cultivation of the soil. From a neglect of these principles have arisen, essentially, a great part of our calamities in former years. We have become, especially our rising generation, impatient, impetuous, ambitious, "go ahead," that is the phrase which expresses in fact our greatest national fault and national curse at once. Hence the steady pursuits of our fathers are abandoned. They are too tame and slow. Hence the old farmer finds himself deserted by his sons, as soon as they are grown to man's estate, and generally much before. Hence the country is left comparatively to run to waste, while the cities and large towns are crowded with ill-bred, inexperienced, silly young fellows, who are all on the *qui vive* for rushing into trade and making a fortune at once. Others embark in it, almost without the tedious ceremony of apprenticeship or clerkship. Others migrate, and speculate in the South and West. Of all this miserable host, nine-tenths are ruined within two years from the time they leave home. The country is filled meanwhile with indolence, extravagance, and all sorts of desperate characters and irregular habits. This is *going ahead*. The old fashioned pursuits, the regular professions, the life one may lead in the country, are all too "slow." They are nothing like going ahead.

But we rejoice that the community is beginning to cherish more correct ideas on these matters, and is waking up to its real dignity and interest, and to those of the nation. Agriculture is rising in public estimation, its true value and respectability are beginning to be appreciated, and the time will soon come, if it has not already arrived, when it will be a proud thing to be a farmer; and a little experience, a little reflection shows that it is not merely the most comfortable, but a profitable pursuit—in the aggregate and in the long run, we mean. *Speculation* may turn out badly, but *cultivation* never need to fail. The soil may be depended on always, while the stocks can never—especially in a mercantile community so excitable, so political, and so dependent on extrinsic and occasional influences and operations as ours is. Nor is it the western soil only that will do. There is no need of our young men rushing out to Wisconsin, and Texas, and Minnesota, and Nebraska, and Oregon to find farms; or to California and Australia, to get possession of that, the love of which is "the root of all evil." They can find farms good enough for any praiseworthy ambition much nearer home. All New-England is good enough for their purpose, and by hard digging and plowing they may find gold. This running away to "seek a fortune" is merely a foolish notion. Our own country is the best country in the world, for our own people, at least. And what is more to the point, it is a fact, not generally known,

perhaps, that money can be made *here*. Look at our hills and valleys—they are the true El Dorado after all. Look at the gardening business on the lines of our railroads. Fortunes are made in this business by any one who chooses; and much more might be done if the business was properly followed up. But the whole country, the farming country, the remotest and rudest portion of it, are embraced within our remarks.

Boston Paper.

LARGE AND SMALL TREES.

WE have had some experience in transplanting both kinds, taken from the nurseries. There is no more risk in removing a pear or apple tree, four or five years from the bud, than one year from it. We are persuaded that we have lost three years by setting small trees where we might have set large. The large apple trees from Dyer's nursery, that we put out two years ago, have made as much wood as smaller ones. Some of them have blossomed, and the apples set both years, and as they are full of fruit-buds, we look for a sample of their fruit next season.

It may not generally be known that large sized apple trees, say two or three inches at the butt, cost no more than the smallest size. Nurserymen, if they have a large stock on hand, have no other resource than to cut and burn them, as they grow beyond the proper size for transplanting, so that they are glad to dispose of them at that price. Large pear trees, especially those upon quince, are most expensive. We have purchased some nine years old this fall, at two dollars each, and consider it much better economy than to pay fifty cents for trees, two years from the bud. They are as safely moved, and will soon bear abundantly. If any of our readers are about to set an apple orchard, we are confident they will find it for their interest to order large trees. Let them dig large holes and put in compost liberally, and they will soon have fruit. We have found the trees from the nursery of the Messrs. Dyer, of Brooklyn, uniformly good, and have never lost a tree of their growing. Their mode of culture gives a large mass of fine, fibrous roots, and with ordinary care the trees are sure to live. Judging from the samples sent us to order, tree planters in this vicinity will not do better than to take a trip to Brooklyn, or to send in their orders. As we pay for our trees in corn rather than compliments, our readers may consider this an unbiased opinion.

Norwich (Conn.) Examiner.

THE OREGON AND OTHER PEAS.

PANOLA writing to the American Cotton Planter, speaks of the Oregon pea as follows:

The Oregon pea, that magnificent humbug, has had its sway in South Carolina. Its career, however, was short. *One dollar a pint* will never be given again in this State for this prolific little pea. It has qualities to recommend it, but the same can with equal propriety be said of the common "Southern pea." Stock of all kinds, horses, cattle, hogs, and cows, will eat the pods and vines of the Oregon pea, but they will do the same with the other also. Horses brought from Kentucky, or any northern State, do not willingly eat either, but a little coaxing soon creates a voracious appetite for them. But they never will abandon the common pea for the Oregon pea. Ours is an equally productive pea, much more easily gathered, and properly prepared is as delicate an article of diet as any pea, let it come from a distance doubly as far as the savage wilds of

Oregon. I must admit, however, that there is one preference to be yielded to the Oregon pea, and that is, that it grows more luxuriantly on poor ground than any other vegetable matter. To say that it flourishes *best* on poor land is all humbug; but it may be said that in proportion it bears more abundantly on such land, for, if the land be rich it grows rapidly to a large weed, too coarse for fodder, and, unable to sustain its own weight, decays its fruit by its own shade, lying flatly on the ground. The pea is tedious to gather, and unless taken when moist with dew, or just as soon as it is ripe, it pops open like a touch-me-not when handled, and the greater parts of the seeds are lost. Seventy-five cents a bushel for the "Georgia Crowder," or "Shiney pea," is an hundred fold cheaper than one dollar a pint for the much-extolled "Oregon pea."

BIRDS EGGING IN THE PACIFIC.

A friend in San Francisco, who is somewhat given to the study of ornithology, writes us some very interesting and surprising facts in regard to an important trade carried on in the markets of that city in the eggs of sea birds. He states that the Farallones de los Frailes, a group of rocky islets, lying a little more than twenty miles west of the entrance to the Bay of San Francisco, are the resort of innumerable sea-fowl, known by the fishermen as "murre." These islands are almost inaccessible, and, with a single exception, are uninhabited. They, therefore, very naturally afford a resort for great multitudes of birds. Some time since a company was organized in San Francisco, for the purpose of bringing the eggs of the murre to market. An imperfect idea of the numbers of these birds may be formed from the fact that this company sold in that city the last season, (a period of less than two months, July and parts of June and August,) *more than five hundred thousand eggs!* All these were gathered on a single one of these islands, and, in the opinion of the eggers, not more than one egg in six of those deposited on that island was gathered. Our correspondent informs us that he was told by those families on the islands, that all the eggs brought in were laid by birds of a single kind. Yet they exhibit astonishing variations in size, in form and in coloring. There is no reason to suppose that he was misinformed in regard to these eggs being deposited by a single species. The men could have had no motive for deception, and similar facts are observable on the Labrador coast and in the islands north of Scotland. Besides, the writer ascertained from other sources, that all the eggs brought to the market were obtained from a limited portion of the island, known as the Great Fallaron—called the Rookery, where a single species swarm in myriads, and where no other kind of bird is found. Naturalists, in our Eastern cities, who have received specimens of these birds, pronounce them as Thickbilled or Brunnich's Guillemot, or Murre of Labrador and Northern Europe. The eggs are three and a half inches in length, and are esteemed a great delicacy.

SOMETHING NEW.—An invention which must become popular consists in a small padlock, with the owner's name engraved upon it, which is affixed to an umbrella in such a way that it can not be taken off, nor the umbrella opened. This, it is supposed, will guard against the stealing of umbrellas, and in this light will, if successful, be by some considered an infringement of natural rights.

Nothing so well becomes true feminine beauty as simplicity.

Horticultural Department.

HOVEY'S MAGAZINE FOR NOVEMBER.

THE visit of our cotemporary for this month was rather late; hence our delay. The article in the last number on "our neglected trees," is followed in the present by one on "our neglected shrubs." The writer deprecates the rage for novelties, and points us to the splendid shrubs which form so conspicuous a feature in our forests, and which are so highly prized and so extensively cultivated in the parks and pleasure grounds of Europe. The catalogue of popular sorts, such as the Snowball, Lilac, Syringia, Hon-ey-suckle, Althæa, and a few others, is altogether too short, and might profitably be increased by wild shrubs quite as hardy and beautiful.

The four principal plants which we have overlooked are, the Kalmia, (known popularly as High Laurel,) the Rhododendron, (known in some parts as the Buck Laurel,) the Azalea or Swamp-apple, and the Swamp Magnolia (*M. glauca*). To these may be added the Ledums, Andromedas, Rhodora, Vacciniums, Holly, &c. One of the most gorgeous sights of our New-England summer, is the High Laurel in full bloom, in localities where the shrub is abundant. Take such landscapes as may be found along the banks of Thames river, Connecticut, and its tributaries, in the month of June, and the handiwork of man is shamed in comparison with the unstudied grace and splendor of Nature. It is mainly because the plant bears transplanting with difficulty, that it is so seldom found around rural homes. It loves the shade, and is almost sure to die when taken from the woods and placed in an open yard. If transplanted young, and set in a copse, or in the shade of other trees, we think there would be less difficulty in making it live.

The Rhododendron is a larger shrub, has a larger and more beautiful flower, a tropical looking leaf, and is altogether rarer. In all our botanical rambles, we have never found more than two localities, in the State of Connecticut, and but one in Rhode-Island; and these are not extensive. It sometimes attains the height of fifteen feet, and when in flower makes a very beautiful object. Both this and the Laurel are successfully transplanted in the grounds of Asa Fitch, Esq., of Bozrah, Conn., and are very prominent among the shrubbery that adorns that beautiful home.

Wilson Flagg has a characteristic article on "Scenery and Rural Improvements in Western New-York." He takes occasion to differ from Edmund Burk, Price, and Downing, in their use of the terms *beautiful* and *picturesque*. He denies the distinction they have sought to establish, and claims that abrupt scenery may be beautiful, and rolling scenery, with regular waving lines, may be exceedingly picturesque. "There are no lines or figures which are exclusively picturesque—a word that is nearly synonymous with poetical or expressive—and which may, with equal propriety, be applied to the spires of a

Gothic cathedral, or to the domes of an eastern mosque. We leave this nut for the critics to crack. We apprehend, however, that Mr. Flagg lives one generation too late to correct a distinction in the use of these terms, which have become so thoroughly incorporated in the literature of rural art.

The editor accompanies an article on "the pruning of dwarf pear trees," with remarks, in which he approves of the system laid down by M. De Jonghe, of Brussels. The general course recommended in this system is, the removal of all shoots not required for the formation of a pyramid during the first flow of the sap, in the early part of the season; following this practice up by the pinching of laterals during the whole of the summer, and thereby simplifying the winter pruning, which is reduced to the shortening in of the leading shoots to a good eye. The aim seems to be to prune when the vigorous growth of the tree will heal all wounds that are made, and keep the bark smooth.

There is a description and an engraving of the Kenrick, the McClellan, and the King apples. The latter is thought to compare favorably with the Baldwin. Mr. Williams, of Newark, Wayne Co., New-York, an intelligent fruit-grower, says: "We cultivate several varieties of the New-England apple, such as the Baldwin, Roxbury Russet, &c., and the King is superior to them all in flavor; it is equal to the Swaar, and two or three times as large; the apple is one of the very handsomest in color. The trees are of the hardiest character, and bear every year, making a vigorous growth, even when loaded with fruit. They soon outgrow all other trees in the orchard." It will be recollected that there were magnificent specimens of this apple, both at our own and at the Connecticut State Fair, which attracted much attention. It promises to be an acquisition.

There are interesting editorial notes on the residence of D. F. Manrice, Esq., of Hempstead, L. I., and on the nursery of the Messrs. Hogg and Son, Yorkville. Mr. Manrice is now experimenting on the southern mode of making the strawberry a perpetual bearer, at least during the summer. He has a bed excavated and filled with prepared earth, and so constructed that he can irrigate at pleasure, or have it quite dry. Fruit-growers will await the result with interest.

J. F. Allen's work, on the Victoria Regia water-lily, is reviewed with commendation. The experiment of cultivating this magnificent plant is quite as successful at Salem as in England. The reviewer congratulates both author and artist upon their eminent success in their work.

In a notice of the proceedings of the Massachusetts Horticultural Society, it is announced that the vote of censure passed upon the Fruit Committee—which gave certain premiums to Messrs. Hovey & Co.—is rescinded unanimously. We are glad to see that the unhappy quarrel which has marred the peace and prosperity of this society is amicably settled.

A French gardener is said to have discovered that by painting his hot-houses with

coal tar—the refuse of the gas-house—all the insects so destructive to plants and fruits are destroyed.

THE GRAPE BLIGHT IN EUROPE.

FROM numerous sources we learn that there is reason to fear an almost total destruction of the vineyards throughout the greater part of middle and southern Europe. The disease spread over the country nearly a month earlier the present season than in any former year, and the grapes being younger, were less able to resist the attacks. A recent correspondent of the Evening Post, under date of London, October 31st, thus writes in regard to the cause of the disease:

The first attack I conceive to have been from without, and to have fallen upon the leaves and fruit in the form of very minute and (to the naked eye) invisible sporules or seeds, of a peculiar fungus or mycelium, formerly either unknown to, or not noticed by botanists, perhaps because its blasting and destructive powers were never before called into action. The vine being thus covered with these small fungi, the stomata, or breathing-holes, which are the lungs of the plant, have sucked in the sporules, which have thus been introduced into the sap vessels, and on the fall of the sap, in the autumn and winter, have with it been carried into the very roots of the tree, as well as lodged in the sap vessels of the new shoots and old wood.

The following spring, on the rising of the sap—that juice being full of the seeds of the fungi—the disease has shown itself in the new shoots and in the bloom-heads, and every infected vine has, in course, spread ruin around it in every direction, the spores or seed-pods ripening rapidly, and shedding thousands and millions of sporules, which, wafted by every breeze, settle on the neighboring vines; those which had escaped the first invasion of the disease now becoming its victims. Thus from year to year the evil goes on increasing, until the ruin and destruction become universal. The more frequently a vine has undergone the dire and weakening effects of the blight, the less capable does it appear of bringing its fruit to maturity—indeed, much of the bloom never sets.

After the most laborious experiments and investigations, in which I have had the assistance of clever and intelligent practical botanists and chemists, I can not refer the first attack to anything but atmospheric influences and disturbances, causing an unhealthy state of the vines, thus rendering them a fit prey to this fungus, (the seeds of which are floating in the air,) unable to resist its insidious attacks.

It would require that I should write a volume rather than a letter, were I to attempt to give a complete history of my experiments. I see in my brother's present letter a confirmation of my own experiences as to the new shoots and bloom-heads, absolutely bursting forth covered with oidium, and as to the unnatural exuberance as well as untimeliness of the shoots, which I also attribute to the peculiarities of the weather and seasons, and consider to be symptoms of the disease—indeed, symptoms not only dangerous, but harassing, as they tend to mislead—to create false and fleeting hopes, which, in a few weeks, must be dispelled by a sad reality.

A young shoot snapped off and exuding a drop of sap, that sap, falling on the ground, has been found full of the fungi. In order to elucidate my ideas of the progress of the disease through the shoots, wood, and roots

of the vine, I beg leave to inclose a plate taken from drawings sent to me from Oporto, to which I have the pleasure to refer you.

A very few words will suffice to sum up the probable result of the progress of the disease in vineyards, unless some effectual and cheap remedy should be discovered easily applicable to vines so grown, (in hot and greenhouses several remedies have proved more or less successful,) or that certain atmospheric changes and improvements should enable the vines to throw off the disease, viz:

The quantity of wine produced must go on rapidly diminishing every season, and the vine must gradually be exterminated. The farmer, when he finds himself year by year laboring in vain in his vineyard, will root up his vines and turn his attention to the cultivation of other things, (as is already the case at Madeira,) for he will clearly see that while he waits for such a change as I have mentioned, his capital will be dwindled away, if rich, and if poor, his family ruined and starved.

The blight has now at length attacked Spain, and arguing from analogy, its course will no doubt be the same. Already has the French government wisely permitted the entry of all wine into France duty free; thus the small stocks of other countries will be drawn into France. It is not long since a very nice, delicate old wine, or good, stout young port wine, could be shipped for £18 per pipe on board; now the same wine could not be shipped under £38 to £40 if young, or £50 if old. The shipment this year, to the end of September, is considerably less than in 1853 to the same period. Consumption going on and production diminishing, the result is clear—enormous prices, which will only be limited by their rising so high as to lessen the consumption very greatly. I have the pleasure to draw your attention to Mr. H. Harris's prices, assuring you that his stock, both at Oporto and here, is of a very superior quality, consisting of old wines for bottling, 1847's (now very rare to be met with,) 1851's, and a variety of other classes of wines.

There can not be a stronger proof of the impolicy of looking on when wines are rapidly rising, and there is no reasonable hope, indeed, scarcely a bare possibility, of any decline in price, than the fact, that those who have hesitated for the last few months, and now really require a supply, will have to pay fully £8 to £10 per pipe more, and my decided opinion is, that prices must continue to advance for a long period, even under the most favorable circumstances to which the most sanguine can look forward.

Your faithful, humble servant,
CHARLES HARRIS.

AGRICULTURE AND HORTICULTURE IN THE CANADAS.

We find in the last *Gardeners' Chronicle* the following article on the present and prospective condition of agriculture in the British Possessions in North America, which, we think, will convey to many readers much interesting information, and we transfer it to our columns:

If we turn to a map of the New World, and cast our eyes to the north of the United States, a vast tract of land will be seen stretching north to the regions of perpetual ice and snow, and east and west across the whole of the immense continent of America. This huge territory contains more than four millions of square miles, more than 2,630 millions of acres, and is equal to about one-ninth of the whole terrestrial surface of the globe. Nay, more, it owns the supremacy of our own sovereign Lady Queen Victoria,

and the *British Possessions in North America* are open to the energy and enterprise of Englishmen. If we examine a little more closely the south-eastern portion of the district in question, we shall find in Upper and Lower Canada a country with a healthy climate and immense resources, highly prosperous and rapidly increasing in population and importance. *The census of the Canadas*, published last year in Quebec, furnishes the materials from which we select the following facts in support of this statement. We confine ourselves more particularly to such details as bear upon agriculture and gardening.

The two Canadas consist, together, of an area of 242,482 square miles and 155,188,425 acres; of these last 7,300,839 are occupied and cultivated. The population is 1,842,265; so that there are, or rather were in 1852, four cultivated acres to each inhabitant; 164,488 persons, or a little more than one-eleventh of the whole population, are returned as farmers, while only 141,949 are returned as laborers; so that, even supposing that by laborer is always meant agricultural laborer, there are actually 22,539 farmers more than there are laborers. This is in striking contrast with the condition of our own country. England and Wales, as appears from the census of 1851, contain an area of 58,320 square miles, and 37,324,915 statute acres. The population is 17,927,609; so that upon the whole there were, in 1851, little more than 2 acres to a person, or half the quantity which exists in Canada; indeed, even less than that, for the acreage of England and Wales, as given above, includes the uncultivated as well as the cultivated land. With respect, again, to our agricultural population, it appears there are in England and Wales 225,318 farmers, who employ 665,651 laborers, so that, instead of there being, as in Canada, fewer agricultural laborers than farmers, there are nearly three times as many of the former as of the latter. But from the list of occupations in the English census, out of the entire population of Great Britain, amounting to nearly 21 millions of persons, one million are set down as agricultural out-door laborers; so that, although as compared with the farmers the number of laborers in England and Wales is much greater than in Canada, still, as compared with the whole population, the reverse is the case, for here only one person in 21 is an agricultural laborer, while there one person in every 13 is so. We confess that we should have thought that there had been more than three agricultural laborers for every farmer in England and Wales; but from a table in the English census it appears that as many as 91,698 returned themselves as farmers employing no laborers, and more than 33,000 as employing only one; these large numbers of course materially affect the average.

Leaving agriculture for the present, and turning our attention to horticulture, we find that in Canada (Upper and Lower) there are only 421 gardeners and 42 horticulturists, florists, nursery, and seedmen taken altogether. In Lower Canada there are fewer persons of this description than in Upper Canada, and it seems somewhat surprising that except in Montreal and Quebec there should not be a single nursery or seedsman throughout the whole of the former province, and that for the same district only one person should be returned as a horticulturist, and absolutely none as a florist. When it is remembered that the area of Lower Canada is nearly 210,000 square miles, and that its population is 890,000 persons, it does seem strange that only 149, or 1 in a little less than 6,000 should be found making gardening and horticulture the business of their lives. Compare this with Great Britain. The population may be taken at 21 millions,

and of this number 80,946 (we may say 81,000) are returned as gardeners, exclusive of 5,000 who are also domestic servants, and exclusive of 2,675 nurserymen and of 1,156 seedsmen. In England, Wales, and Scotland, therefore, there is one non-domestic gardener to every 260 inhabitants; or, in proportion to the population, 23 times as many as in Lower Canada. In upper Canada there are, both absolutely and relatively, more gardeners, &c., than in the lower province; in the former, with a population of 952,000, there are 314 gardeners, florists, &c.; that is to say, there is one to every 3000 inhabitants; or, in proportion to the population, twice as many in Lower Canada. Canada is not the place for luxuries; in the upper province there are only 94 barbers and hairdressers, or one to every 10,000 persons; and in the lower province there are only 30, or one to every 26,000; on the other hand, if we turn to the useful and necessary branches of industry, we find 10,268 carpenters, 7,075 blacksmiths, and 8,967 boot and shoe makers.

The Canada census contains some very interesting returns relative to the agricultural produce of the country. From them it appears that in both provinces together there are 1,136,311 acres of wheat, yielding in Upper Canada 16, and in Lower Canada 9 bushels per acre, and 13 and 3 bushels per individual respectively. There are nearly 78,000 acres of rye, yielding on an average 11 bushels per acre; 329,755 acres of peas, yielding in Upper Canada 14, and in Lower Canada 9 bushels per acre; 913,356 acres of oats, yielding as before 26 and 20 bushels per acre; and 65,650 acres of barley yielding on an average 21 bushels per acre. Barley is the only crop which it appears from the returns is yielded in greater quantities per acre in Lower than in Upper Canada. Wheat is in the tables valued at 4s. the bushel; rye at 2s. 6d.; barley at 3s.; oats at 1s.; and hay at 40s. per ton. Horses are estimated at £12 10; milk cows at £3 15; oxen at £6; sheep at 7s. 6d.; swine at £1.

A rapidly increasing population is always admitted to be a sure sign of prosperity, and we can not conclude the present article better than by the following facts relating to this subject. In the 10 years ending in 1851, the population of Great Britain increased more than 13 per cent, that of the United States more than 35 per cent, and that of Upper Canada more than 104 per cent. In the far west of Canada, the Counties of Huron, Perth, and Bruce increased from 5,600 in 1841 to 37,580 in 1851, being upward of 571 per cent in 10 years—an increase almost beyond comprehension. England has in the average 332 persons to a square mile; Wales, 136; Scotland, only 92; while Upper Canada has 29; Lower Canada, 4; and the United States 16; so that the land even now occupied in Upper Canada would hold more than 11 times its present population, say 11,000,000 inhabitants, to be as densely peopled as England. In fact, about two-thirds of the population of London alone may be taken to represent the number of persons in all Canada.

Strawberry beds should be mulched, and tender raspberries laid down and protected. So should bulbs and flower-beds generally.

VARIOUS animals lend their mite to make up English words—for example: Man-agement, dog-matism, cat-egory, ero-nology, pus-illanimous, duc-tility, and rat-ification.

THE man who lives in vain, lives worse than in vain. He who lives to no purpose, lives to a bad purpose.

American Agriculturist.

New-York, Wednesday, Nov. 29.

INTERESTING TO OUR SUBSCRIBERS.

A CHANCE TO FILL YOUR LIBRARIES WITH VALUABLE BOOKS WITHOUT EXPENSE.

Four numbers more will bring us to the commencement of a New Year, and although our volume does not begin at that time, it is a favorable season for enlisting new subscribers, and, as heretofore, we shall look for large accessions. Many of our present subscribers have promised us clubs of five, ten and twenty at that time. While our agents here and there can do something, our great reliance is upon the individual exertions of those who have read the *American Agriculturist* for a season, and can testify as to its merits. Every person can influence one or more of his friends and neighbors to subscribe; but as this takes some time and effort, we are willing to remunerate such effort, and we therefore make the following offer of premiums for obtaining new subscribers.

N. B.—The books offered are not "old stock," but are the latest editions of standard works, fresh from the hands of the publishers, and they will be DELIVERED FREE OF POSTAGE OR OTHER EXPENSE.

The premiums will be paid as fast as the subscriptions are received at any time before the first of January next.

Subscriptions may begin at any time.

It will be seen that this offer does away with all uncertain competition—every one will be thus paid for whatever successful effort he may make, if it be only the procuring of one new subscriber.

PREMIUM NO. I.

To every person forwarding us one new subscriber, with \$2, we will send, post paid, any TWO copies of the following books in the first division:

FIRST DIVISION.—1, The American Kitchen Gardener; 2, Wilson on the Culture of Flax; 3, Dana's Prize Essay on Manures; 4, Elements of Agriculture, by Skinner; 5, Topham's Chemistry Made Easy; 6, Leibig's Agricultural Chemistry; 7, Leibig's Animal Chemistry; 8, The Horse, by Richardson; 9, Horse's Foot, and How to Keep it Sound, by Miles; 10, Milburne's Cow; Dairy, Husbandry, and Cattle Breeding; 11, Knowlson's Cattle Doctor; 12, Richardson on the Hog; 13, Domestic Fowls, by Richardson; 14, the Poultry Breeder; 15, The American Fowl Breeder; 16, The Hive and Honey Bee, by Richardson; 17, Phelps's Bee Keeper's Chart; 18, Every Lady her own Flower Gardener; 19, Richardson on Dogs; 20, Johnston's Catechism, by Norton.

Or one copy of any of the following:

SECOND DIVISION.—1, Bridgeman's Kitchen Gardener's Instructor; 2, Schenck's Gardener's Text Book; 3, Hoare on the vine; 4, Bridgeman's Fruit Cultivator's Manual; 5, Chorlton's Cold Grapery; 6, Buchanan on Grape Culture; 7, Pardee on the Strawberry; 8, Cole's American Fruit Book; 9, Elements of Agriculture, by Skinner; 10, Da-

vis's Text Book of Agriculture; 11, Norton's Scientific Agriculture; 12, The American Veterinarian, by Cole; 13, American Pocket Farricr; 14, Guenon's Milk Cows; 15, Nefin on Milk Cows; 16, Weeks on the Honey Bee; 17, The Cottage and Farm Bee Keeper; 18, American Rose Culturist; 19, Browne's American Bird Fancier.

PREMIUM NO. II.

To any person furnishing two new subscribers, with \$4, we will send twice the amount named in No. 1, or, instead thereof, we will send free a copy of any of the following books:

American Farm Book; The American Poultry Yard; Buist's Kitchen Gardener; Stockhart's Chemical Field Lectures; Beatty's Southern Agriculture; Allen on the Grape; Thomas's Fruit Culturist; Dana's Muck Manual; Johnston's Elements of Agricultural Chemistry and Geology; Blake's Agriculture for Schools; Hind's Farriery and Stud Book, by Skinner; Stuart's Stable Economy; Practical Farrier, by Mason; Allen's Domestic Animals; Evan's Dairyman's Manual; Dadd's American Cattle Doctor; Youatt and Martin on the Hog; Canfield on Sheep; Youatt on Sheep; Morell's American Shepherd; Miner's Domestic Poultry Book; Bennett's Poultry Book; Quinby's Mysteries of Bee Keeping Explained; Miner's American Bee Keeper's Manual; The American Florist's Guide; Buist's Rose Manual; Breck's Book of Flower's; Book of Caged Birds; Marshall's Emigrant's Guide.

PREMIUM NO. III.

To any person forwarding us three new subscribers, with \$6, we will furnish the Premiums No. 1 and 2, or one copy of either of the following:

Blake's Farmer at Home; Bridgeman's Young Gardener's Assistant; Johnston's Dictionary of Modern Gardening; Elliott's American Fruit Grower's Guide; Guide to the Orchard, by Lindley; Neill's Fruit, Flower and Kitchen Garden; Downing's Fruit and Fruit Trees of America; Barry's Fruit Garden; Browne's American Field Book of Manures; Ruffin's Calcareous Manures; Leibig's Complete Works; Youatt on the Structure and Disease of the Horse; Youatt and Martin on Cattle, by Stephens; Farmers' Barn Book; Randall's Sheep Husbandry; Langstroth on Bees; Buist's American Flower Garden Directory; American Rose Culturist; London's Lady Companion to the Flower Garden; Allen's Rural Architecture; Smith's Landscape Gardening; Wheeler's Rural Homes; Youatt on the Dog; Evan's Sugar Planter's Manual.

PREMIUM NO. IV.

To any one furnishing FOUR NEW SUBSCRIBERS, with \$8, we will send Premiums No. 2 and No. 3.

PREMIUMS FOR CLUBS.

To any person forwarding a club of three, five, ten, or twenty subscribers, at the usual rates for clubs, we will, for each new subscriber contained in the club, send any one of the first 19 books named in Premium No. 1.

The books in the First Division of Premium No. 1, are well bound in paper covers; the others are in the usual style of binding books.

WESTERN CORN CROPS—PORK OF THE YEAR.

Remarkable as our country west of the Alleghanies is for the production of Indian corn, few people are aware of its true capacity for growing that all-important article. For example: the premium crop of corn at the Bourbon County Exhibition in 1853, in an entire field of *sixty* acres, was thirty-five barrels, or 175 bushels to the acre! Yet so severe was the drouth the present year, that, on the same field, and with equally good cultivation, the owner of it offered his whole crop to any one who would pay him for *thirty-five bushels* per acre, instead of that number of barrels, as last year.

During several days that we traveled in the western States the past autumn, in which we had intercourse with many intelligent farmers, we came to the conclusion that, taken altogether, the crop of corn is about two-thirds an average one. In some sections it was quite as good as usual; in others the yield was half to two-thirds of a crop; while in some extreme localities it was not to exceed one-fourth to one-third the usual rates. There was, however, perhaps quite one-fourth of the last year's crop left over, which, added to the new, makes a very tolerable supply, and will carry our western farmers very comfortably over to the next harvest.

There will be much less *corn-fed* pork this year than last. But the quantity of hogs is greater than ever before, and the supply of pork will be large, but of not so good quality as usual. Acorns, hickory and beech nuts, will do a vast deal of the hog feeding. The mast (nuts) in the woods has never been more abundant, and innumerable numbers of swine have been driven into them for feeding. Many extensive pork raisers told us that they should sell more pork than ever, and without feeding a bushel of corn to their hogs! It will be thinner and lighter than if corn-fed; but, if properly cured, still a tolerable article; while the hams, shoulders, and bacon, will be palatable and fine.

THE NEW-ENGLAND FARMER, heretofore published by Messrs. Raynolds & Nourse, is hereafter to be published by Mr. Joel Nourse, one of the partners of the well-known firm of Ruggles, Nourse, Mason & Co., Manufacturers of Agricultural Implements. We learn from the publisher's notice, that the editorial arrangements will continue as before. We are glad to learn this, as we have ever considered the Farmer one of our best exchanges. We trust the Lieutenant Governorship, to which he has just been elected, will not turn the attention of Mr. Brown, the present editor, altogether from Agriculture. We are sorry he has stooped from the dignity of his profession to meddle in politics. He would scarcely have done it had he not recently too intimately associated with those who *Know Nothing*.

"AN OLD SUBSCRIBER" is informed that for very cogent reasons we do not answer any anonymous communications. If he has been a subscriber during the past ten months, he can scarcely have failed to read in our col-

umms (NEW SERIES Numbers 27 to 30,) one of the most complete articles on cranberries yet published in this country. His questions are there answered in full we believe.

WANT OF EMPLOYMENT—GREAT DISTRESS IN CITIES.

So many laborers and mechanics are now out of employment in our cities and towns, that great distress already exists among them; and this is constantly increasing by the daily suspension of various enterprises which were undertaken in more prosperous times. To aggravate their sufferings, a long winter is before them; provisions, fuel and house-rent are exorbitantly high; and pecuniary difficulties have overtaken thousands of our most enterprising and active business men, rendering it impossible to get up any new employment with a view of assisting them. In fact so far from commencing new operations, the great majority are obliged to curtail the old; and too many, we regret to add, have closed their work-shops entirely, for an indefinite time. We fear there will be almost as much suffering among laborers and mechanics the present winter, as there was in that of 1836, '37 and '38.

Many a worthy laborer and mechanic we fear will have to draw upon his precious little savings to carry him through the coming winter, while others not so provident or fortunate, must depend on charity for a precarious existence. Who will volunteer now to assist their brethren in distress by giving them useful employment? We look to the agricultural class with more hope than any other. They have gained largely by the high price of provisions and the enterprise of mechanics and others. Let them now cast about to see what they can do in the way of improving their lands, their buildings, their implements, &c., this winter, to give employment to those who would willingly work if they could find anything to do. We are certain they will not soon find hands so plenty, nor wages so easily paid for in the produce of their land as now.

We shall be highly gratified to receive suggestions and communications from farmers on this subject for publication, and let these be as practical and immediate in their operations as possible. We do not care about their going into the origin of these troubles, as they are unhappily too apparent to us all. Extravagant importations and living—too many railroad enterprises—speculations in land and buildings—together with a partial failure this year in the corn and cotton crops &c. &c.

WHEAT FROM CALIFORNIA.—A recent California correspondent states, that an effort was being made among the large wheat growers, to charter a clipper ship, and load her with 50,000 bushels of wheat and barley for New-York. It was thought that after paying freight and charges of about one cent per pound, there would be a small margin still left for profit.

SOME descendant of Solomon has wisely remarked that those who go to law for damages are sure to get them.

INDIAN LEGEND—THE ORIGIN OF CORN.

BY MINNIE MYRTLE.

In looking over various books concerning Indian literature, I have found two or three legends connected with the origin of corn and other vegetables, which will not be likely to fall under the eye of general readers without my assistance, and which I have thought worth transcribing. They sound very much like the fairy tales, to which we have all loved to listen in childhood, and are worthy a place among the fables of any people.

MANDAMIN;
OR

THE ORIGIN OF INDIAN CORN.

A poor Indian was living with his wife and children in a beautiful part of the country. His children were too young to give him any assistance in hunting, and he had but ill luck himself. But he was thankful for all he received from the forest; and although he was very poor, he was very contented.

The eldest son inherited the same disposition, and had been ever obedient to his parents. He had now reached the age at which it is proper to make the initial fast, which the Indian lads all do at about fourteen or fifteen. As soon as the spring arrived, his mother built him a little fasting lodge, in a retired spot, where he would not be disturbed; and, when it was finished, he went in and began his fast.

He amused himself a few mornings by rambling about in the vicinity, looking at the shrubs and wild flowers—for he had a taste for such things—and brought great branches of them along in his hands, which led him often to think on the goodness of the Great Spirit, in providing all kinds of fruit and herbs for the use of man. This idea quite took possession of his mind, and he earnestly prayed that he might dream of something to benefit his people, for he had too often seen them suffering for want of food.

On the third day he became too weak and faint to walk about, and kept his bed. He fancied, while thus lying in a dreamy state, that he saw a handsome young man, dressed in green robes, with green, waving plumes on his head, advancing toward him.

The visitor said: "I am sent to you by the Great Spirit who made all things. He has observed you. He sees that you wish to procure a benefit to your people. Listen to my words, and follow my instructions."

He then told the young man to rise and wrestle with him. Weak as he was he tottered to his feet and began, but after a long while the handsome stranger said: "It is enough for once. I will come again." He then vanished.

On the next day the celestial visitor reappeared, and renewed the trial. The young man knew that his physical strength was even less than the day before, but as his strength declined he felt that his mind became stronger and clearer. Perceiving this, the stranger in plumes again spoke to him. "To-morrow," he said, "will be your last trial. Be strong and courageous; it is the only way in which you can obtain the boon you seek." He then departed.

On the third day, as the young faster lay on his pallet, weak and exhausted, the pleasing visitor returned, and as he resumed the contest he looked more beautiful than ever. The young man grasped him, and seemed to feel new strength imparted to his body, while that of his antagonist grew weaker.

At length the stranger cried out: "It is enough; I am beaten. You will win your desire from the Great Spirit. To-morrow will be the seventh day of your fast, and the last of your trials. Your father will bring you food, which will recruit you. I will then visit you for the last time, and I see that you will prevail. As soon as you have thrown me down, strip off my garments and my waving plumes, and bury me on this spot. Come often to the place, and keep the earth clean and soft. I shall soon reappear, with all the wrappings of my garments and my waving plumes. Once a month cover my roots with fresh earth. By following these directions your triumph will be complete." He then disappeared.

The next morning the youth's father came with food, but he asked him to set it by, for a particular reason, till the sun went down. Meanwhile the sky-visitor came for his final trial, and though the young man had not partaken of his father's food, he engaged in the combat with his visitor with a feeling of supernatural strength.

He threw him down, and then stripped off his garments and plumes. He buried his body in the earth, carefully preparing the ground, and removing every weed; and then returned to his father's lodge. He kept every thing to himself, revealing nothing to denote his visions or trials. He partook sparingly of food, and soon recovered his perfect strength. But he never for a moment forgot the burial-place of his friend. He carefully visited it, and would not let even a wild-flower grow there.

Soon he saw the tops of the green plumes coming out of the ground; at first in spiral points; then expanding into broad leaves, and rising in green stalks, and finally assuming their silken fringes and yellow tassels.

The spring and summer had now passed, when one day towards evening he asked his father to visit the spot where he had fasted. The old man stood in amazement! The lodge was gone, and in its place stood a tall, graceful and majestic plant, waving its taper leaves and displaying its bright-colored plumes and tassel. But what most attracted his admiration was its GOLDEN EARS. "It is the friend of my dreams and visions," said the youth.

"It is MANDAMIN; it is the Spirit's grain," said the father.

And this is the origin of Indian Corn!

THE THREE SISTERS.

The Spirit of Corn, the Spirit of Beans, and the Spirit of Squashes, were regarded by the Indian as the special gift of the Great Spirit; and that each was entrusted, for the benefit of the Indian, to a separate Spirit. They give them the forms of beautiful females, and represent them as loving each other and delighting to dwell together. This affection is manifested by the clinging of the

vines to each other, and their being nourished by the same soil, and often springing from the same hill.

The maidens are supposed to be clothed with the leaves of the plants, each with the one over whose growth she presides, and all summer they are supposed to dwell among them. They have no separate names, but are called *De-o-ha-ko*, which signifies, "Our life—our supporters."

Corn, they say was once of easy culture, yielded abundantly, and had a grain very rich with oil. But the Evil Spirit being envious of this great gift to the Red man, went forth into the fields and spread over it a universal blight. Since then it has been harder to cultivate, produces not so abundantly, and has lost its original richness. When the rustling wind waves the corn-leaves with a moaning sound, the pious Indian fancies that he hears the Spirit of Corn, in her compassion for the Red man, still bemoaning with unavailing regrets her blighted fruitfulness.

GIVE US FEMALE PHYSICIANS.

THE article below is from the N. Y. Daily Times of 20th inst., probably from the pen of Dr. Tuthill, a leading editor of that paper, and himself a skillful and successful practicing physician. If females can not study medicine thoroughly, then "throw medicine to the dogs," and give us the genial *care* of woman. We have attended a course of medical lectures; and judging from our own observation, would much prefer to entrust our lives to a good-hearted old lady, (or young one as for that,) with her "arbs" and soothing watchful solicitude, than three-fourths of the youngsters who spend twice sixteen weeks, nominally as medical students, but really as wild, drinking, gambling boys, and then go out and hang forth their signs with an M. D., and assume charge of the health and lives of others. We have a high regard for medical science, and would only entrust ourselves in the hands of the best educated physician within our reach; yet from what we know of the medical students in this city, and elsewhere, we think there are but very few *educated* physicians. We especially endorse what is said in regard to the importance to woman of a knowledge of chemistry. The Times editor says:

There is a learned profession now in the hands of men which we are inclined to think women will shortly share with them, taking, indeed, the better half to themselves. We mean the medical profession. We have already seen young women going through the studies and getting the diplomas of that science; and the founding of female medical colleges is spoken of from time to time in the journals. In a late paper we have seen that, at Richmond, in Virginia, they are about building an expensive establishment of the kind. These things give evidence of what promises to be one of the best innovations of the age—one founded upon common sense and common feeling.

Women are the fittest physicians for women. Reason gives them, at one stroke, one half of creation to begin with; and then throws in, along with this grand division, all the little ones of the family of man. We assume that a woman can master all the

science and mystery of the healing art as well as a man—though, probably, in the matter of epic poetry, mathematics, statesmanship, or military strategy, she may be obliged to admit an inferior capacity of mind. Medicine is not so very deep and difficult a thing. Care and common sense are, after all, the grand principles of successful practice in the management of the human constitution; and these qualities belong as much to the women as to the men. We can fancy the strong satisfaction with which women would hail the quiet coming into their sick rooms of one of their own sex—a diplomaed and experienced woman; the effect of her mere presence in many cases would go half way to bring about the cure. We need not go into particulars in this argument; the truth of the statement will be generally admitted. In the case of children, too, the gentle and womanly care of a doctress would be the most efficacious and happy. We are convinced that the doctress, in managing her patients, would come better to the point and deal more directly and bluntly with the ailments of the young and the old of her own sex—or rather, let us say, the *less young*—than a man could do. She would be less complaisant and courtly, and more familiar in her treatment of them, and thus possess advantages which no medical practitioner of the other sex could hope to compete with. However we look at it, we must conclude that, for half the world, women would make better physicians than men. Nature seems to have decided that. And even for half the other half, we sometimes think the doctresses would be better than the doctors, in dealing with the griefs and evils of sick rooms.

And, coming from particulars to generals, we would contend that every woman, whether she designs to become a *medica* or not, should have a knowledge of medicine and its effects on the human system, of simples, salves and other useful empiricals. She should also have a general idea of chemistry. We do not know an accomplishment more suited to woman's place in the world than chemistry—not even excepting the piano-forte; for a knowledge of chemical mixtures is indispensable to those who would rightly understand the *materia medica*. Every mistress of a household or mother of a family should know something of these numerous and profitable facts that are to be gathered within the circle of that science; and, in the case of poisons, should be chemist enough to know what substances act on others, neutralizing them, and how to send an antidote at once after the bane; to send, for instance, down some beloved throat, soda and magnesia after acids, the whites of eggs, lime water or charcoal after arsenic, soap and water after corrosive sublimate, soda or lime after Prussic acid, milk and water after white vitriol, a solution of common salt after nitrate of silver, and so forth; making, at the same time, prompt use of the mustard emetic in the majority of such cases, and applying, with judgment, hartshorn, brandy or other materials, such as would be at hand in most households. A knowledge of these things, and with it a knowledge of other domestic recipes and resources, would be among the best and most admirable acquirements of a woman in any station of life; and it may be confidently asserted, that if it were skillfully practiced, on occasion, ten thousand homes would be spared the agonies and lamentations that constantly come, and will come, to darken their doors and windows. Women would be armed for the most trying emergencies, and be able to save the lives of those dear to them, instead of screaming and wringing their hands, and feeling bitterly that "ignorance is the curse of God." And, in a general way, a knowledge of the laws of health would make every

woman the protecting genius of her household, and teach her how to treat her children in any sudden or ordinary case of sickness or accident. Especially as regards children, every mother should be a doctress. The ignorance of parents is fatal to almost half the children that come into the world; it is more deadly and deplorable than the vices of adult years—than "battle, murder and sudden death." It is a melancholy thing to see the physical preservation and training of young children in the hands of those to whom persons of judgment would not entrust the life of a kitten. Women now-a-days are for the most part unprepared by education to act their parts well in their most important sphere—that of home. Their grand-mothers and great-grand-mothers and so, still further back, were much more accomplished in everything that truly becomes a woman to know. They had a knowledge of a great many useful things—knew excellent recipes in cookery and chemistry, were learned in the virtues of herbs and decoctions; and, "puddering with physic," like Lord Verulam, were generally aware of the efficacies of domestic medicine. They were prepared for most accidents, and nothing—if we except gun-shot wounds or the burning of the house—could have the effect of putting them to a *non plus*. Their fair descendants, compared with such excellent examples of house-wifery and skill, are, so to speak, Know-Nothings—which we greatly grieve to say.

We repeat—hoping there are many of our readers who will remember and improve the observations we thus hastily put before them—that a tolerable knowledge of medicine and an acquaintance with the nature of acids and alkalies, would be one of the most blessed accomplishments of the ladies—one of the richest dowries they could bring with them into the newly furnished houses of their husbands on the wedding-day; and that the regular practice of physic by the sex would have the best effect on the health, morally as well as physically, of the larger half of society. This science and profession need not take woman out of her own sphere. It demands no unsexing, like that which would belong to Bloomerism and the ballot-box. It leaves to the sex all that ever made it charming—and would only add to the attractions of Venus the grave wisdom of Pallas. Without making any violent strides over a barrier which must always remain, woman, in her own becoming way and attitude, may find in the theory and practice we speak of the best means of putting herself as near the level of the man as she can ever reach, and thus gratify the highest ambition she may be willing to entertain. As the physicians of more than a moiety of creation, and the intelligent mentors and preservers of their households and families, we have no doubt that, in the course of time, women will vindicate in a nobler way than they have yet done, their claim to be styled the better half of the world.

DESPERATE RENCONTRE.—We learn that a remarkable fight occurred in Amsterdam, in this county, a few days since, between an eagle and an owl. The eagle seized upon the owl, but found his prey too weighty to be carried off, and in the scuffle, the owl fastened his claws in the eagle's thigh, and held his enemy so tight as to make it impossible for him to escape. While in this condition, a gentleman passing by, hearing the scuffle, approached and easily captured both the combatants. We learn that the owl was one of the largest of his species, and the eagle measured over six feet across the wings. [Valley (Va.) Whig.]

We may live without a brother, but not without a friend.

Scrap-Book.

GOOD NIGHT.

Good Night! a word so often said,
The heedless mind forgets its meaning;
'Tis only when some heart lies dead
On which our own was leaning,
We hear in maddening music roll,
That last "good night" along the soul.

Good night!—in tones that never die,
It peals along the quickening ear;
And tender gales of memory
Forever waft it near,
When stilled the voice—O crush of pain!
That ne'er shall breathe "good night" again.

Good night! it mocks us from the grave—
It overleaps that strong world's bound
From whence there flows no backward wave;
It calls from out the ground,
On every side—around—above—
"Good night," "good night" to life and love!

Good night! O, wherefore fades away
The light that lived in that dear word?
Why follows that good night, no day?
Why are our souls so stirred!
O, rather say, dull brain, once more,
"Good night! thy time of toil is o'er."

Good night!—no cometh gentle sleep,
And tears that fall like gentle rain,
Good night! O, holy, blest and deep,
The rest that follows pain,
How should we reach God's upper light,
If life's long day had no "good night."
[Chambers' Journal.]

LICENSED! TO DO WHAT?

BY REV. MR. ROOD.

Licensed to make the strong man weak;
Licensed to lay the wise man low;
Licensed a wife's fond heart to break,
And make her children's tears to flow.

Licensed to do thy neighbor harm;
Licensed to kindle hate and strife;
Licensed to nerve the robber's arm;
Licensed to whet the murderer's knife.

Licensed thy neighbor's purse to drain,
And rob him of his very last;
Licensed to heat his feverish brain,
Till madness crowns thy work at last.

Licensed, like spider for a fly,
To spread thy nets for man, thy prey;
To mock his struggles—suck him dry—
Then cast the worthless hulk away.
[Christian Chronicle.]

CUTTING.—The following lines, by the Boston Post, on the marriage of Thomas Hawk to Sarah J. Dove, are rather sharp:

It isn't often that you see
So queer a kind of love!
O what a savage he must be,
To Tommy-Hawk a Dove!

BANKS.—A "good 'un" is told upon the authority of a high judicial functionary. The wife of the owner of one of the Indiana free banks being in company with some friends, the all-absorbing financial crisis became the theme of conversation. The lady above referred to, remarked that she hoped her husband's bank would "hold out till the fall rains come on—in that case there would be no danger of its breaking before next May." When interrogated for an explanation, she gave as a reason for the faith that was in her, that the place in which the Bank was located could not be approached after the fall rains, on account of the mud.
Ohio Statesman.

WHEN you speak to a person, look him in the face.

HARD WORK.

Mr. A.—"Good morning, Mr. B.; I called to see if you wanted a clerk. I should like to put my son into your store for a while."

Mr. B.—"Indeed, I thought you needed him on your farm."

"So I do need him—but I don't want my children to have to work as hard as I have had to—digging and delving. I tell you it's too hard; I'm fairly worn all out."

"Ah! but you look more hale and hearty than the most of us, and yet you must be quite as old."

"Yes, I am turned of 70. But I grow lame and stiff, and it's all from hard work."

"Over 70? And I am but 60, and my partner younger still—yet see our gray hairs."

"Well, well—something in families about that, may be. But do you want my boy?"

"No sir."

"Why not?"

"Because you want to put him here to live easy, and he'll be good for nothing, as clerk or merchant either, in that way. We merchants have to work hard if we would gain anything; and we have to work a great many more hours in a year than you do."

"Yes, yes, more hours perhaps—but the work isn't half so hard. Here you are in a cool room in summer and a warm one in winter, while we are exposed to heat and cold, wet an dry."

"I know it looks so to you. But now do you go into a room and spend all one long day walking it from side to side, dodging this way and that, and see if long before night you do not want to get out of prison; see if you are not tired enough before supper time to be glad to sit down in the evening with your family and your newspaper. But no, you must go back to your prison, and dodge and jump all the evening harder than ever. And when bed-time comes, you must post books."

"Oh, you tell it all on your side. But suppose it is so—you made money, and when old age comes on, you can retire from business and live easy."

"Not a whit better than you can. I thought as you do once, and tried it. I thought I could give up the confinement and labor, and only oversee. But this did not give me ease or leisure; so I got a head clerk and retired, as you call it—and what was the result? Why, I failed. And what did you and everybody else say? Why, I had 'quit work and tried to be a gentleman, and no wonder I smashed—it was good enough for me—I might have kept at work like other folks.'"

"I know such things were said, but we didn't know you heard of them! But now just look at the poor farmer's crops this summer—half dried up. Just think of such losses after all our labor."

"Yes, and the day laborers too, who are out of work in consequence of the unfavorable season, will all fall upon me to knock off 'just a little of their store accounts, because everything they buy of the farmer comes so high'—and I must do it too, or be 'such a stingy tight Jew they'll never go there to trade again,' to say nothing of those that go off without paying at all."

"Well, I suppose merchants do have losses as well as farmers. But it seems as if you didn't have half so many vexations—showers coming up—tools breaking—cattle in the corn, and what not."

"Vexations! You know nothing about it. Come here and wait upon ungoverned children—try to satisfy an old woman that a ten cent calico won't fade—lower the price of a pair of shoes or a plug of tobacco to suit an Irishman—find something nice enough for a fashionable young lady—grave enough for a quaker—gay enough for a darkee—styl-

ish enough for a dandy—and can't suit one of them till they have 'looked somewhere else'—and you may fold up and pile up your goods to be ready for the next unsatisfactory set. Mr. B., you know nothing about vexations. No wonder we grow bald and gray before our time."

"And so you are sure merchants have the hardest of it. But I don't know what to do with my boy. He thinks farming too hard, and he don't like to go to a trade—feels—well, I don't know."

"I know, my friend. You have taught him to feel that a trade is too low, and farming too hard, and now he is half spoilt for being successful in anything."

"I wish I could get him into a bank with a salary—he'd like that. I tried hard for it last week; but they ask such an awful sum for bonds; I don't see what that's for."

"Mr. B., you sometimes pray for yourself and your children, 'Lead us not into temptation—but here you are, trying to get your only son into a situation where the temptations and the facilities for dishonesty are so great that those best acquainted with the business find it necessary to put every one under heavy bonds before he can be trusted with it. Now, my good friend, take my advice and keep your son with you. He need not 'dig and delve' as hard as you say you have done, and make such haste to be rich, for you have made a large property; but learn him to work reasonably and take the comfort of it as he goes along; not put off enjoying it till old age. That is the secret of happiness. 'A little with contentment is great gain;' just as good as great wealth."

Pittsfield Cultivator.

THE POET PERCIVAL.

THIS gifted man long since disappeared, like a meteor from the sky. The Louisville Journal thus recurs to his singular retirement:

"Self-immured in a room of the hospital in the extreme suburbs of New-Haven—a city of which a poet should be proud—this gifted and eccentric being lives, as he has lived for the last quarter of a century, a purely solitary and ascetic life. He is wholly absorbed in intellectual pursuits, and shrinks with painful sensitiveness from all the luxuries and amenities of life. No Eastern anchorite ever abjured more completely the comforts and refinements of elegant rank for the blank privations of his cell—no storied recluse ever more voluntarily renounced a brilliant career of usefulness and fame for the lonely vigils of a hermitage. In this desolation, rejoicing, it is said, in but a single chair, he has surrounded himself with a magnificent library and with philosophical apparatus, from which friend and foe are alike excluded, and in which, though dead to all beside, he seeks and finds the solace and charms of intellect."

ARKANSAS INSECTS.—A citizen of Arkansas while on board of a steamer on the Mississippi, was asked by a gentleman, "whether the raising of stock in Arkansas was attended by much difficulty or expense?" "Oh, yes, stranger—they suffer much from insects." "Insects! Why, what kind of insects, pray?" "Why, bears, catamounts, wolves, and such like insects."

THE hen-pecked husband is happy enough if he were only left alone; but he generally has some kind friend, who is perpetually urging him "not to stand it."

MAKE few promises, and live up to your engagements.

"SHE ALWAYS MADE HOME HAPPY."

Such was the brief but impressive sentiment which a friend wished us to add to an obituary notice of one "who had gone on before."

What better tribute could be offered to the memory of the loved and lost? Eloquence with her loftiest eulogy—poesy with her most thrilling dirge, could afford nothing so sweet, so touching, so suggestive of the virtues of the dead, as those simple words: "*She always made home happy.*"

Hear this, mothers, wives, and daughters, and think of your own duty. How many could have the same said of them with truthfulness and sincerity? Ask that woman whose splendid residence attracts the gaze of every passer by. Thousands have been lavished on these imposing walls, long colonades and high arched windows; and now and then you obtain a glimpse of costly hangings, rich carpets and tall mirrors, which dazzle with their magnificence. Often you pause a moment, and look wistfully in through the half-closed blinds and murmur to yourself as you pass on: "I should think the possessor of all this might enjoy life."

But you are sadly mistaken. The love of peace never folds her white wings by that fireside; the gentle spirit of content never sheds her holy influence there. The master of the mansion, though yet in his prime, seems prematurely old; there is an expression of habitual suffering around his firmly compressed lips, and his broad brow bears many a trace of care. Ah! there is a vulture at his heart, which, like the hero of the olden story, he would fain conceal. Ten years ago he married a beautiful girl, with a thousand pleasant visions of domestic quietude and bliss. But his dreams have faded; the rosy hue of romance is lost in the cold, gray dawn of his bitter reality.

His wife presides over his household with surpassing gracefulness; she is the idol of society, and a leader of fashion. She goes and comes through those spacious halls, dressed in garments that might befit a queen; she gives brilliant dinners where she shines the brightest star, and parties which everybody pronounces *charming*. But she is never the kind, devoted companion—the loving, trusting helpmate, sharing every joy and sorrow, cheering him when he desponds, and counseling in trials and perplexities with winning grace and tenderness. In short, she never makes home happy. But it is not alone to the frivolous that our subject speaks the language of reproof and instruction; there are others to whom it may be applied with equal force. Ask the would-be-reformer of the nineteenth century, whose loftiest aim is to step beyond the appropriate sphere, how she performs her duty in this respect. She is often seen in the debating hall and lecture room, where strife and confusion prevail. Her voice is heard ringing out in defense of the *rights* of her sex; she allows her name to be bandied about, linked with the coarsest epithets; she takes long and tedious journeys in behalf of the cause she has espoused. You may hear her talk enthusiastically of all that is pure and elevating in woman's mission and sublime in her destiny. Indeed, she appears ready to suffer any hardship or privation, if she can only aid in the glorious work of redeeming oppressed females from their terrible thralldom.

But you do not find her the "bright presiding genius of her home." Her smile and cheering welcome do not greet her husband when he returns from his daily toil; her hands do not draw his arm-chair to that favorite nook; her society does not charm away his weariness and make him forget his cares. When he is ill, she is seldom near to smooth his pillow, or bath his fevered cheek, or whisper of hope and consolation.

Can it be, that she, with all her *pretended* regard for the best interests of humanity, even realize her own responsibility? Alas! we fear not.

Ask the peevish complaining wife, if she has ever thought seriously of this matter. What a neat, cosy little cottage her's is! How many comforts she has. Her two noble looking boys and their fair sister are as beautiful a trio of children as ever graced a household; her husband is kind and indulgent, but her fretful disposition will not allow her a moment's tranquility. She is in perpetual anxiety; sometimes it is one thing and again another that causes her inquietude, but she is never at rest. The children yearn for the sunshine, which they see in the homes of their playmates, and invent all kinds of excuses to get away from troubles that haunt their mother. They have already learned that pleasure can not be found under their own roof-tree, and the gambling-hall, the theater, and the club-room hold out temptations which they can scarcely resist. Aye, think of these solemn considerations and be wise.

"She always made home happy." What more fitting inscription can be engraven on the tombstone of the estimable woman of which this was said? It will stand, perchance, in some church-yard, where birds warble, and flowers open their starry eyes, all unmindful of the sweet sleepers below. Other monumental tablets will rise around it, bearing the high sounding epitaph, but nothing there can speak a sweeter lesson than the brief sentence, "She always made home happy."

SPELLING SCHOOLS.

How many "grown up" people can enter fully into the spirit of the following sketch of a country Spelling School. We well remember when, in our boyhood, there was no higher object of our ambition than to be the champion who had been from three to a dozen miles on an ox sled, and "spelled down" a rival school. Whole weeks and months were passed in seeking for new words, and spelling over and over all the old ones, so as to be ready for the contest. We are now reaping the advantages of such labor, and we could heartily wish our present boys were subjected to some such drilling; for in our present system of training, especially in "select schools," this important acquirement is too little regarded. We are safe in saying that, of all the students in our colleges and academies, not one half of them can spell even respectably.

The school in the Quaker neighborhood have sent a challenge, in due form, to this district, to spell; so to-night "the war of words" is to be waged in the white school-house on the hill.

There is a great over hauling of old Elementaries, and a wonderful burnishing up of frontispieces, and turning over of clean collars, preparatory to the grand melee.

Spelling schools! Have you forgotten them? When, from all the region round about, they gathered into the old log school-house, with its huge fire-place, that yawned like the main entrance to avenues. How the sleigh-bells—the old fashioned bells, big in the middle of the string, and growing small by degrees and beautifully less, toward the broad brass buckle—chimed, in every direction, long before night, the gathering of the clans.

There came one school, the Master—give him a capital M, for he is entitled to it—Master and all, bundled into one huge, red, dou-

ble sleigh, strewn with abundance of straw, and tucked up like a Christmas pie, with a half score of Buffalo robes. There half a dozen cutters, each with its young man and maiden, those two, and no more.

And there, again, a pair of jumpers, mounting a great, outlandish looking bin, heaped up, pressed down, and running over, with small sections of humanity, picked up en route, from a great many homes, and all as merry as kittens in a basket of wool. And the bright eyes, and ripe, red lips, that one caught a glimpse of beneath those pink-lined quilted hoods, and the silvery laughs that escaped from the woolen muffles and fur tip-pets they wore then—who does not remember? who can ever forget them?

The school-house destined to be the arena for the conflict, has been swept and garnished; boughs of evergreen adorn the smoke-stained and battered walls. The little pellets of chewed paper have been all swept down from the ceiling, and two pails of water have been brought from the spring, and set on the bench in the entry, with the immemorial tin cup, a wise provision, indeed, for warm work is spelling!

The "big boys" have fanned and replenished the fire, till the old chimney fairly jars with the roaring flames, and the sparks fly out of the top like a furnace.

The two "Masters" are there; the two schools are there, and such a hum, and such a moving to and fro! The baten comes down upon the desk with emphasis. What the roll of the drum is to armies, that the "ruler" is to this laughing, whispering, young troop. The challenged are ranged on one side of the house; the challengers on the other. Back seats, middle seats, low, front seats, are filled. Some of the fathers and grand-fathers, who could, no doubt upon occasion,

"Shoulder the crutch, and show how fields were won," occupy the benches of honor near the desk.

Now for the preliminaries; the reputed best speller on each side "chooses." "Susan Brown!" Out comes a round-eyed little peony. Who would have thought it! Such a little thing, and chosen first.

"Moses Jones!" Out comes Moses, an awkward fellow, with a shock of red hair, shockingly harvested, surmounting his broad brow. The girls laugh at him, but what he doesn't know in the Elementry isn't worth knowing.

"Jane Murry!" Out trips Jane, fluttered as a bride, and takes her place next to the cellar. And as they go on, calling names until five or six champions stand forth to do battle, and the contest is fairly begun. Down goes one after another, as words of three syllables are followed by those of four, and these again by words of similar pronunciation and divers significations, until only Moses and Susan remain.

"The spelling-book has been exhausted, yet there they stand. Dictionaries are turned over—memories are ransacked for

"Words of learned length and thundering sound," until, by and by, Moses comes down like a tree, and Susan flutters there still, like a little leaf aloft, that the frost and the fall have forgotten.

Polysyllable follows polysyllable, and, by and by, Susan hesitates just a breath or two, and twenty tongues are working their way through the labyrinth of letters in a twinkling. Little Susan sinks into the chink left for her on the crowded seat, and there is a lull in the battle.

Then, they all stand in solid phalanx, by schools, and the trouble is to spell each other down. And down they go like leaves in winter weather, and the victory is declared for our district, and school is dismissed.

Then comes the hurrying and bundling, the whispering and glancing, the pairing and the

tumbling-in. There are hearts that flutter and hearts that ache; *mittens* that are not worn, secret hopes that are not realized, and fond looks that are not returned. There is a jingling among the bells at the door; one after another the sleighs dash up, receive their nestling freight and are gone.

Our Master covers the fire, and snuffs out the candles—don't you remember how daintily he used to pinch the smoking wicks, with forefinger and thumb, then thrust each hapless luminary, head first into the tin socket?—and we wait for him.

The bells ring faintly in the woods, over the hill, in the valley. They are gone. The school house is dark and tenantless, and we are alone with the night. [January & June.]

CROWDED ACCOMMODATIONS.—The reporter of the Cincinnati Commercial gives the following account of the accommodations at Newark, Ohio, when the State Fair was there:

"No one can for an instant consider fifty cents an exorbitant demand for sleeping on a fence-rail and using a yard of tape for a coverlid, when he reflects for a moment that it is his *dernier resort*. Nor can he complain of the peculiar durability and firmness that characterizes the beef, and the disposition of the anatomical parts of the boiled chickens, (cooked three weeks in advance, in order to be ready for any emergency,) to adhere to each other. He can not allow one groan to escape when he gazes upon the butter on the table and sees its many shades and hues, for as an antiquarian he can admire a rare collection of the mediæval ages, and as a lover of his country he believes in the old saw, 'In union there is strength.'"

A VERMONT ITEM.—The butter and cheese received at the Railroad station in St. Albans during the month of September, says the Burlington Free Press, amounted to over half a million pounds, the total value of which was \$75,000.

The closing of the New-York Canals is officially announced to take place on the 5th of December. The season is described by the Rochester Union as having been a dull one for all connected with the navigation of the Canals.

MAKE no haste to be rich, if you would be prosperous.

CHINESE PIGS AND MISCELLANEOUS POULTRY.

We know not that we have ever seen so fine and so extensive a collection of poultry as on the farm of Messrs. B. & C. S. Haines, at Elizabethtown, N. J. The flocks, most of which were kept entirely separate at different localities, embraced some dozen or more distinct varieties of the most popular breeds, including the extremes of large and small, and many of the intermediate sizes. The Shanghais, Brahma Pootras, Chittagongs, Malays, &c., were the largest we ever saw, and very well proportioned withal; while the Bantams, of which there were no less than seven broadly marked and perfectly distinct varieties, were the merest mites of things, and as one now and then ran before the ponderous jaws of their great congeners, we expected to see it gobbled up like a beetle or grasshopper. Three varieties of game fowls, the Black Spanish, and the Leghorns, all of the choicest kinds, were among the best of their medium kinds for utilitarian purposes—eggs and the table.

When we add that Messrs. Haines have taken no inconsiderable share of the prizes at our National, State, and other Shows, we simply give a proof that their taste and selection coincides with that of the enlightened public.

We were particularly attracted by a pen of nearly a dozen China pigs, all of one litter, and though spotted, so nearly alike in color, form, and size, as scarcely to be distinguishable. This is the first litter from a pair sent by one of the officers of the Japan Expedition, direct from China, and the same animal hitherto so successfully used by Europeans and a few intelligent Americans, in refining the coarse breeds of swine. We hope these may become the means of extensive improvements to some of our own herds, that have not already established an honorable relationship with the Berkshires, the Suffolk, or Neapolitans.

Markets.

REMARKS.—Flour is 12½ to 25 cts. per bbl. above our last week's quotations. Corn has advanced 3 to 4 cts. per bushel. Wool brings a trifle better prices, and is more in demand. The stock on hand is light.

Cotton has fallen ½ cent per lb. Rice, Sugar, and Tobacco a slight decline.

The weather the past week has been mild for the season, and several days rain. We hope the streams over the whole country are now full, and that there will be no want of water, even if a hard winter sets in; but it seems to be the general opinion of the weather-wise, that the winter will be mild with plenty of rain.

PRODUCE MARKET.

SATURDAY, November 25, 1854.

The prices given in our reports from week to week, are the average wholesale prices obtained by producers, and not those at which produce is sold from the market. The variations in prices refer chiefly to the quality of the articles.

There is considerable activity in the market this morning, after the rain, notwithstanding the mud. Potatoes manifest little change, good Mercers being scarce and commanding high prices. Inferior kinds are very plentiful. The same may be said of Apples.

In the Butter market we make no change in price—though it is rather dull. Large quantities come in from this State and from the west, to close the fall trade. Eggs, and Cheese, same as last week.

VEGETABLES.—Potatoes, New-Jersey Mercers, \$3@3.50 per bbl.; White, \$2.25@2.75; Carter, \$2.50@2.75; Nova Scotia, 80c.@\$1 per bush.; Western reds, \$2 per bbl.; Sweet, Philadelphia, \$3.50@3.75; Virginia, \$3.25@3.50; Turnips, Russia, \$1.25@1.50; White, \$1@1.25 Onions, White, \$4; Red, \$1.50@2; Beets, \$1.25 per bbl.; Parsnips, same; Carrots, \$2.50 per 100 bunches; Cabbages, \$5@7 per 100; Celery, 75c.@\$1 per dozen.

FRUITS.—Apples, Spitzenbergs, \$2@2.25 per bbl.; Greenings, \$2@2.25; Russets, \$1.50@2; Baldwins \$1.50@1.75; Cranberries, \$6.50@8.50.

Butter, Orange Co., 21@24c. per lb.; Western, 15@17c.; Eggs, 23@24c. per doz.; Cheese, 10c.@11c. per lb.

NEW-YORK CATTLE MARKET.

FRIDAY, NOV. 24, 1854.

The number of cattle in market yesterday was seven or eight hundred less than the previous week, and yet there was no improvement either in sales or prices. On the contrary, we have rarely seen so dull a market. This cannot be owing to the quality of the animals offered, which were certainly not below ordinary.

The fact is, there was a manifest backwardness on the part of the butchers, in consequence of the new arrangement, which they are determined, if possible, to upset

Some of them, we understand, bought of their stock (or attempted to) early yesterday morning, at the landings, while others were resolved not to buy at all. Many, it is said, would prefer Wednesday, but this the brokers object to—as before stated—on account of the Philadelphia market being held on that day.

We are glad to learn that any day is preferred to Monday, and doubtless when things become settled, both parties will yield to what is manifestly for the public good.

There is no doubt that the present hard times influence the markets as much as any thing. Both owners, drovers and butchers are under considerable liability to each other, and so long as this continues, we may not hope for either large sales or active markets.

Best quality is selling at 9½@10c. per lb.
Fair do. do. 8½@9½c. do.
Inferior do. do. 7@8c. do.
The following are about the highest and lowest prices:
Beeves 7c.@10c.
Cows and Calves \$25@45.
Veals 4c.@6c.
Sheep \$2@6.
Lambs \$1.50@5.
Swine 4½@7½.

Mr. Browning reports beeves, 7c.@9c.; cows and calves, \$25@50; veals, 4½c.@6½c.; sheep \$2.50@5; lambs, \$1.50@4.

Mr. O'Brien reports beeves, 7c.@9c.; cows and calves \$25@45; veals, 4½c.@6½c.

RECEIVED DURING THE WEEK.

New-York State furnished, by cars, 354; on foot, 99;
Ohio, 78; Kentucky, 45; Illinois, 221; Pennsylvania, 424; Virginia, 155.

MONDAY, NOV. 27.

We visited the Washington Yards this morning, but found nothing doing worthy of mention. Several brokers and butchers were present, speculating on the late change and the probable issue. What that will be, it is as yet difficult to determine. It will be hard to come to any conclusion which will satisfy all parties.

SHEEP MARKET.

Monday, Nov. 27, 1854.

The Sheep Market this morning is a little more favorable, which is all that can be said. It was altogether over-stocked last week, and a large number left over. Much of it is not of the choicest specimen. At Chamberlain's there were ten or fifteen hundred left over. The stock on hand to-day is not large, and the market somewhat better.

The following are the sales by James McCarty, sheep-broker, at Browning's:

33 Poor lambs.....	\$63 62
67 Sheep.....	184 25
137 ".....	376 50
43 Lambs and sheep.....	150 50

VALUABLE REAL ESTATE for SALE

AT A BARGAIN.—The subscriber offers for SALE, at a great BARGAIN, and in lots to suit purchasers, several hundred acres of LAND, situated in one body within four and a half miles of Sunderland Depot, 47 miles from Troy, on the Troy and Boston Railroad. On the premises are a comfortable Dwelling House; a large Barn and Shed; Sixty Acres of MEADOW, and about One Hundred and Ninety Acres of Pasture Land. The most of the remainder is heavily wooded, containing immense quantities of valuable timber, with an easily accessible Saw-mill near at hand, so that there is a fine opportunity for profitably getting out timber for market. The greater portion of the land is tillable. Also, adjoining the above, about Fifty acres, containing Mill Pond. This lies in Sandgate, Vermont. For further information address R. GRAY, 64-69n1139 Shushan Post-office, N. Y.

ISABELLA AND CATAWBA GRAPE

VINES, of proper age for forming Vineyards, cultivated from, and containing all the good qualities which the most improved cultivation for over fourteen years has conferred on the Croton Point Vineyard are offered to the public. Those who may purchase will receive such instructions for four years, as will enable them to cultivate the grape with entire success, provided their locality is not too far north.

All communications addressed to R. T. UNDERHILL, M. D., New-York, or Croton Point, Westchester Co., N. Y., will receive attention. The additional experience of two past seasons, give him full assurance that, by improved cultivation, pruning, &c., a crop of good fruit can be obtained every year, in most of the northern, and all the middle, western, and southern States.

N. B.—To those who take sufficient to plant six acres, as he directs, he will, when they commence bearing, furnish the owner with one of his vineyarders whom he has instructed in his mode of cultivation; and who will do all the labor of the Vineyard, and insure the most perfect success. The only charge, a reasonable compensation for the labor. R. T. U. 64-67n1140

APPLE QUINCE SEED—A prime arti-

cle for stocks—for sale by WM. DAY, 63-66 Morristown, N. J.

A PROPOSITION.—For the use of \$600

I will BOARD a young Lady or Gentleman, who may wish to educate themselves at Antioch College, Yellow Springs, Ohio. Any one having that amount to spare, can get an education and have the money returned any time after two years. Others boarded at \$2 to \$2 50 per week, from the first of April. Yellow Springs is one of the most healthy and pleasant villages in the West. Address J. J. Lumberton, Ohio. 63n1138

TO HORTICULTURISTS.—A person

who has been engaged in Horticulture for the last twelve years, will shortly be disengaged, and desires a situation in an extensive Nursery or in connection with a Horticultural or Agricultural Periodical. Can give satisfactory reference as to ability, &c. Address S. Kingessing, P. O., Philadelphia Co., Pa. Refer to A. B. Allen, Office of the American Agriculturist. 61-73

A PAIR OF FINE COACH HORSES for

SALE.—Sixteen hands high, long tails; one six, the other seven years old; color gray. These horses are warranted kind, sound, strong, and enduring. They are offered for sale for no fault, but simply for not wanting their use the ensuing winter. They can be had for \$350, which is very cheap for them. Such horses are often sold at \$500 or \$600 in this city. Apply to F. WOODFORD, 191 Water-st., N. Y. 60-61

CHOICE POULTRY.—C. C. PLAISTED,

of Great Falls, N. H., (late partner of Dr. John C. Bennett,) now offers for sale a large lot of choice POULTRY, viz:

Four trios of Brahma Poultry, last year's fowls, from \$12 to \$18 a trio; 30 pairs of Chickens, from \$6 to \$10 a pair; bred from the Brahmas exhibited by Bennett and Plaisted, at the National Poultry Show, February last, and which were premium fowls. (Mr. P. has just sold the cock alone for \$50, to F. B. Bernard, of New-Orleans, La.) One trio of Hong Kongs, last year's fowls, price \$15; 4 pairs of Canton Cochins China Chickens, price \$8 a pair; 3 trios of Black Shanghai, price \$10 a trio; White Shanghai \$6 a pair; 20 pairs of Sumatra Pleasant Games—splendid fowls—at \$6 a pair; a few pairs of Malacca Games, at \$10 a pair; also English, Irish, Spanish, and Indian Games, at \$6 a pair, and one pair of very large Hong Kong Geese, price \$20.

N. B.—The above lot of Fowls are all PURE BRED, and warranted as such. They are only offered at such very low prices because I have not room to keep so many through the winter.

Money may be sent at my risk, if inclosed and mailed in the presence of the Post-master. 62-63

IMPROVED SHORT HORN BULL FOR

SALE.—The subscriber offers for sale his superior Short Horn Bull, PRINCE ALBERT, that won the second prize at the recent State Fair held in the City of New-York.

Prince Albert was calved in 1849; his pedigree is of much merit; in color, he is a deep red with white marks; intemper, extremely mild and easily managed. He is an excellent stock-getter, and would not now be offered for sale, but that the subscriber, in the system of breeding he has adopted, has no further need of his services.

Under these circumstances, he is for sale at the low price of three hundred dollars. The animal may be seen at Ellerslie farm, one mile south of Rhinebeck station. Address personally, or by letter, WILLIAM KELLY, Ellerslie, Rhinebeck. 60-61

ANDRE LEROY'S NURSERIES, AT

ANGERS, FRANCE.—Mr. Leroy begs to inform his numerous friends that he is now prepared to execute all orders for TREES, EVERGREENS, SHRUBS, STOCKS, &c., entrusted to his care.

His Trees, &c., are very fine this year, and his collection very complete. Orders should be sent, so as to secure the different kinds. The best care will be given to all orders as usual. The Angers Quince Stocks have not succeeded well this year, and are scarce and high.

Orders should be, as usual, addressed to our agent in New-York, Mr. EDWARD BOSSANGE, No. 138 Pearl-st., who will give all the information desired, and mail, on application, free of charge, a detailed copy of my catalogue, with prices, in dollars and cents. 60-72

TREES AND PLANTS.—PARSONS &

CO., Flushing, near New-York, offer for sale their usual assortment, with the addition of many rare novelties of Fruit Trees, for the Orchard and the Garden; Ornamental Trees, Shrubs, and Roses, for the Avenue, Lawn, or Cemetery; Vines for the Graperies; and Exotic Plants for Greenhouse culture. Catalogues can be obtained at No. 60 Cedar-st., or will be sent by mail to all post-paying applicants enclosing a postage stamp. 23-71

1,000 ORNAMENTAL TREES FOR

\$100.—Suitable for Belts, Masses, Shrubberies, Woods, &c., in the best and hardiest varieties, strong and well grown—delivered in Boston and New-York. Price list on application. B. M. WATSON, 56-63 Old Colony Nurseries, Plymouth, Mass.

RASPBERRY PLANTS, of the PURE

RED ANTWERP stock, for sale in quantities to suit purchasers. The Plants are all warranted, and in a thrifty condition, and will be delivered in New-York for \$30 per thousand. VALENTINE H. HALLOCK, Poughkeepsie, N. Y.

P. S.—Orders by mail will be promptly attended to, and no charge made for package. Orders to R. L. ALLEN, 189 and 191 Water-st., N. Y., will receive prompt attention. 60-61

MULES FOR SALE.—The subscriber

keeps constantly on hand 400 to 500 MULES, of all sizes. Among these are some of the choicest animals in the United States; 16 hands and over in height, and well proportioned.

Mules are almost the only working animals used in portions of the Southern States, the West India Islands, and Spanish possessions, where severe work and hard usage are allotted them, and under which horses would soon die. An equal advantage would follow their introduction among farmers and others, in the northern States. They are not only much harder than horses, but they will draw more in proportion to their weight; will endure a great deal more; live twice as long, and eat less; and the only dressing or currying they need, is a soft pelican roll on. They are gentle, tractable, and easily managed; and nobody who has ever tried them will ever give them up for horses or oxen.

Call on, or address by letter, JAMES BUCKALEW, Jamesburg, New-Jersey. Refer to Amos Chamberlain, Bull's Head, 24th-st., N. Y. 59

SUPERIOR SEED WHEAT.—A LARGE

assortment of the best varieties of improved Seed Wheat; among which are the Red Mediterranean, White Mediterranean, Soule's and Blue stem. For sale by R. L. ALLEN, 189 and 191 Water-st.

FANCY FOWLS FOR SALE.—A variety

of pure bred Fowls, Asiatic, Spanish and Game Fowls, Sebright, Black African, Antwerp, and other Bantams. B. & C. S. HAINES, Elizabethtown, New-Jersey 51-61

PERUVIAN GUANO.—First quality of

Fresh Peruvian Guano, just received in store. R. L. ALLEN, 189 and 191 Water-st.

WILLARD FELT, No. 191 Pearl-street,

(near Maiden-lane,) Manufacturer of Blank Books, and Importer and Retailer of PAPER and STATIONERY of every description. Particular attention paid to orders. 26-77

MACHINE WORKS.—M. & J. H. BUCK
